Some persons sedulously devoted to other branches of the study of Classical antiquity are deterred from availing themselves of the aid of coins by a fear of being imposed upon by forgeries. Although forgers may be clever, detectors are clever also. The numismatic phalanx of investigators are more than a match for the "falsarii." The skill of Cavino, Gambello and Cellini has been met with equal skill on the part of the numismatist. The eye that has been accustomed to wander over a well-selected cabinet acquires a power of ready discrimination—a power difficult to teach by theory, but not so difficult to gain by practice. Solitary instances may occur of a solitary numismatist fondly persuading himself that some clever forgery which he possesses is a genuine coin, but we would not give much for his chance of beguiling others into the same belief. Unwilling he may be to have the "gratissimus error" extracted from his own mind, but he never will succeed in engrafting it upon others. Never does the eye of man exert so much jealous vigilance as when it is employed upon the coin of a rival numismatist claiming to be genuine upon insufficient grounds. The House of Lords sitting upon a claim of some peerage in abeyance is nothing to it. We apprehend that scarcely an instance is on record of a forged coin having enjoyed for any length of time unquestioned the honours of a genuine one. Nor do we think that there are many instances of a forger's attempting to falsify history. He generally aims at making his invention tally with historical fact as closely as he can. And if his inventive powers are not at all brought into exercise, but he simply produces a coin which is a facsimile or reproduction of a genuine one, for purposes of study that facsimile will be equally available with the genuine coin, and no further harm is done than the abstraction of a few shillings more than its value from the pocket of the unwitting purchaser. At the same time we would not let the forger go unpunished. Though the evil actually done be small, the intention is bad. We would have him tried by a jury of numismatists. Or if the offence should have been committed in a country where the power of punishing the offence resides in one magistrate, we should say that that one magistrate ought to be a numismatist. It is said that a distinguished archæologist who possessed this power in virtue of his office as Her Majesty's consul at Bagdad, exercised it by directing that a "falsarius" should be bastinadoed. The man who had counterfeited the famous sequins of Venice and had aggravated his crime by doing it badly, "che male aggiustò 'l conio di Vinegia," is represented by Dante as worthy of an especial notice among those sinners against laws divine and moral with whom he has peopled the shades of his "Inferno." Seriously, however, we think that any clever work of art is worthy of being preserved, and none the less for its having taken in some who set themselves up as judges. Even in Pliny's time a counterfeit denarius of superior workmanship was sometimes thought cheap at the price of sundry genuine denarii. The tasteful device of Cellini or of some cunning artist of Padua must not be thrown to the dogs merely because it was produced with the intention of rivalling the work of ancient artists and of testing the acumen of the cognoscenti. Those figures of Cellini, for instance, which some one brought and exhibited to the artist himself as antiques, and respecting which the nobleman who was their proprietor declared, when he saw a smile playing upon the conscious visage of Cellini, that there had not lived a man for these thousand years who could have wrought such—would not those figures have been worth preserving? And in like manner a coin which, by the excellence of its workmanship, has raised a doubt whether it may not have been really of ancient origin, ought by no means to be treated with contempt, even though it proves to be modern.

The Exhibition of the Society of Painter-Etchers and Engravers will be opened on Monday next.

NOTES AND COMMENTS.

The greatest powers in nature are invisible, and, it may be added, intangible. Nobody has ever seen steam until combined with air; the gases are also incorporeal, and although it is possible to be shocked and slain by electricity, we cannot behold what is so useful and so dangerous. If this fact is realised, it will then be found that many of the terms employed in referring to the forces are altogether figurative. As such they must be open to doubts when they are used in law cases. For instance, on Tuesday last it was asked whether electricity is an "article" within the meaning of the Factories Act. The Bilston District Council produce the electricity required for lighting the town. The inspector of factories, therefore, considered that an abstract of the Factory and Workshops Act should have been affixed at the entrance for the information of the workmen, and he summoned the Council for their neglect. The Clerk denied that electricity was an "article," whilst the inspector maintained the contrary. Doubts were also expressed as to whether the building was a factory, as the Council were not a trading corporation, and it was equally legal for them to prepare electricity as it would be for any private individual. The supplementary questions could easily be determined, but the difficulty arose over the word "article." The stipendiary said the case must be adjourned for a fortnight in order that he might go through the needful research. If the word "article" originally signified a joint, it must therefore relate to a part of something, and other applications of the word to a whole are only a result of custom. It is now employed to designate "things in general." From its comprehensiveness and vagueness it was no doubt introduced in the Factory and Workshops Act. "Article" appears likely to attain as much universality as the Latin "ens," which Julius Cæsar is said to have invented; but it would be wise to introduce the word "power" in the Act in addition to article, which would make the clauses applicable to gasworks and hydraulic works of all varieties.

Outsiders cannot understand the tactics of the Operative Plasterers' Association, for the men appear to be rushing to a contest with the lightheartedness of an Emile Olivier. Judging by their replies, they claim all the privileges of children who have been spoiled, and when impertinent escape punishment. To declare that they have "no official knowledge" of abuses which are perpetrated by them is only trifling, and indicates that the negotiations have been conducted as a game. It is impossible for the National Association of Master Builders to come to terms with men so volatile. As there can be no assurance that the objectionable practices which the Association will not condemn are to be discontinued promptly, the masters were justified in declaring that there must be a lock-out on March 6. There is time for the plasterers to show their seriousness by submission, but any further dallying with the case will only increase the evil. To be kind we are afraid the masters must show themselves to be severe.

On April 25, 1599, Oliver Cromwell was born in St. John's parish, Huntingdon. Carlyle describes the house in which the event took place as "a solid yellow brick house with a walled courtyard," and as he was unable to make more of it there is no doubt of its commonplaceness. It has been twice rebuilt, and originally may have possessed some comeliness In a couple of months will come the tercentenary of the Protector's birth, and according to the modern custom there are proposals about celebrating it. Huntingdon is not yet entirely reconciled to Cromwell's way of overcoming a political difficulty, but the modern cavaliers would not object to any expenditure by their puritan friends on an object that would benefit the town. The governors of the Grammar School, for example, desire to obtain money to expend on additional buildings, class-rooms, a laboratory, scholarships, &c. The school was part of a hospital founded in the twelfth century, and there, according to Carlyle, the young Cromwell "learned to appearance moderately well what the sons of other gentlemen were taught in such places," and which was sufficient to enable him to enter Sidney-Sussex College, Cambridge, as a fellow commoner in 1616. Many of the inhabitants would prefer a statue as a memorial of their famous townsman. In such a case it is always well to ask what would the man approve to whom the memorial is to be raised? Cromwell, it must be owned, did not afford much employment to portrait-painters or sculptors. When after the victory at Dunbar Symonds, the official medallist, was sent to Edinburgh to sketch the features of the Lord General for a medal, Cromwell begged that instead of his own "thundery countenance" the Parliament would be shown on one side and the army on the other. He added, "I may truly say it will be very thankfully acknowledged by me if you will spare the having my effigies in it." Cromwell would, therefore, be likely to have begged his townsmen to spare him the infliction of such a statue as is now too common in England. On the other hand, let anybody read what he says about the conversion of houses in Durham into a college or school of literature, and his expectation of "such happy and glorious fruits as are scarce thought on or foreseen," and it must be concluded that his desire would be to have his old school brought up to the most advanced standard of our times.

The triangular bridge of Croyland suffered on Monday, when a part of the masonry fell in consequence of the collision of a brewer's dray. Arrangements should be made to prevent a repetition of similar accidents. A bridge existed at the spot in the tenth century, but it is considered that the present structure is not older than the fourteenth century. There are three streams, the Welland, Nyne and Catwater or Catchwater. The bridge consequently consists of three pointed arches for the three watercourses, as well as three roadways. In plan the structure resembles an equilateral triangle. The abutments are unusually high but were rendered necessary by the force of the floods which occasionally arise. Each arch is formed of three ribs, and the nine are made to meet at the centre. The inclination of the roadway is very steep and is enough to arrest the speed of an ordinary runaway horse, but it evidently failed on Monday. Perhaps the flight was under the bridge and not over it. The bridge is not adapted to be taken as a model, but from its age and peculiarity it cannot be too carefully preserved. It is, moreover, a supplement to the neighbouring abbey and displays similar skill in meeting constructive difficulties.

If we judge from an address delivered at the annual meeting of the Ontario Association of Architects, some of the municipal officers who are charged with the superintendence of buildings are not entirely qualified for the examination of plans, and apparently it is only good luck which keeps down the number of accidents. At the inquest upon the victims who were killed by the collapse of the floor in the London City Hall the jury declared that extraordinary care was taken in the construction of the beam that failed, although it was unable to sustain a load of about ten pounds per square foot. In one of the Canadian cities an architect was asked to report upon the strength of some of the Corporation buildings, and, according to the President of the Association, an alderman who was not present when the appointment was made is reported to have spoken very violently in opposition to the architect's employment, charging the council with reckless and unnecessary expense, one of his reported sentences being, "Me and Jimmy Jones, a knowin' the strength of timbers, could ha' done it without costin' nothin'" ("Jimmy Jones" standing for the corporation superintendent of buildings). The President considers that it is almost impossible to have adequate municipal supervision anywhere in Canada.

Auxerre (continued)—St. Florentin.

XIII.

BY this time I begin to feel, with the poet's bird, "the keen demands of appetite;" so leave the cathedral, intending to turn to that happy hunting-ground later on. For I have but alf exhausted its mine of architectural interest, some fresh detail some new point of view interposing to claim the attention at very turn. On my way to get some food I pass through the arket, now in full swing, and held partly outside, but chiefly side, a large covered building. Articles of crockery, hard- are, and wearing apparel are displayed externally to the dmiring gaze of the portly Burgundian dames, to whom outs an Autolycus, "Voilà vos bas! Voilà vos fils! Voilà os aiguilles! Achetez! Mesdames, achetez!" And a peculiar nd of cake, looking for all the world like a piece of petrified onge, is being carried about in the crowd. Inside the market, e babel of voices and the scene altogether baffles description. o say nothing of the fish, luscious fruits, and esculent roots, ere is the live stock—geese, fowls, turkeys, and ducks,

South-west View of St. Etienne at Auxerre.

itting calmly in rows, their feet tied together, and presenting he most pleasant expression of countenance under what must e to them rather uncomfortable and trying circumstances. I dmire a fine white rabbit. "Would I buy him?" "No!" was on a tour in France among its cathedrals, and the resence of a rabbit would be hazardous, not to say impossible. Besides, I lived in England, and should have to go back there y the *bateau à vapeur*. Suppose, then, M. le Lapin should have he *mal de mer*? "Ah!" cries the old woman, "et alors quel hagrin!" In chat similar to this, and a turn round all the talls, admiring this, that, and the other, a quarter of an hour oon passes.

Having fortified the inner man, I proceed to visit the hurches of Auxerre, which although not so numerous as those of ens, are on a grander scale and more architecturally valuable. t. Eusebius is just behind the hotel where I am staying. Externally its most interesting feature is the octagonal tower nd spire in Transition between Romanesque and Pointed, and which in early simplicity and beauty rivals the more widely known twelfth century ones of Chartres and Vendôme. The effect of this steeple is ruined by a hideous great chancel which some architect of the Renaissance has raised "cheek by jowl" with it. Those who know Ormskirk in Lancashire and its peculiar western double steeples will have some idea of the picture presented by this spire at St. Eusebius, Auxerre. The Renaissance architect, whoever he was, has entirely remodelled the choir, and very poor feeble work it is. Happily, he has left the Transition nave with its lean-to aisles and low clerestory of simple lancets untouched, the north aisle, however, is tolerable Flamboyant. The western façade is quite First Pointed, presenting three plain lancets above a very refined doorway, richly moulded, and with slender shafts bearing foliaged caps. The red-tiled roofs contribute much to the picturesqueness of St. Eusebius externally viewed from the broad Place in which it stands. Passing to the interior, I find a graceful Transitional nave arcade, on half-columns, some of which have their capitals carved, but varying in design. A triforium, clerestory, and vaulted roof give quite a minster-like appearance to this church, making it appear much larger than it really is. The bosses of the roof at the meeting of the groins are tastefully relieved with colour and gilding. Under the tower, which, as I have stated, stands just to the north of the chancel, are very plain bold arches. The lantern-like choir of the Renaissance period, although very coarse in

St. Germain's, Auxerre: Apse and North Transept.

detail, is undeniably imposing internally, and some of its windows have old glass. The eastern chapel is a miserable imitation of the lady-chapel in the cathedral, and opens out of the circumambient aisle by a triple arcade on ugly attenuated columns, some old glass masking in a degree the badness of the work. The view of the nave from behind the high altar strikes me as particularly fine, its massive vaulting contrasting strangely with the inferior work in the choir.

A steeple of similar character to St. Eusebius is found at St. Germain's. Designed with an entasis, this spire stands quite isolated, the old First Pointed structure of which it formed part having given place to the present church, a miniature cathedral in Early Middle Pointed, consisting of a lady-chapel, choir, transepts, and nave of only four bays, the rest having been destroyed by the Huguenots. Its great height gives St. Germain's a most imposing air viewed from the river, and were the three or four demolished western bays of the nave extant the internal effect would be materially enhanced.

Entering by the door in the west wall, a wretched affair in that dry, quasi-Gothic school of carpentry which flourished during the early part of the century, the aspect presented by the interior of St. Germain's is most dignified and interesting. Just inside the door is a railed gallery, from which, on either side, two flights of steps lead down into the body of the church which is built upon the declivity of a hill. Unhappily, the extreme whiteness of the stone robs this, and many another French church, of that picturesqueness obtainable by natural polychromy. Beside such churches of our English Midland shires as Worcester Cathedral, St. Mary's and the Abbey Church of Shrewsbury, the Northamptonshire churches of Higham Ferrers, Irthlingboro' and Raunds, built of rich, warm, local stones, the majority of French ecclesiastical interiors are cold, relying much, of course, upon mural and vitreous colourisation. The finest points in the interior of St. Germain's at Auxerre are the light graceful arcades whose arches die into the piers without any capitals, the massive groined roof, and the fenestration of the great transepts; that of the northern one is particularly fine, and has a richly-traceried rose.

A flight of steps, similar in elevation to those at the west end, admits to either choir aisle from the transepts; from the north transept a door under this flight leads to the crypt, the only portion of the original structure remaining. Of considerable extent, and with its well preserved paintings on pillars, walls, and roof, it suggests the old Roman catacombs. The part immediately under the high altar in the choir is truly awful. It is quite as much as one can do to stand upright in its little outer aisles, which are separated from the central domed portion by square-headed arcades on pillars with Corinthianising capitals. Here stands the altar of St. Germain, with the figure of that saint over it, enshrined in flowers and evergreens, from which a silver crucifix gleams through the darkness, with very weird effect. Emerging from this solemn crypt to the lightsome superstructure, I notice that the high altar is placed just under the eastern arch of the crossing, the stalls being arranged in the choir and apse basilican fashion. A lofty iron gate, of last century's workmanship, surmounted by a crucifix, screens the chorus from the nave, now serving as the chapel of the Hôtel Dieu. Against the western wall of the south transept is reared a wooden crucifix of imposing dimensions, and bearing on its base the words "O Crux Ave. Mission 1824." A large number of pictures and some well-executed "Stations of the Cross" relieve the general air of coldness which pervades the interior of St. Germain's, whose ensemble recalls the well-known church in the castle of Mont St. Michel.

St. Pierre, the third church, is one of those extraordinary buildings met with so frequently on the Continent. A curious combination of Gothic and Italian, there is something very grandiose about this St. Pierre, Auxerre. It stands some little way back from the hilly street leading up from the bridge, and its western façade looks most grand and imposing on entering the secluded precincts from beneath a Renaissance gateway, which, although much mutilated, is invested with that lovely colouring which time alone imparts. On the south side of the nave, about midway, stands the tower, a good one of the late Flamboyant age, without any traces of Palladian influence, and dating from the fifteenth century. The body of the church belongs to the latter part of the seventeenth century, and consists of a nave and chancel under a continuous roof, aisled and clerestoried. Its regularity renders the interior of St. Pierre at Auxerre so imposing. There is an arcade of round columns and arches carried right round the apse in a grand sweep, and designed probably in imitation of Transition work, since the pier capitals Corinthianise. There is no triforium, a blank space, doubtless intended by its designer for pictorial enrichment, intervening between the arches and the clerestory, whose large three-light windows have coarse tracery in imitation of Flamboyant. A groined roof covers the whole church, so excellent in its workmanship that it is difficult to believe that it belongs to the seventeenth century. There is a good deal of painted glass in the choir clerestory, rich, but with all the faults of a degenerated epoch.

My ecclesiological researches in a measure concluded, a walk along the tree-shaded boulevard by the river brings me back to the cathedral, where I sit until the Angelus from the great tower sounds over the city, and apprises me of the hour of noon. Crossing the market, I find a change in its aspect. Business i practically over, and the "Dames de la Halle" have, t use Sir Walter Scott's favourite expression, "broken th neck of the day's work." Déjeuner is in progress, the demo lition of various savoury viands occupying the undivide attention of such of the company as remain, and effectuall precluding any further display of eloquence.

The sun is now glaring down upon Auxerre through cloudless blue sky, so I am glad to have got through my morn ing's work between those pleasantest hours of the day in continental town, *i.e.* six and twelve o'clock. Déjeune concluded, I spend the afternoon in reading, writing an dozing; then comes tea—looking, by the way, when poure out, something like an infusion of brown paper, as I have fo gotten to tell them to make it *à l'Anglaise*, but refreshin nevertheless. A delightful saunter about the city in the coo of the evening ensues; along the boulevards; by the river; an about the quiet streets in the immediate vicinity of the cathedra whose deep-toned bell presently announces the *Ave Maria* A sister of charity throws aside the jalousies of a window in house near the south transept after the heat of the day, and few devotees are wending their way towards St. Etienne, whos "peaceful gates to all expand," to await in some quiet chap their turn for confession in preparation for the next day's Mas Referring to the "Tables des Offices pour la Semaine" I se that the "Stations of the Cross" are to be sung in the cathedra this evening at half-past seven. As the time approaches, once more repair thither. With the last rays of the setting su steeping the eastern walls of the transepts in richest colou from the painted windows, the interior of Auxerre Cathedra looks most impressive. As I enter by the portal in the nort transept a small procession, consisting of crucifer and tape bearers, clerks and officiant, issues from the sacristy in th north choir aisle, crosses the transept, and is joined on its wa to the First Station at the east end of the north nave aisle b the congregation, consisting entirely of women, among who are several sisters of charity and girls in their charge. It very solemn to see the great processional crucifix borne dow the dusky aisle of Auxerre between the two candles. Sti more so is the first verse of the "Stabat Mater dolorosa," whic presently breaks upon the ear, sung to the familiar tune, u accompanied—the third one to which this world-renowne sequence is set in our "Hymns Ancient and Modern A short exhortation follows each verse; then comes a lo murmuring from the thronging women, anon a pause for sile prayer, and a move towards the next Station while verse No. is sung—

Cujus animam gementem,
Contristatam et dolentem,
Pertransivit gladius,

and so on to the end.

During the singing of the last verse, the high altar is light up for "Benediction"; the congregation take their seats und the crux, the little procession enters the choir through t eighteenth-century crucifix-surmounted gate, the officia assumes a white cope, the glorious old hymns "O Salutar Hostia" and "Tantum ergo" are sung to the accompanime of a trombone, the successor of the "serpent,"* the great bell the cathedral tolls, incense rises in clouds before the o painted glass in the apse which the "shadows of departi day" are rendering less and less distinct, the Host is upraise before the kneeling congregation bent in silent adoration, ar this shortest but most beautiful of Roman Catholic offices enc Lingeringly we all disperse, and the vast cathedral is left on more, silent and deserted.

Saturday, August 6—the Feast of the Transfiguration breaks gloriously over Auxerre. Masses are being said in S Etienne and the other churches in quick succession by prie in white chasubles, music alone being required to give ad tional solemnity to the day on which this wonderful event

* The musical instrument called the serpent is now all but obsol in the French cathedrals. It was invented by a canon of Auxerre, c Edmé Guillaume, in 1590. The "Serpent d'Eglise" is, howev still a functionary in Gallican churches, and I remember when Amiens a few years ago buying the *Semaine Religieuse*, a lit "monthly" corresponding to our parish magazines, in which w recorded the death of the "serpentist" of the cathedral at an advanc age.

nmemorated. Only a few more hours are allotted to me in s enchanting old city, so I make the most of them, paying other visit to St. Germain's, with its fascinatingly awful crypt; St. Eusebius, where I meet a priest coming out, accom- nied by a gardener trundling a wheelbarrow, presumably flowers; thence to St. Pierre, and so back to an early *euner à la fourchette* prior to departure. To decide whether nday shall be spent at Vézelay, with its extraordinary manesque and Early Pointed abbey, illustrations of ich in the shop windows at Auxerre are distractingly npting, or at Troyes, with its five-aisled cathedral and galaxy churches, is a matter of great difficulty, but the latter gains day.

Effects are packed; the omnibus is at the door. Madame d the whole establishment are there to witness its departure d to say "Bon voyage." The driver cracks his whip, and vehicle is driven at a furious pace down the steep, tortuous eets, imperilling the life of a tame jackdaw, and across bridge to the station. Seated in the railway carriage, I e note of those who are to be my *compagnons de voyage* as as La Roche. They include two ladies of uncertain age, on whose remarks, one would think from their gestures, the e of nations depended; a soldier in a state of demi-toilette, o, when the train has left Auxerre, proceeds to invest him- f in his epaulettes, his belt and his gaiters, all of which icles he extracts from the depths of his coat pocket; and a ntleman in broad-cloth and hard felt hat, accompanied by a ild evidently in need of a little wholesome correction on the

Rood-loft in the Church of St. Florentin.

lac Stinger system. An official comes to demand our tickets. etween this functionary and the gentleman in "shoddy" an tercation ensues relative to a flimsy piece of paper—a *permit*, suppose, or something of that kind—and, according to rench custom, everybody in the carriage begins to talk at nce, offering his or her opinion on this precious document. he dispute terminating, as far as I am able to judge, in favour the passenger, the collector slams the carriage door, making se of several very naughty adjectives, the train glides out of e station, and Auxerre and its churches fade like a beautiful sion, to be conjured up during the foggy days of a London ovember.

In due course we arrive at La Roche Junction, where, a short elay occurring before a train can be got on to St. Florentin, is pleasant to sit by the canal just outside the station and atch the great blue dragon-flies skimming over the water.

Once more I am in motion and soon St. Florentin comes into view, my Alsatian driver of the preceding Wednesday being there with his vehicle, and greeting me on emerging from the station with the politest of bows.

There is leisure, until the departure of the train from a station in another part of St. Florentin for Troyes, to visit its grandly situated church. It is, however, a late and coarse Flamboyant edifice, whose most picturesque external feature is the long flight of steps leading up to the portal of the north transept from the hilly street. A procession with banners and crosses passing up or down this ascent must have an uncommonly picturesque effect. Viewed outside, this church at St. Florentin appears to consist of a lofty apsidal choir and transepts only. On entering, however, a low unfinished nave of but two unclerestored bays is presented to the visitor.

Pecuniary considerations or the religious wars doubtless determined the promoters to discontinue their work beyond this point, for a vault, by no means of temporary character, springs from just above the arcades. A gallery, in Italian Corinthian, carried on three round arches between pilasters, supports one of those imposing-looking organs so frequent in France, and marks the bare, hastily finished west end, whose only relief is a round window, traceried in very tolerable imitation of Early French. Equally meagre is the fenestration of either transept.

The glory of this truncated church at St. Florentin resides, however, in its fittings, conspicuous among them being the rood-loft and the Early Renaissance screens, which not only enclose the choir, but the chapels surrounding it, and which are perhaps only excelled in beauty and extent by those in the glorious First Pointed cathedral of Laon; but any detailed description of these fine works is precluded by the illustration with which I have furnished the present paper.

Besides these interesting instrumenta there is some good stall work, an imposing lettern, the strap-like treatment of whose ironwork has been laid under contribution by two of the most accomplished architects our Gothic revival has produced; a charming little semicircular projection from the eastern side of the jubé containing the steps conducting to the loft, and an imposing reredos of the Corinthian order. All these are very chaste, and agree remarkably well with the late character of the building, but one fails to see the appropriateness of an altar shaped like an Egyptian sarcophagus. The candlesticks and flower-vases are rococo; indeed, it is strange that so many great French churches should retain their high altars of the Louis XV. and Early Empire periods, while those in the side chapels are frequently most sumptuous and correct specimens of Revived Pointed work, with exquisitely jewelled tabernacles, predellæ faced with subjects from Scripture or saintly figures; the altars themselves, unprovided with frontals,* being seen to rest on small pillars, under which reliquaries, some of them elaborate specimens of orfèvrerie, are deposited. Side curtains, too—very picturesque and devotion-aiding adjuncts—are rarely met with in the French churches, and these, together with rich needlework of any description, are desiderata in the majority of Gallican church sanctuaries.

"It is heat and mid-day," and the streets of St. Florentin are deserted when I pass out into them from the church, intent on taking home some souvenirs of so richly furnished an interior in the shape of photographs. Luckily these were forthcoming, though not until after some difficulty, and I am happy to be enabled to "embellish" this paper with a copy of one of them.

(*To be continued.*)

EDINBURGH ARCHITECTURAL SOCIETY.

A MEETING of this Society was held on the 15th inst. in Dowell's Rooms, when Mr. Isaac Connell, S.S.C., gave a lecture on "Legal Points affecting Architects." He dealt fully with the subject, the paper being much appreciated by those present. Some discussion took place, in which the lecturer explained some matters raised by members of the Society.

* I noticed an interesting departure from this apparently established rule in the cathedral of Moulins-sur-Allier. Here every altar is provided with a frontal, thanks to the ecclesiological taste of a bishop who presided over the see fifty years ago—Monseigneur de Dreux Brêzé.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last at Conduit Street, W., Professor Aitchison, R.A., president, in the chair.

The Secretary announced the decease of Mr. James Murray (retired Fellow).

Papers were read by Mr. J. M. Brydon and Mr. F. J. Burgoyne (Central Tate Library, Brixton) on

Public Libraries.

Mr. Brydon explained that his object was to show, with as full illustrations as possible, something of what had been recently done in library building, so that one may learn what to follow in the future.

A suitable site is of primary importance. It should be central and prominent, yet quiet, ample in area to allow for future extension, have a good light all round, and be dry.

As regards the building, the free and open system of the ordinary popular library—*i.e.* reference and loan combined with reading-rooms—rendered proper supervision essential, and as libraries are usually understaffed, the arrangements of the plan must be concentrated so as to enable the officials to supervise at a glance all the rooms to which the public have access. An ideal plan is to place all the public rooms on one floor. Where this cannot be done, the rooms to which most frequent and rapid access is required should be placed on the ground floor, and those less frequented on an upper floor. The administrative portion of the library, such as the book stores, the librarian's office and the workrooms for his staff, must be conveniently placed for the service of the department to which they are more particularly attached. The public rooms should be lofty, well lighted and thoroughly ventilated.

The planning of a public library is not, however, a complicated problem. The requirements are comparatively few and simple, and lend themselves to a stately and architectural system of design from which some striking effects almost necessarily follow. It must be endowed with a fitting dignity both in plan and elevation. The reading-rooms being large give ample scope for the designer's knowledge of proportion. They should possess that quiet dignity of effect which can only be obtained by good proportion and restraint in design. Fussy little bay windows and other nooks and corners are uncalled for and out of place.

Respecting the lending department, the author considered that an architectural opportunity had been missed in many recent English libraries. Instead of being simply a book store, with a space cut off for the public, the latter might be treated as a hall or lobby by itself, as in some of the American libraries, notably at Boston. There the delivery room is 64 feet long by 33 feet wide and 20 feet high, and is decorated in the most sumptuous manner. Adjoining it is the stack-room, to all parts of which application slips are sent through pneumatic tubes. The books come back to the alcove by means of a little electric railway with low wire basket carriages, running at the rate of 500 feet per minute. The delivery-room at the Edinburgh Public Library is modelled on the telling-room of a Scotch bank. The central space is devoted to the public, with counters round three sides and alcoves behind them, for the storage of books. This arrangement gives scope for, and is treated with considerable architectural effect, a handsome hall being the result. The public library of the future will be the centre of culture and enlightenment of the district in which it is placed, and will wield an influence which must ever become wider and stronger. The building should be of such a character as to assist this influence. The suburban villa type, with its useless turrets and bay windows, should be altogether discarded—in short, the building should be endowed with that distinction of style and nobility of purpose which will render it an enjoyment and inspiration to all who hope for the growth of a living interest in architecture as a fine art.

Having briefly referred to the arrangement of rooms in libraries recently erected in the United Kingdom, plans of all of which were shown, the author turned to the great American libraries, describing in more or less detail the buildings, plan, and more notable features of the Congressional Library at Washington, of which an interesting historical sketch was given, the public library at Boston, the Columbia University Library, New York, and the public library about to be erected in New York.

In the Washington Library the American Government had commissioned American sculptors and painters—some fifty in all—to decorate broadly and thoroughly one of its great national monuments. The result was the most interesting record possible of the scope and capabilities of American art; not only sumptuousness of design, but richness of materials had been pressed into the service—marble, bronze, mosaic, fresco and choice woods all bear their part. Staircase hall and rotunda, or reading-room, are a blaze of rich marbles and decoration. In the rotunda the columns and pilasters of the piers carrying the dome are of red Numidian marble resting on pedestals of dark purple Tennessee marble, their capitals bein gilded. The screens between the piers are of yellow marble and the portrait statues which surmount the balustrade are c bronze. The building is 468 feet long from north to south 340 feet deep from east to west, by 72 feet high. The rotund is 100 feet diameter, 125 feet high to the top of the dome, and 160 feet to the domed ceiling of the lantern. The architect were first Mr. Smithmeyer, then General Casey, Mr. Bernar Green and Mr. Pelz. The building cost 1,272,000*l.* sterling.

The great architectural features of the Boston Library ar the staircase hall and the Bates Hall—the former notable fo its mural paintings by M. Puvis de Chavannes, illustratin philosophy, astronomy, history, chemistry, physics, pastora dramatic and epic poetry. Bates Hall is the reference reading room; it is 218 feet by 42 feet, and 50 feet high to the crown o its arched ceiling. It has accommodation for 264 readers a 33 tables. Sargent Hall, named after the eminent painter, i 84 feet long, 23 feet wide and 26 feet high. The ceiling i vaulted, and the hall is lighted from the roof. The decorativ painting will be entirely by Mr. Sargent. The scheme, repre senting the triumph of religion, illustrates certain stages o Jewish and Christian history. Some of the work was shown a the Royal Academy in 1894. The interior court, anothe charming feature, is surrounded on three sides by an ope arcade of white marble, similar in design to that of the Car cellaria Palace in Rome. In its centre is a marble fountain, se about with grass plots; along the walls under the arcade ar low oak benches, so that on warm days the court may be use as an open-air reading-room. The building is a careful stud of modern Renaissance, thoughtfully and lovingly carried ou reflecting the greatest credit on its architect, Mr. McKim, an the public spirit that called it into being. Many interestin facts and figures in connection with this library and the branc libraries at Boston were given by the author.

The third library called attention to, that of the Universit of Columbia, New York, was built and presented to th University by Mr. Seth Low, president of the University, as memorial to his father. Construction and equipment hav cost nearly 240,000*l.* In plan it is like a Greek cross, with th great reading-room at the intersection of the arms, and covere by a dome. It has a magnificent approach of great terrace and steps leading up to a noble entrance portico of ten Gree Ionic columns. The entrance-hall is adorned with splendi marble columns. The building, of which many interestin details were given, may be taken as an example of a typica university library worked out on modern lines to suit moder requirements—a utilitarian scheme artistically carried out.

The public library about to be built in New York was th subject of a limited competition last year, and copies of th successful design, lent by the architects, Messrs. Carrère Hastings, were exhibited in the waiting-room. In its mai lines it somewhat resembles the Boston Library, but in th instructions was this distinction, that though the authorities di not object to external splendour, they were rather disposed t favour a simple interior. The winning design had resulted in good plan, and what promised to be a stately, dignified exterio A marked feature is the raising of the building on a gre terrace. The architects were not content with designing th building alone; it must have a dignified setting; so by means broad flights of steps, terraces, fountains and votive column the approaches were made to contribute to and enhance th effect of the architectural picture. This, the author thoug was a point to which more attention should be paid in publ buildings in England.

In conclusion the author expressed the hope that the American works were not without their lessons for us in mo senses than one—not only as libraries, but as public building Would that some of the public spirit and the love of art whi animated the founders and designers of those works could transferred to the hearts of the City Fathers of London a our great provincial towns.

Mr. F. J. Burgoyne opened his paper with some observ tions on the limited income derivable by municipal librari from the rates, urging that the initial charges for buildings a sites should be paid out of the general rates, and the whc proceeds of the penny rate be available for the current work the library. The plan of the building should be considered n only in relation to the public but also to the probable size the staff to be engaged. Dividing municipal libraries in three kinds—small, medium and large—the author indicat the minimum accommodation that should be provided for sta books and public, illustrating his points by reference to pla of existing buildings, a large number of which were shown the lantern. For a small library the plan generally adopted a rectangular room, lit chiefly from the top, with newspape stands and tables in the centre; the walls on one, two, or thr sides shelved for books 15 to 18 feet in height, and a count or rail running round the room 6 or 8 feet distant from t books. Libraries of medium size require a quiet room whe books of reference may be consulted. Such a room may combined with one for reading the higher class magazines a

vs. If the public rooms are all on one floor the refer-
books will be shelved alongside those of the lending
tment. If on two floors the reference department
ed upstairs, and the lending and general newsroom on
round-floor. In the larger libraries, the work done in the
nce department is of the most valuable character, and it
visable to have, in addition to the ordinary reference
g-room, a smaller room for the use of students of special
ts, or those who are engaged upon original research.
ibrarian should have a room for his own use—one that
e used, if necessary, for the meetings of his committee.
ge libraries there should be a fireproof strong-room, on
me floor as the reference department, in which the rarer
and MSS. can be stored, and rooms for repairing and
g books. There should be mess-rooms for the staff and
le lavatory arrangements.
e author recommended that before planning a building a
idea of the method of work to be employed should be
ed from the librarian. The various methods of issue—
ndicator, without indicator and "open access"—require
ent accommodation and different arrangements, all duly
ibed by the author.
shelving the books in the lending department, it is im-
nt to place them as near the issue desk as possible, in
to facilitate quickness of issue. Reference books, the
r considered, were best shelved in a store-room adjacent
e reference reading-room. Room must be allowed for
h in this department. It was estimated that in the larger
ies stock would increase threefold in twenty-one years.
ope with such an accretion the author favoured the
ion of the American "stack system" of packing the books,
ined with rolling bookcases for works in least demand.
system was described by the author, and plans and
ns were shown of the stack system in the libraries at
wald, Halle and Strasburg.
e new system of sliding presses in use at the British
um consists of stacks three tiers in height and about 9 feet
In front of each bookcase a couple of steel girders with
s are bolted to the iron floor above, at a distance of about
ches from each other and at right angles to the case.
these girders hang a bookcase of the same width to
a few inches of the floor. It can be filled with books, and
dily pulled away from its normal position close against
ont of the fixed bookcase. It can be adopted piecemeal as
ecessity arises for greater accommodation in any particular
n of the library. A somewhat similar system is in use in
rary of the India Office. The iron bookcases hang from
rs, as at the British Museum, but are packed close
ner, and if a book is wanted the case containing it is pulled
to the central gangway, which is the same width as the
g case. This is the closest method of shelving yet
ed, and very useful for books not much in use. All
es should be of the same length—36 inches is the most
nient length. No bookcase should be higher than 8 feet,
is preferable.
r. F. Pacy, hon. secretary of the Library Association, said
ians must congratulate themselves if, as a result of such
s as they had heard, the architectural profession would
st themselves more in the necessary details essential for
d library. For such a building, all the departments to be
e ground floor was of course preferable. The treasures,
f the library should be exposed in cases round the walls,
ese treasures were the best furniture such a place could
. Neither of the papers had touched upon the warming
e building. Radiators around the walls were not good;
eating apparatus should find a place in the centre of the
s. The ventilation was an important question, and
ugh proper provision should be shown for the benefit of
rs, yet care should be taken that the officers and staff of
ibrary should work in a pure, fresh air. It was a remark-
thing, the speaker said, that a country like our own, with
a literature as ours, should be so far behind the Americans,
e literature was not so old, in providing proper accommo-
n for its national treasures.
[r J. H. Quin (Public Library, Chelsea) pointed out that
parish or town did not build a library every year, allowance
rowth ought to be considered in the original plans of such
ilding. The site, where possible, should admit of future
sion.
[r. H. H. Statham, who proposed a vote of thanks to the
rs of the papers, said Mr. Brydon had mentioned a library
ich the windows were closed and airtight, the ventilation
obtained by means of apparatus. These precautions had
taken to prevent the entrance of dirt and dust, which
l spoil the contents. If the ventilation was carried on by
s of pipes, it was just as easy for the dirt and dust to enter
om through the pipes as through the windows.
[r. Beresford Pite seconded the vote.
he authors briefly replied.
he meeting then terminated.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.

THE usual monthly meeting of this Society was held on the 14th inst. at the School of Art, when there were present Messrs. R. W. Fowler (in the chair), F. Fowler, C. J. Innocent, E. M. Gibbs, C. Hadfield, C. B. Flockton, J. B. Mitchell-Withers, C. Gibson, Thos. Winder, W. C. Fenton, (hon. sec.), T. Myles, C. F. Innocent, and many others. Mr. P. Marshall gave an interesting and instructive lecture on "Surveying." The lecturer prefaced his remarks by giving advice to the students upon the necessity of being careful and particular in all the work appertaining to the profession of a surveyor. He then proceeded with a detailed description of the work done by surveyors of 150 to 200 years ago, and the character and beautiful workmanship of the finished plans of that period, and illustrated the manner in which the surveys were carried out from that period to the beginning of the present century, and explained how the plans were prepared by these early surveyors and the various details connected therewith, contrasting the amount of labour expended upon the finished plans of that period with those prepared in these hurried times. After referring to the work done by the surveyors in the enclosures of the commons and waste lands of England, he gave a detailed description as to how the surveys of these commons were made, the manner of laying out the roads and dealing with the rights of way across the same, also the way in which the surveyors valued the commons for dealing with the commoners' rights, and also the allotting and setting out the plots apportioned to them. He also gave an outline of the work done by the Commissioners and the hearing of claims, and as to what these claims consisted of, being for various rights, such as those of pasture, horses and sheep, the rights in respect of ancient enclosures, the tithe owner and the lord of the manor and his manorial rights, and explained how the lands were allotted in lieu of those rights. The different methods adopted in meeting the expenditure incurred by the Commissioners in their work were then shown. He described the various systems of modern surveying, and their application to the surveys of country estates and property in towns, and specially explained the applicability of traversing with the theodolite for these surveys, with advice as to how the same should be carried out. Proceeding, he laid down what in his opinion was the best mode of preparing Parliamentary plans for engineering and other uses, and in particular the making of the surveys required for the working plans for railways and other works. He next gave advice as to preparing the cartoons for Parliamentary and other purposes, which are used in the illustration of works before committees of the Houses of Parliament and other tribunals, concluding his paper with a brief description of how the ordnance survey of England was carried out, and the details shown on the published maps.

On the motion of Mr. Fred Fowler, seconded by Mr. C. Hadfield and supported by Mr. H. Vickers, a hearty vote of thanks was given to the lecturer.

SOCIETY OF ANTIQUARIES OF SCOTLAND.

THE usual monthly meeting of this Society was held on the 13th inst. at the National Museum of Antiquities, Queen Street, the Hon. John Abercromby in the chair. In the first paper Mr. Thomas Ross, architect, F.S.A.Scot., gave an interesting notice of James Gifford, a local sculptor, who practised his calling at West Linton in the latter half of the seventeenth century. Several of his works still remain in the village, and a number are in the possession of Sir James Ranken-Fergusson, Bart., at his mansion-house of Spitalhaugh. One of his most interesting productions contains a group of his ancestors, with himself and his son. His ancestors were the Giffords of Sheriffhall, who were tenants or vassals of Newbattle Abbey at the time of the Reformation, and had been so for generations previously. One of the figures shown on this piece of sculpture is probably the James Gifford who was charged before the Privy Council with being an accessory in the slaughter of Rizzio at Holyrood in 1566. Most of the sculpture is in low relief, and the groups generally consist of two figures in profile facing each other, with accessories consisting of conventional trees, roses, thistles, birds, &c. The rich dresses of the figures give the sculptured panels a highly decorative effect. He also erected a cross or well to the memory of his wife, Eupham Veitch, and of his children. It stood till a few years ago, adorned with their statues, when, unfortunately, it was taken down and a most tasteless Jubilee erection put up in its place, but preserving the statue of Eupham Veitch; while that of one of the children is preserved among the Spitalhaugh remains. Gifford took part with the Covenanters, and was at the affair of Rullion Green, from which he escaped scot free. He had, however, to go into hiding, and his name remains carved (it is supposed at this

time) in very weather-worn letters at a remarkable rock called Harbour Craig, near Newhall. Gifford is frequently mentioned in the poems of Alexander Penicuik, a contemporary, who was proprietor of Newhall. Several gravestones by Gifford are believed to exist in various churchyards in the district. The paper was illustrated by drawings of the principal works of Gifford still remaining in Tweeddale. In the second paper, Mr. F. C. Eeles gave a notice of a portion of a sculptured slab bearing a Celtic cross recently found in the churchyard of Kinneff, and now presented to the Museum. Kinneff Church, famous as the place of concealment of the Regalia of Scotland in the seventeenth century, is one of the oldest foundations on the east coast of Scotland, although its early history is very obscure. The original dedication appears to have been to St. Adamnan. The fragment of this sculptured slab was found among stones taken from the north wall of the church, and bears on one face a cross of the usual Celtic form with semi-circular hollows at the intersections, and having a small boss in the centre, with corresponding bosses on the arms and summit. There are also traces of an interlaced pattern of the strands on one of the arms. Comparing the cross with that sculptured on St. Wolde's Stone at Logie Coldstone, which it most nearly resembles, the author came to the conclusion that it must be assigned to a rather late date in the second Celtic period. In the third paper Mr. Angus Grant, Drumnadrochit, described a curious stone cup, with a footstalk, the whole exterior of which was boldly carved with leafage, which was ploughed up about twenty years ago on the farm of Balmacaan, Glenurquhart. The cup, which was exhibited, is made of the fine red sandstone of the district, and is 4 inches high by 4 inches across the bowl. In the fourth paper, the Rev. George Wilson contributed a list of the antiquities of Glenluce, Wigtownshire, with plans and descriptive notes, from materials accumulated during many years, but chiefly between 1868 and 1882, enumerating them under the heads of old castles or manor houses, ecclesiastical remains or sites, including sculptured stones or holy wells, mote hills, forts, hut circles, lake dwellings, standing stones and cairns. Of the latter, which are still very numerous, many have been totally dilapidated since the erection of dry stone fences came into vogue, and it is significant that the districts longest under improved cultivation are most thoroughly stripped of their antiquities—hence the necessity for a detailed list of such as have been suffered to remain. In the last paper the Rev. R. S. Mylne gave an account of the King's Master Gunners of Scotland, with the writs of their appointments from 1512 to 1703.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last at 9 Conduit Street, W., Mr. G. H. Fellowes Prynne, president, in the chair.

A hearty vote of thanks was given to Mr. H. L. Florence for conducting members on the occasion of the first spring visit over the Carlton Hotel, Haymarket, on February 4, and for the hospitality shown them.

The President announced that on March 8 a series of lectures on "Coloured Decoration" by Mr. Alfred Hart would commence. The fee for the course of lectures, which started at 6.30 P.M., was 10*s.* 6*d.*

Mr. Cole A. Adams read the following paper on

Colour Decoration.

The subject of colour decoration is a vast one, and the time in which to consider it this evening very little, but even that little may seem long, according to how the lecturer treats his subject. And how to treat it? "That is the question." So much has been written and said about it during the last, say, five-and-twenty years, until I fear there is almost a likelihood of a deaf ear being turned to the preacher. After careful consideration I came to the conclusion that I would head my remarks, "A Chat about Colour Decoration," and I will endeavour to say something which may haply be of some practical use to my fellow students, for whom I have every sympathy, and the happiest recollections of the years wherein some of us have studied colour decoration together. My discourse is addressed to students, and I shall attempt no dissertation upon the higher flights that have to be ascended in treating so voluminous a subject. I propose to speak of some of the various methods adopted in colour decoration, and to offer a few suggestions which may be of use in your study of the subject.

In our cities and manufacturing towns the architect, in attempting to add the charm of colour to his building, has to encounter the smoke demon, who no sooner than the building is finished sets to work to deface it as far as he is able. At present—and I fear so long as he is permitted to work his wicked will—no remedy is possible. Perhaps in the future, when we shall see more use made of electricity, or some means are found to compel manufacturers effectually to consum h own smoke, and householders also, then, when this dem n chained, we may see our buildings decorated with colo o more cheerful tone than they now possess.

The trials which have been made of glazed earthenv majolica for both outside and inside architectural treatm hardly, I think, quite satisfactory. It is an excellent m where cleanliness is a sanitary necessity, but the glazed is fatal to that repose that colour when applied to a b seems to demand. It gives a restless appearance which turbing to the harmony of colour, and even this mate enemy, the smoke fiend, does not respect. But then y wash it, say its advocates. So you doubtless can, but find in practice it is done? The light falling on the mo ornaments is a disturbing element and distorts the gives a better appearance and is more decorative material presents a smooth, non-reflecting surface, and h a dull glaze. You do not varnish decoration which yo in oil-colour, for the reason that you would lose that qu flatness and repose which are so important. Detached executed in a glazed earthenware are properly so treated when it is applied in large surfaces it becomes distr These remarks apply, but in a lesser degree, to polished which, unless introduced with great discrimination, is satisfactory when covering large surfaces.

Mosaic should, I think, be always employed on a c or convex surface, and is hardly ever pleasing on a flat hence its unsuitability in reredoses, as generally applied.

And here I am tempted to ask how long the custod our cathedrals and churches and the worshippers in the be content with the sculpture and painting that is ge thought good enough? There are not wanting instance one sees work which it is a pleasure to find, but such in are rare. Buildings erected by our best architects cont often sculpture and painting executed by incompete nameless artists. Sedding saw this need for calling on plished artists to help him in his work, and all true arti would wish it, instead of having to be content with th lifeless, mechanical productions of advertising firm generally sees. When we go abroad we are shown masterpiece of the sculptor or painter's art done at a tim the highest efforts were alone thought worthy of a place sanctuary; and yet at the present time men are riche they ever were, and could the better afford to give. monuments to the dead in our cathedrals and churcls frequently works of worth and beauty, but we want u good work dedicated to the service of the living C worship.

Mention must in fairness be made of the great p made in stained-glass; much of it is admirable. Pe will not be long before the educated and wealthy will the aid of artists who will give us work that shall be w the building they are placed in and worthy of the arti executed them. There can be no better medium of pe ing their fame.

In a house in the North where it has been my priv stay many times, built for the most part by a man who from an artistic race and who himself is artistic in ever is a mode of decoration which, as far as I know, is and certainly most delightful. The decoration I wish larly to call your attention to in this house I will endea describe, and I am indebted to the owner for this des He was present and saw how the work was done, and t who executed it was a Scotchman—by name Cottier—a great genius, better known in the North and America th in London.

The walls and ceilings were prepared in the usu They were then covered with a thick coat of oil and wh made the consistency of pudding, and laid upon the wls ceilings with a trowel. The next process depended up the nature of the design was to be. Supposing it u ceiling to be treated as a vine trailing over the whole the artist with his thumb boldly draws the leading line of design, and then with the end of an ordinary paint-brus the stalk, leaves and fruit. Those parts which he whe emphasise are modelled in the material—such as the which are raised in relief; in fact, with the coating wic has been careful not to lay on to a uniform thickness h to produce effects, whilst moist, as his fancy dictates wants a more or less geometrical pattern on the walls, a comb and by eye draws in patterns such as you may on the outside plaster of old cottages in Suffolk and el and also similar to some Japanese patterns with which all familiar. Again, on the surface thus prepared he powdering here and there of small patterns. This coa is capable of taking any kind of design the artist may his fancy dictate, is allowed to dry and harden. It painted the general colour it is to be, and the artist has mixings at hand of the same colour, and blends the goes. Those parts of the design to be gilded are so d the various colours applied and allowed to dry. Fin

; dull-varnished and has bronze powder mixed with the
, which gives a kind of sheen to the whole. The bright
gold are toned down and the colours blended one with
er. This, as far as I could gather, is the process. It is
anything with which I am acquainted, and it has great
lities. It gives somewhat the charm that a picture
which the colour is laid on unsparingly with brush and
knife. The burred edges of the patterns, flowers or
ised in the process reflect light. The colours running
o the other satisfy the eye by their variety, and the dull
d effects, mingling again with the bronzes, give a rich-
nd *tout ensemble* which is charming. This work, how-
must be done by artists. Executed by the ordinary
tors it would be intolerable.

e striking effect in this house was suggested by the
. He saw a ceiling after it had been floated with the oil
hite lead with the trowel marks left. With a happy
tion he told the man to leave it so, and paint it with a
opper bronze. The result is a most happy one—it has
ne charm that beaten copper produces.

speaking of this decoration—which I am afraid conveys
eeble impression to your minds—I must tell you that the
are for the most part fine and lofty, the floors of parquet,
e house full of the most delightful old woodwork and
re gathered from many cities at home and abroad; the
are hung with pictures, and an air of distinction and
aste is prevalent everywhere, which makes a visit to the
an education in itself.

ere may be some among you with an eye and love for
and ornament who might do much worse than take up
anch of architecture as their calling. With the advan-
you enjoy of learning your profession, it would be a
gain to you, and you would bring to bear a knowledge of
cture and building construction which would be of
use. The want of such acquaintance with this art
ts for the failure one so often sees in modern decoration.
possessed artists with architectural knowledge, who made
calling to decorate buildings, it would be a great public
and the public need educating in matters of taste.
ng up around us are town halls, picture galleries, free
es, swimming baths, &c. Do not these offer scope for
ist? There are hundreds of such buildings lately come
istence waiting the hand of the artist. For a moderate
epending largely, of course, upon the building and the
f decoration, they might be made more attractive and
ting. Now, what happens? The powers that be call in
al painter and decorator; he sets to work and—paints
nowing very little of the principles of decoration, abso-
nothing about architecture, he, of course, cannot apply
coration architecturally, and, as a result, he not only
s the building and the architect who designed it, but
its the further crime of offending against good taste.
for comparatively a few guineas paid to an architect who
such work his specialty, or to a skilled decorative artist,
me local painter and decorator might be led to turn out a
which would at once appeal to educated taste and give
blic decoration of which they might be proud. I believe
norities having the care of such buildings knew where
ould obtain competent advice and skill in carrying out
ass of work, they would avail themselves of it.

ere is abroad everywhere a quickening of interest in
life, and the cities and towns are vying with one
er in providing buildings dedicated to the use of the
, which augurs well; and, as time goes on, we may look
further extension of this good—as good it is—tending to
down class prejudices and bring peer and peasant
er with the happiest results; in good time much may be
to render the lives and homes of the poor happier and
by this process of levelling up. To this end the decora-
rtist may employ his talent and do good by creating
iful work that must have a refining influence for good.
owns there are of any importance that do not tempt our
singers and actors to visit them, few that do not possess
work of an architect of eminence; and it may be that at
tant future few will be said not to possess some work of
a great painter or sculptor in a richly-decorated building.
ot worth working for to become one of them who shall
the fame of the town who employs him by his skill in
decoration, instead of leaving such work to be ignorantly
ulgarly carried out?

perience in practical decoration may be gained in a way
s probably within the reach of most of you. In the parish
ich you reside there will be a school or a parish room,
e parson would doubtless be glad of any one who could
nd to volunteer to decorate it. This would give you the
tunity of doing experimental work which would be excel-
aining, and, at the same time, you will be doing practical
to others. But how to set about it? Parson may not
sonably object to having his building made use of for
iments. You must first qualify yourselves by learning the
craft to convince him you know something about the art.

I think one of the best ways to study decoration is to sit down before the object you are engaged upon and try and grasp the notion or leading idea of the artist; how he has treated it and how worked it out; what leading colour or colours he has chosen; in short, its leading characteristics. This sitting down before the object you wish to study, and, so to speak, inhaling it through the pores will not be lost time. It will, moreover, have the great advantage of training you to the habit of recollecting a scheme of design and colour, so that when you come to transmit your thoughts to paper, you will have helped to train the faculty of seeing your design in your mind's eye. To resume. Having taken in the scheme or design, I think the next best thing is—supposing it to be a ceiling, for instance—to make a plan and sections of it, then select that portion which will illustrate how the design or pattern will repeat. These drawings you should sketch as neatly and with as little detail as will express the thing you are at work upon, then put on a few leading dimensions; note the distance from the eye where the decoration is most effective, the style, probable or approximate date, place, and, in fact, each and everything that occurs to you as worth noting. I have found by experience the utmost use of thus jotting down particulars of what I am sketching, and I am sure it is a good plan, as (may be years after) it recalls the subject and gives you data which may have passed from the memory. Having made these drawings, which may be more or less elaborated according to what you are engaged upon, you may now proceed to detail the work to a larger scale and draw with the greatest care the ornament. A number or letter referring to where the part is should be noted on the plan or section, so that the details may agree with the drawings. When you have got your details sufficiently forward in pencil you may then proceed to colour them, and this will test your eye for colour. If you have not got your colours with you, or are pressed for time, a simple plan is to put on the drawing a schedule of colours and number them thus, red 1, blue 2, yellow 3 and so on; or you may elect to adopt the heraldic method. Either of these ways will be of use in keeping you in mind of the scheme of colour, and then you can at your leisure colour in your drawing; but the study will be of most use which is painted on the spot. And here I would remark that the habit of noting will be of use in describing how particular effects are produced and where the colouring has been influenced by the hand of time. Some decoration which we find now so charming owes that charm to reasons never dreamt of by the artists who did the work. In fact the work of the past owes a great deal to the hand and palette of good old Father Time.

Of course, in sketching at a museum, for instance, the object is generally detached, and can be embraced in one drawing; but here again I would urge upon you the need of cultivating your power of criticism and observation by noting down any memoranda which the subject may call forth. Let nothing appear too trivial. Attention to seeming trifles trains the mind to greater things, for is not the house built of separate bricks? It all depends upon what you are sketching, but where the detail would work out very small and not large enough to explain the design, that part should be drawn to a larger scale. As you proceed you will insensibly learn what best shows and illustrates the subject which you are engaged upon.

As excellent examples of studies I would instance the exhibition of students' drawings for the Owen Jones Prize which was on view here recently.

In studying from nature I would suggest to you that the same method should be adopted. And as correctness, beauty and accuracy of line cannot be learnt better than by study from the living model, the same principle exists in studies made from still life, and no better advice can be given to those studying decoration than to go direct to that source. Every subtlety of line, curve and contour, every gradation of colour and tint, of light and shade, will be found by those who seek it in endless variety, and great is the happiness of the search. Store your sketch-book with such studies. Take, for instance, a spray of any flowering plant and sketch it in outline with the stalk, leaves and flowers, with just enough detail to express it. Note the varieties of form and curve, and how the effect is produced. Then sketch the same spray from another point of view, and if you wish to study it further, from yet another. Then detach one of the flowers and carefully draw it in all its parts, if possible to a full size, the plan, elevation and section. What is the use of all this? is asked. I reply, every use; for the knowledge of parts thus grasped will one day stand you in good stead, and it teaches you the value of patient research, and trains you in the habit of thinking no part of your work too small or insignificant, besides giving you glimpses of the miraculous, and discovering new beauties which you never so much as dreamt of. You must, therefore, train yourself in the habit of close observation, which will in time become a habit. The simplest flowers are the most suitable to study from, and the most useful—the simpler the better. For models of expression in sketching you should study the Japanese. They succeed in that most difficult

art of knowing how much to put into the picture to express its meaning. Time spent in studying these drawings will not be lost. Excellent Japanese books can be procured at Mr. Batsford's, bookseller, Holborn, and very inexpensively. In colouring your studies from nature do not attempt more than giving the local colours and only sufficient to express this. The way the Japanese lay on their colour will best illustrate what I mean; there is no need to spend time in elaborating your studies; you do not want to paint pretty picture-cards. For the mingling and blending of colour you cannot do better than get hold of a piece of polished agate, marble, alabaster or other richly-veined stone; note their qualities of line and colour; these studies will require great attention in the execution, and *en passant* the employment of body colour will be found useful in making them. Then make sketches of birds, beasts, shells and fishes which present features of decoration, and draw the same object from different points over and over again till you have driven it into your brain and learnt something of what they have to teach. Note carefully the lines of decoration and colour and the value of contrast. This is what Tennyson writes:—

> See what a lovely shell,
> Small and pure as a pearl,
> Lying close to my foot,
> Frail, but a work divine,
> Made so fairily well
> With delicate spire and whorl,
> How exquisitely minute,
> A miracle of design.

Butterflies, beetles and gorgeous insects convey a great deal of teaching and train the eye to the beautiful harmonies and daring contrasts to be found everywhere in nature, which brings colours together in contrasts of ever-varying beauty. Any dogmatism upon the harmony of colours, and what colours may or may not be used together, is silenced when one sees how nature employs her palette. In making these studies from nature do not forget the need of written memoranda, descriptive of what you have before you, and figure the dimensions upon the drawing; in short, give as much information as you can find space for. Bear in mind they are studies. You do not need to make pretty drawings to show "your sisters and your cousins and your aunts." Let your studies from nature and from the works of man run side by side.

You will find it useful to acquire the art of sketching in perspective. You can in less space show so much more of your subject, and if you can readily and easily sketch in perspective, it conveys the intention much better to the lay mind. It has besides a commercial value, as you may convince a client the more readily if you can show him how a work will look when executed. At the same time, do not let this kind of sketching take too great a hold upon you to the neglect of careful and figured details drawn either by eye or to scale. Drawing in perspective becomes so fascinating that the temptation is to make a picture, and you will learn your lesson better by a hard matter of fact diagram. In making studies of ornament in monochrome, it is most useful training to do so with a brush. You cannot get anything like the freedom or effect by using pencil or pen, and you will come nearer to the Greek and the Japanese if you copy their painting direct with a brush. With a little practice you will find no great difficulty; besides, it is excellent training, and it will let you into the secret of how they produced their effects and why their ornament takes certain forms. If you wish to study the ornament as practised by the ancient Greeks go to the British Museum, make your way to the vase-rooms, and you will see how, by the employment of simple yet lovely forms, they have produced designs in endless variety and mostly with the use of a single pigment. We frequently hear a great deal about the accuracy displayed by the Greeks in their treatment of ornament. Many of the examples which have come down to us are anything but well drawn, and all that I have studied show an absence of mechanical accuracy, being obviously executed by the eye and hand only.

It is the fashion in employing Greek ornament in decoration of all kinds to do so with geometrical precision, with the result that it is all "faultily faultless, icily regular, splendidly dull." It does not pulsate with life, and to employ Greek ornament thus is to miss half its beauty, which does not consist in perfect accuracy of parts, but in that charm which the trained eye and hand alone can give to all work, and which is lost in mechanical execution.

In the repetition of ornament, where the same pattern is employed over and over again, stencil-plates are generally used, and a few remarks upon stencil-plates and their use will not be out of place. The great objection to them, is that the pattern to be repeated cannot be cut without leaving what are called "ties," which are used to hold the stencil together, and these "ties" it is seldom possible to touch in afterwards without their being apparent. The whole art of stencil-plate cutting has a rather narrow margin of limitation, and work carried out with the extensive use of stencilling is anything but pleasing. It has a thin, starved, stiff, mechanical appearance. we may borrow a hint from the Japanese method of em stencil-plates as practised by them at the present day.

(*To be concluded.*)

GLASGOW ARCHÆOLOGICAL SOCIE

AT the monthly meeting of the Glasgow Archæo Society, held on the 16th inst. in the Rooms, 2 Street, the following papers were read:—By the pr Archbishop Eyre, on "The Seal of Inchaffray;" by t William H. Macleod, B.D., Buchanan, "Note on the of St. Kentigerna, Inch Cailleach, Loch Lomond;" Mr. John Honeyman, R.S.A., on "The Sculptured St Govan Churchyard."

HISTORIC SOCIETY OF LANCASHIRE CHESHIRE.

A MEETING took place on the 16th inst., Mr. Rylands presiding over a good attendance of m and friends. A paper on "Further Discoveries at Veri was read by Mr. Thomas May, of Warrington, who be paper with a description of the site and the various s and cuttings made during the year 1898. A large nu specimens of Samian ware, bearing potters' mark, em pottery, coins, bones, calcined wheat, quern, &c., we hibited, and also a description of many objects now Warrington Museum, and interest was increased by the maps, scale drawings and lantern illustrations of the of their Roman encampment. After a short discussion of thanks, proposed by Mr. A. M. Robinson, and seco Mr. J. G. Prentice, was heartily accorded to Mr. May paper.

GENERAL.

The Late Samuel Bayliss, of Hanover Terrace, Re Park, civil engineer and contractor, who died intes November 28 last, left property valued at the 545,849*l.* 11*s.* 3*d.*, and estate duty thereon has been dulya

An Oak Screen has been erected, at a cost of abo in the chancel of St. Mary's Church, Mortimer, near R in memory of the late Mr. Richard Benyon, of Ene House, Berks. It was designed by Sir A. W. Blomfield,

Professor Kennedy, C.E., is to report on the empl of mechanical traction on the London County Council ways. His fee is to be 500 guineas, with 100 guin travelling expenses.

Mr. David McGibbon, architect, joint author w Ross of "The Castellated and Domestic Architecture land" and "The Ecclesiastical Architecture of Scotlan receive the honorary degree of Doctor of Laws fr University of St. Andrews.

M. Gustave Déloye, the French sculptor, whose de announced at the age of sixty-one, executed many commis for the State, and in 1872 he was decorated with the the Legion of Honour. He did important work for Ver and St. Petersburg, and on the occasion of the Czar's v Paris he was selected to decorate the garden of the Embassy. M. Gustave Déloye was much esteemed by late Emperor Alexander III. He was a pupil of Jouffr won the Prix de Rome in 1862.

The Second Part of "Selected Examples of Decora Art from South Kensington Museum" (Longmans, Gre Co.) contains interesting examples of wood-carving, sculpture, leather (Cuir Bouilli), glass, bronze, brass, silv brocade. For designers, manufacturers and amateurs collection of plates will be a matchless acquisition.

Mr. Morgan, a New York banker, has promised t of 5,000*l.* to defray the cost of such an installation of el light in St. Paul's Cathedral as will serve to light up the decorations.

The Château de Longchamps, which was constru for the Prefect of the Seine, has been let by the Muni Council of Paris to M. Chauchard, one of the proprietors "The Louvre."

Messrs. Mawson & Hudson have obtained the fi of 100*l.* in the competition for the fire brigade station, B The second prize was gained by Mr. W. J. Morley (B and the third by Mr. Owen Roberts (Liverpool).

The Alterations to Kensington Palace to fit it for use have been far more costly than was originally expect the first estimate a sum of 23,000*l.* was fixed, but owing to extensive scheme of renovation, necessitated by long dis the palace, this has proved inadequate, and in the supp mentary Civil Service Estimates a still further sum of 5,00 provided.

Soho Cowl & Ventilator
(NICKLIN & MILWARD'S PATENT).

This COWL has been used as a Ventilator, both on Workshops and Offices, with most satisfactory results, and has proved a conspicuous success as a House Cowl, possessing as it does great suctional power, perfectly noiseless action, and great durability, being made of steel.
The COWL has proved a perfect cure in the case of most troublesome chimneys.

TESTIMONIALS.
"I consider your cowl far above any other cowl in the market, and have much pleasure in recommending it to anyone suffering from smoky chimneys."
"Forward the 10-inch cowls on order at once; we have fixed the others and find they give every satisfaction."
"Your cowl has proved a complete success, no matter which way the wind blows. Please forward me another one at once"

TRADE NOTES.

THE new schools, Heath Town, Wolverhampton, are being warmed and ventilated by means of Shorland's patent Manchester grates by Messrs. E. H. Shorland & Brother, of Manchester.

IN the ventilation of the new Hutchesontown parish church and mission halls now in course of erection (Mr. Alex. Adam, architect, Glasgow), Cousland's improved climax patent direct acting invisible roof ventilators and air inlet panels are being used, supplied by the Climax Ventilating and Heating Company, Limited, 93 Hope Street, Glasgow.

NINETEEN gold medals in seven years is the record of the Yost typewriter, the latest addition to this formidable list of honours being the highest award at the Industrial and Art Exhibition recently held at Grahamstown. South Africa is well to the front in recognition of the merits of the Yost machine.

MESSRS. BERRY, CAMPBELL & CO., 62 Watling Street, E.C., are supplying the heating apparatus for a handsome Congregational church now being erected at Muswell Hill from the design of Mr. P. Morley Horder, on land presented by Messrs. Edmondson & Sons, owners of the estate. They have also recently supplied a very efficient heating apparatus to St. Paul's Church, Upper Holloway.

THE Vestry of St. Mary's, Ambleside, have agreed to provide new choir stalls, raise the reredos, retile the chancel, place a marble pavement in the church and carry out other improvements.

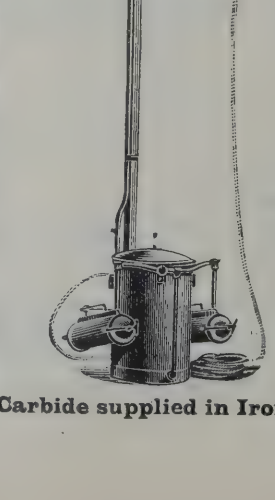
BUILDING AND BUILDERS.

THE Roman Catholics of Little Hulton and Walkden are building a new church to replace the one which was destroyed by fire on March 11 of last year. The contract is for 2,730*l.* The new church will be in Bridgewater Street, Little Hulton.

THE operative plasterers of Spen Valley, Dewsbury, Batley, Morley, &c., have given notice to their employers' representatives of a demand for an advance of 1*d.* per hour in wages, to take effect on July 1. Their present rate of payment is 8*d.*, and the hours are forty-nine and a half per week.

IT has been decided to rebuild the ancient church at Overton, near Lancaster. Although additions have been made at comparatively recent dates, the greater part of the building has existed since 1100. It is not proposed to disturb the doorway and other portions, which furnish good specimens of the Norman style.

JOHN HARKNESS, mason's labourer, 81 Carrick Street, Glasgow, died in Glasgow Western Infirmary from injuries received in Elmbank Street by tripping on a stone and falling backwards from a scaffold 7 feet high. Deceased was fifty-three years of age and married.



THE foundation-stone of the new church of St. Barnabas, at Penkhull Allotments, Stoke-on-Trent, was laid on the 16th inst. When completed the church will provide accommodation for from 600 to 700 worshippers; but at present only a portion of the building is to be erected.

THE foundation-stone of the new church of St. Peter, South Tottenham, has been laid by the Hon. Victoria Grosvenor, in the presence of a large assemblage. The new church, which is to be Early Gothic in style, will provide accommodation for 800 persons, and will cost about 8,600*l.*

EARLY on Saturday morning two labourers were killed by the collapse of a large chimney-stack at the Saxon Brick Company's yard, at King's Dyke, near Peterborough. One of the deceased—John Scotney, who resided at Whittesley—leaves a widow and eight children. The other man, who belonged to Peterborough, has not yet been identified. The bodies were shockingly crushed.

THE City surveyor (Mr. A. Murray) and Professor Aitchison (the president of the Royal Institute of British Architects) are engaged, says the *City Press*, in preparing the instructions to the six competing architects who will be asked to submit the plans for a new sessions house in the Old Bailey. The new building will probably cost over 150,000*l.* to erect.

THE Lord Provost's committee of the Edinburgh Town ouncil devoted a good deal of time on the 15th inst. to dis- ussing the proposed improvements in Portobello. It was :mitted to Bailie Brand and Councillors Grieve and Nicol to iggest sites for a proposed Town Hall capable of accom- odating 800 people. With reference to the extension of the romenade from the foot of Pipe Street to King's Road at a ost of about 7,500*l.*, and with regard to the proposal to form proper drainage system at a cost of about 12,100*l.*, the recom- endations made were recommitted back to a sub-committee.

THE awards in connection with the theoretical examination r apprentices under the auspices of the Border Counties aster Painters' Association have been announced by Mr. 'illiam Brown, Dundee, president of the National Association Master Painters in Scotland, as follows :—Class 1 (for fifth id sixth year apprentices)—1, Adam Armstrong; 2, Ebenezer annan; 3, Robert Reaveley; 4, James Black (all of Galashiels). lass 2 (for third and fourth year apprentices)—1, James Hill, awick; 2, Andrew Leslie, Selkirk; 3, William Lindsay, alashiels; 4, James M'Intosh, Galashiels. Class 3 (for first id second year apprentices)—1, James Hope, Galashiels; Alexander May, Hawick; 3, Thomas Shiel, Lauder; Robert Jack, Kelso.

THE plans by Messrs. Mawson & Hudson, of Bradford, have en accepted for the new fire-brigade station in that city. ccording to these plans, the engine-house to accommodate e engines is placed in the centre of the principal front towards elson Street, and is 84 feet long, 35 feet wide and 16 feet 6 inches gh. Immediately behind it, and communicating directly with are the stables for eight horses ready for immediate duty. The orways to the engine-house are framed in four leaves, so that engine can pass out at full gallop. Over the engine-house d duty-room is placed the gymnasium, 45 feet 6 inches by feet (which is to be used as a reading, amusement and drill- om for the men), and a dormitory or single-men's quarter, feet by 18 feet, for the men on night duty. The workshop, feet long, will be fitted with engine, lathe, drill, forge, grind- ne and work bench. The cost of the building is estimated 15,000*l.*

THE second new wing to the Temperate House at Kew rdens is now practically finished, and the whole of this lendid conservatory thus completed will soon be open from d to end.

ELECTRIC NOTES.

THE Beckenham District Council have applied for power to raise a loan of 37,100*l.* to purchase the electric lighting of the district, which is now in the hands of a company.

DURING the month of May, 1899, there will be an electrical show in Madison Square Garden, New York. The show will be under the auspices of and in connection with the twenty-second annual convention of the National Electric Light Association.

THE installation of the electric light in the Vatican was inaugurated on Monday last, and is on a very extensive scale, comprising 6,000 lamps of sixteen-candle power. The Pope said recently, in reference to this noteworthy event in the history of the Apostolic Palace, "People will not be able henceforth to reproach the Vatican with being the enemy of light."

ABOUT a score of students from the engineering department of the Yorkshire College paid a visit on the 16th inst. to the Leeds electric power station, Crown Point, Mr. Burbidge, the chief electrical engineer of the tramways department, being present to receive them. The station contains two large horizontal compound condensing engines, each of 400 indicated horse-power, which were constructed by Messrs. J. Fowler & Co. The dynamos were made by Messrs. Greenwood & Batley. Only one of the engines was working at the time, considerably less power being required during the winter months, when very few people visit Roundhay Park. The students, who were favoured the other evening with a lecture on the Leeds electric tramways by Mr. E. Talbot, consulting electrical engineer to the Corporation, appeared to be greatly interested in what they saw.

VARIETIES.

LADY MARGARET ORMESBY-GORE formally opened a new art school for Oswestry and district on the 16th inst.

ON Wednesday morning the Grange, the mansion of Sir Chas. Nicholson, at Totteridge, near Barnet, caught fire, and before effective help could be rendered from Edgware or Hendon the place was burned out. The Grange is historic as the residence for many years of Bulwer Lytton, who there wrote "The Last of the Barons."

loor we fitted in these works, although subjected to a heat intense enough to melt brass taps and fittings near it, withstood the heat perfectly, and can now be inspected at s in Manchester, fit for duty. The metal sheets have expanded without becoming detached, whilst the wood is simply charred to a depth of about ⅛ of an inch.

FULL PARTICULARS AND ESTIMATES FREE

A MEETING of the Northern Architectural Association will be held on Wednesday next, March 1, at 7.30 P.M., at the meeting-room, Art Gallery, Newcastle-upon-Tyne, when Mr. J. Walton Taylor will read a paper on "The Bricks used in Northumberland and Durham."

A CURIOUS offertory towards the restoration of the parish church of Bishops Cleeve, near Cheltenham, has been handed to the vicar by one of the churchwardens. It consisted of a soda-water bottle filled with threepenny bits. When the curious purse had been emptied of its contents it was found to have contained the sum of 7*l.* 10*s.* 6*d.*, or, in all, 602 pieces.

THE freedom of the Plumbers' Company will to-day be presented to Sir Hugh Owen, G.C.B., late secretary to the Local Government Board, at Guildhall. Mr. Chaplin, president of the Local Government Board, the Lord Mayor, Mr. McKinnon Wood, chairman of the London County Council, and others will be present at the ceremony.

AT the last meeting of the Birmingham City Council a number of memorials were presented in favour of the establishment of a natural history museum. They were referred to the general purposes committee, and at a meeting of that committee it was decided to hand them over to the special sub-committee appointed to consider the whole question of the extension of the Council House.

MR. C. J. STEWART, clerk to the London County Council, will preside at the annual general meeting of the Municipal Officers' Association, to be held in the Council Chamber, Guildhall, E.C., on Tuesday, February 28, at 8 P.M. Mr. G. L. Gomme, statistical officer, London County Council, will address the members on "The London Government Bill, and how it will affect the present position of London Governing Authorities."

PLANS have been submitted to the London County Council for building houses and shops on the Wentworth House estate at the corner of South End Road and John Street, Hampstead Heath, adjoining the house known as Lawn Bank, John Street, in which the poet Keats lived, and is said to have written the "Ode to the Nightingale," &c. Keats was also a frequent visitor to Wentworth House.

MR. HENRY MATTHEW, town clerk, Cupar, N.B., died at his residence there unexpectedly at the early age of forty-six. Though not in good health for a year, he was still able to attend to his duties, and officiated as clerk at the last monthly meeting of the Council. A native of Springfield he began life as a clerk in the office of the late Provost Welsh Tennent, Cupar, and was afterwards a partner of Welch & Matthew 1877, but resigned that position a year ago. The town clerksh he has retained since 1881. He was a man of excellent bu ness capacity, and ably served the town's interests in importa negotiations with the Fife and Kinross Lunacy Board and oth public bodies.

AN octagonal Gothic structure, 32 feet in height and 7 fe in diameter, standing upon a platform of steps, has been late unveiled in the town of Horncastle. It has been erected l public subscription in memory of the Right Hon Edwa Stanhope, M.P., late Secretary of State for the War Depa ment, and contains a bronze medallion likeness. It consists three stages, the lower one being solid of Monk's Park sto with diaper panels between polished red granite shafts a crocketted pediments above. The middle stage is an op arcading, consisting of polished red granite columns wi carved Monk's Park caps and a double set of trefoiled wo above; the third stage consisting of a lantern covered wi lead, supported by gun-metal shafts, and finished by an orn mental finial of same material. The design was selected open competition out of about seventy responses, and is t work of Mr E. H. Lingen Barker, of London and Herefo the contractors being Messrs. Walter & Hensman, of Hor castle, and the sculptor Mr. C. J. W. Ladds, of West Keal.

A FEW days since an outbreak of fire at the South Lond Music Hall was reported, but fortunately extinguished by t application of the hydrants, &c., kept on the premises. Th was followed by the saving of the Bedford Music Hall by o of those handy fire-extinguishers, the "London Brigade" ha pump, several of which are kept in the building. We n learn that Sir James Whitehead's mansion near Dartford h a narrow escape from destruction, but here also fire applianc were maintained and used to advantage. These results m be a source of gratification to Messrs. Merryweather & So who fitted up each of the above establishments with th material.

WORKMEN'S COMPENSATION ACT COSTS.

AT the Southwark County Court, on the 20th inst., his hono Judge Addison, Q.C., gave his decision on an important po in respect to costs under the Workmen's Compensation A when arbitrations have been preceded by actions under t Employers' Liability Act. An action (Skeggs *v.* Keen & C under the Employers' Liability Act had been heard by h

ıonour and a jury, and a verdict given for the defendants. His ıonour gave judgment for the defendants with costs, and on he application of the plaintiff he assessed compensation under he Workmen's Compensation Act at 23*l.* 4*s.*, upon which he llowed costs. The registrar (Mr. Bros), in carrying out such rder, taxed the defendants' costs at 26*l.* 9*s.* 6*d.* He then axed the plaintiff's costs as if the plaintiff had brought an ction under the Workmen's Compensation Act, and fixed the mount at 25*l.* 8*s.* 6*d.* The defendants thereupon moved the Court by their counsel, Mr. Ellis Hill, for his honour to remit he taxation to the registrar upon the ground that subsection 4 f section 1 of the Act had not been complied with. The uestion was as to how the wording of the subsection was o be applied to such an order, *i.e.* where under the Em-loyers' Liability Act judgment had been given for the defend-nts with costs, and the Judge had proceeded to assess amages under the Workmen's Compensation Act, also with osts. It was contended for the plaintiff that he was entitled to ave all the costs that he might have incurred in an action nder the Workmen's Compensation Act set off against the osts which he was liable to pay under the Employers' Liability ct. Mr. Ellis Hill submitted that in this particular case the orrespondence showed that the defendants were willing to llow the plaintiff's claim under the Workmen's Compensation ct, so that no costs would have been incurred under that Act, r that, at least, the defendants would in such an action have dmitted in their answer all or some of the plaintiff's claims. lis honour held that it was the duty of an arbitrator (or judge tting as such), in applying this section, to enter upon these quiries so as to ascertain the costs which had been caused by ıe proceedings under the Employers' Liability Act, and decided Mr. Ellis Hill's favour. His honour remarked that the sub-ction was a most difficult one to apply in practice, and he ould not help thinking that if those who drew it had anticipated ıe questions that would arise under it they would have drawn very differently.

A NEW ELECTRICAL TRADES DIRECTORY.

HE seventeenth edition of the "Electrical Trades Directory," ublished by the *Electrician* Printing and Publishing Company, imited, has been considerably enlarged, and now comprises bout 1,600 pp. royal 8vo, of exceedingly useful information, ndsomely and substantially bound in blue cloth, lettered. It is divided into three several divisions. The handbook division contains *inter alia* an exhaustive digest of the law of electric lighting and electric traction. Specially prepared large folding sheets, printed on special paper, give exhaustive and most complete particulars of the electricity supply stations of the United Kingdom.

A list is given of the railways and tramways in Great Britain and Ireland in which the motive power (either actually in use or contemplated) is electricity, together with the company or local authority working them, the systems employed, and the length of the lines. Another feature which no doubt is found to be of considerable value, *i.e.* financial particulars relating to electrical limited liability companies, has been greatly extended, and the information given has been very carefully revised and corrected. It contains tabulated information concerning all the leading electric lighting, electric railway and tramway, telegraph and telephone companies, with the dates of registration, the chief officials, the nominal authorised capital, &c. In the Directory division the continued growth and progress of the electrical industry has necessitated a large increase in the size of this portion of the book, and although names of firms, &c., having only a remote connection with electricity are excluded, some 11,000 are given; and the Biographical division contains sketches of the lives of 286 persons well known in the electrical world, all of which have been revised by the subjects of the notices.

MESSRS. FLETCHER, RUSSELL & CO.'S NEW WORKS.

THE neighbourhood of Wilderspool Road, Warrington, was on the 15th inst. *en gala* on the occasion of the formal opening of the handsome and commodious new works which have been erected there by Messrs. Fletcher, Russell & Co., Limited, the well-known gas-engineers and artistic iron-founders, of London, Warrington and Pendleton. A large party was invited, and the proceedings passed off with a cheeriness and *éclat* which may be taken as an excellent augury of the future success of the new works, which are situated between Wilderspool Causeway and the low-level railway of the London and North-Western Railway Company near Arpley station. The main entrance is placed in the centre of a handsome building of brick and stone, consisting on the ground floor to the left of the entrance of time-office, inward goods and stores department, and on the right-hand side

there are dining-rooms for the workmen, and temporary iron pattern stores. On the first floor are spacious offices, board-rooms, &c., and the top floor is set apart for large show-rooms. The offices and show-rooms, now nearly finished, will afford excellent facilities for the requirements of the business in the future. Entering the works, the visitor approaches a large three-storey building with spacious cellars and attics, used as a warehouse and despatch department for goods. An electrically-driven hoist conveys the goods from floor to floor. Running alongside the south side of this building is the loading stage and shed, with a convenient railway siding from the London and North-Western. Here goods will be placed in railway waggons for despatch. On the other side of the siding the boiler-house and economiser are situated, also the works chimney, which is 140 feet high. Opposite the boiler-house, and adjoining the warehouse, there are two one-storey buildings, consisting of testing department for burners and other gas apparatus, also under the same roof a blacking shop and stove. Immediately adjoining are the grinding and polishing departments, the machinery of which is driven direct by belt power from the fine engine house, which is situated at the end of this building. The engine house contains a splendid compound tandem engine, indicating about 130 horse-power. From the main counter shaft in the engine house there are two generating dynamos driven, one for distributing electric power to the various departments and the other for lighting the entire works by electricity. On the north side there is another fine block of buildings two storeys high, with commodious attics. The ground floor is used entirely for part of the fitting shop, with heavy machinery for stamping, drilling, punching, cutting, &c, and on the second floor there is another fitting shop for the drilling of light fittings, &c. The tinsmiths' department is also on this floor. The machinery is driven by belt power from the main shafts, the latter being driven by electric motors, supplied by current from the generating dynamo in the engine house. There is an electrically driven hoist in the fitting shop for conveying goods to the floor above. There is also a smithy and box-fitting department, 60 feet by 25 feet, in close proximity to this building, fitted up with the most modern appliances, the machinery being driven by electric power similar to the fitting shop. There is a large block of buildings one storey high, with six roofs running parallel with the end of the fitting and grinding departments. Leaving the smithy, the visitor enters the inspector's or stock-taker's department, in which all castings manufactured are inspected and credited to the moulders. In a line and under the same roof is the dressing department for the cleaning of castings. Adjoining this is the machine dressing department, having rumbling barrels and emery wheels, and a fan for extracting the dust from the various machinery, this being driven by an electric motor. Under the same roof at one end is the blower room, containing the blower, driven by two electric motors, from which the blast is driven into the two cupolas. Around these cupolas the staging and roofs are erected, which are about 90 feet long by 26 feet broad, having all the most modern appliances necessary for the production of light iron castings. At the end is a hoist, driven by electricity, for taking materials to the stage above, 20 feet high. Close to the cupolas is the sand-house, containing grinding and mixing mills, also stove and hot floors for the drying of bogies and ladles used for handling the molten metal. Running along the same is another section of the railway siding, affording facilities for the discharge of iron, coke, sand, coal, &c, to these stoves, cupolas and boiler house. The visitor now passes into the moulding shops, which have an area of about 2,400 square yards splendidly lighted and ventilated, the entire floor being laid with brick in cement. This building can be lighted throughout by electricity. The works have been designed by Mr. Alex. Neil (vice-chairman of the company), and his design has been carried out by Mr. J. E. Wright, architect; Mr. Davenport, builder; and Mr. Broadhurst, clerk of the works. The erection of machinery, general appliances, cupolas, &c. was supervised by Mr. Alexander Neil (managing director) and Messrs. W. R. Neil and E. L. Fletcher (directors), also Mr. T. Bower (senior foreman and engineer). The general plan of the entire works gives every facility for the economical and quick handling of the castings to the various departments, which are heated by steam and electrically lighted throughout. There are gangways connecting the various buildings. The works when finished, will be second to none of any similar kind of works in the United Kingdom.

BRICKFIELDS.

On Monday a paper was read by Mr. J. L. Crouch at the Surveyors' Institution on the management and valuation of brickfields. Commencing with a brief description of the geology of plastic clays, it was pointed out that brick-earths are classifiable as clays, as loams, as marls, Kaolin, &

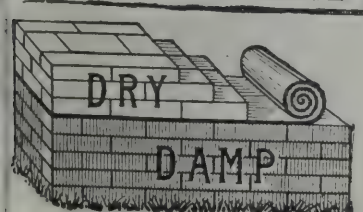
Vol. LX. of THE ARCHITECT. Handsomely Bound in Cloth, Price 12s. 6d. Office: Imperial Buildings, Ludgate Circus E



"china clay," and various methods of manufacturing were described, and the differences between pipeclay and other kaolins was noted. The plasticity of clay, depending upon chemically-combined water, the colouring matters of clay, and the reasons that some beds are valueless were explained. The relative proportions of silica and alumina in clay, and their bearing on heat-resisting qualities; the methods of taking samples of clay, by test-holes and borings; and the modes of analysis adopted for clays were next discussed, this being followed by a description of the methods of brick-making near the Metropolis and of the implements in use. The legal part of the subject involved a discussion of brickfield leases. Clay is usually paid for by surface rents and royalties. The lessee is required to remove the top soil before digging for clay—a process known as encallowing—and to replace it at the end of the tenancy. No clay can be removed to other yards without a special covenant, and none can be brought into a yard unless the full royalties are paid. The ultimate use of land after the removal of clay forms the subject of special covenants. Where land is to be levelled sections should be shown of the present level and of the intended final level. The provisions for filling in pits received attention, and cases were cited illustrating the general method of rating brickfields. The paper closed with a definition as to what plant constituted landlord's fixtures, and reference was also made to the valuation of brickfields.

FOREST WEALTH OF BRITISH COLUMBIA.

BRITISH COLUMBIA may be said to possess the greatest compact area of merchantable timber on the North American continent, and if it had not been for the great forest fires that have raged in the interior in years gone by, during which a very large portion of the surface has been denuded of its forests, the available supply would have been much greater than it is. As far north as Alaska, according to a recent report by the secretary of the British Columbia Bureau of Statistics, the coast is heavily timbered, the forest line following the indents and river valleys and fringing the mountain sides. Logging operations so far have extended to Knight's Inlet, a point of the coast of the mainland opposite the north end of Vancouver Island. Here the Douglas fir, the most important and widely dispersed of the valuable trees, disappears altogether, and the cypress or yellow cedar takes its place. North of this cedar, hemlock and spruce are the principal timber trees. It will be of interest to know that Douglas fir was named after David Douglas, a noted botanist who explored New Caledonia in the early part of the century. It is a very widely distributed tree, being found from the coast to the summit of the Rocky Mountains, and as far east as Calgary and as far north as Fort McLeod. On the coast it attains immense proportions, sometimes towering 300 feet in the air and having a base circumference of from 30 to 50 feet. This is the staple timber of commerce often classed by the trade as Oregon pine. It has about the same specific gravity as oak, with great strength, and has a wide range of usefulness, being especially adapted for building purposes. It is scientifically described as standing midway between the spruce and the balsam, and in the opinion of the Dominion naturalist is a valuable pulp-making tree. Probably the two next most important representatives of the forest wealth are the red cedar and the yellow cedar. The former is found all over the province, but reaches its greatest development on the coast where it outgirths all others. In addition to its commercial value for shingles and finishing purposes it is the friend of the settler, inasmuch as out of its straight-grained logs he can build his house, make his furniture and fence his farm, and that with the use of the most primitive tools only. It is especially valuable, however, for interior finishing, being rich in colouring, and taking a beautiful polish. For this purpose it is finding an extended market in the east of Canada. Important as the red cedar is, the yellow cedar, though much more limited in area and quantity, is still more important and useful. It is very strong, comparing with the Douglas fir in this respect, is wonderfully durable, finishes to perfection, and grows to great dimensions. The cypress, which is found in great quantities in the interior of Vancouver Island, and on Mount Benson, near Nanaimo, comes within 1,200 feet of the sea. Towards the end of the island, on Queen Charlotte Islands, and on the north coast of the mainland, it is found lower down and is very plentiful. It is out of the cedar that the Hydah Indians build their celebrated war canoes, some of which have an 8-foot beam, are 60 feet long, and can stem the heaviest seas of the coast waters. Next comes the white spruce. Its habitat is principally low, swampy and delta lands, usually interspersing the forest of fir and other trees, but in no place is it found in very large or compact bodies. From its comparative scarcity and the many uses to which it may be put, it is commercially more valuable than the

PATENT
VULCANITE ROOFING.

Since the introduction of the patent Vulcanite Roofing into this country it has been adopted by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospitals, Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summer than under any other roof. When properly laid repairs are never required, and all roofs are guaranteed. The roof-surface can be used as a garden, or for any other purpose. The cost of construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGES, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to 40 inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower and quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and for SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 superficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires no annual coating.

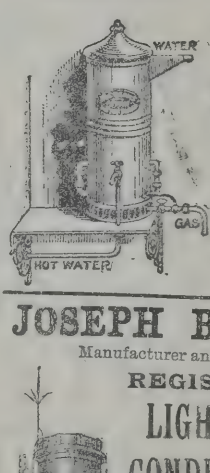
Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.

THE PATENT VULCANITE ROOFING & ASPHALTE CO., LTD.,
OLD FORD, BOW, LONDON, E.

Inquiries from the North of England, Scotland, and Ireland, please address to Laganvale, Belfast.
Agents wanted in all districts where not yet represented for laying of Vulcanite Roofs and Sale of Sheet Asphalte.

Douglas fir. It attains a circumference almost equal to the latter, but does not grow so tall or so clear of branches. It is utilised largely in making doors, salmon-boxes, barrels, fruit-boxes, and many other similar purposes, being as it is the best adapted for these uses of all the native timbers. It is *par excellence* the wood for pulp manufacture, which is expected to become one of the most important industries of the province. Hemlock is a common timber, and up the coast is found in considerable quantities. It is a useful tree, and answers about the same purpose as the Douglas fir, and for that reason it will not be in general demand until the latter has become to some extent exhausted. White pine for cabinet purposes and general utility is very valuable, but is limited in quantity. Balsam is widely distributed, being found principally in river valleys, but is commercially of little value except for pulp. With the exception of the yew and tamarack, of which there are several varieties, the foregoing are the representatives of the family of coniferous trees. Of deciduous trees, the large leaf maple, vine maple, alder, crab apple, oak, two varieties of poplar or cotton-wood, and aspen poplar, arbutus, birch, willow and juniper, are the principal. The maple, alder and arbutus make first-class cabinet woods, though they are not abundant enough to be extensively used for this purpose. They also make popular finishing woods. Poplar, or as it is most commonly called, cottonwood, will, it is expected, in the future be greatly used in paper making. The aspen poplar is common in Vancouver Island and the northern interior of the province. It is also a good paper maker. The oak is mainly confined to the southern end of Vancouver Island. It is a stunted, gnarled species, of little use, but very picturesque. Crab apple is plentiful in swampy places, around ponds, beaver meadows, and along river banks. The hard woods are usually found in bottom lands and indicate fruitfulness of the soil. There is no part of British Columbia where the timber supply is not sufficient for local demands. There are over eighty sawmills in the province, large and small, with a daily capacity of about 2,000,000 feet, mainly on the coast, but the limit has never been reached, the annual cut running between 50 and 100 million feet. Various estimates have been made of the amount of timber in sight. These range between 40 and 100 billion feet. The average of timber under lease is about 1,175 square miles, and the total area of forest and woodland is put down by the Dominion statistician as 285,554 square miles, but this must not be taken as all of commercial value, as much of this is covered with small trees suitable only for a local supply of fuel and lumber. The future of the lumber industry in British Columbia is very promising, and when foreign demand fully revives, and the Nicaraguan Canal has been completed, it cannot fail to receive an immense impetus.

SOUTHAMPTON MASTER BUILDERS' DINNER.



THE annual dinner of the Southampton and District Builders and Decorators' Association was held at the Swiss Café Restaurant, Southampton, and there was a large and representative attendance. Major Brunton, ex-president of the Association, who presided, was influentially supported.

The Chairman submitted the Royal toast, which having been duly honoured, Mr. H. N. Jenkins submitted the toast of "The Trade and Commerce of Southampton." The speaker referred to the strides which trade was making in the town, a result which he was sure must be most satisfactory and gratifying to them all. He also referred to the impetus which had been given to trade by the energy and go-aheadedness of the London and South-Western Railway Company. The toast was coupled with the name of Mr. Peter Stewart, and was received with enthusiasm.

Mr. Peter Stewart, in the course of an able response, said they in the shipping trade thought the builders had had it all their own way. Houses had gone up by the mile, but they had not been able to bring ships there by the mile, though they were erecting quays almost by the mile, and he hoped that would bring prosperity to all. Southampton was one of those ports where they could never make much of what they called the tramp trade, but they hoped to increase it. Notwithstanding the Spanish-American war, there had been an increase in tonnage of 832,682 tons in 1898, and that showed that they had not gone backwards. After a reference to what the coming of the L. & S.-W. R. Company as owners of the docks had meant to Southampton, the speaker concluded by thanking the company for the manner in which they had received the toast.

"The Mayor and Corporation and Borough Officials" was the next toast, and it was proposed by Mr. G. Franklin and responded to by the Mayor in a genial speech, after which the borough engineer, who met with a cordial reception, said that in 1600 there were 400 houses, nearly all under the ancient walls. In 1830 there were 4,500 houses and a population of 19,000. About twenty-five years later there were 14,000 of 15,000 houses and a population of 57,000, whilst at the present

time there were 22,000 houses and a population of over a hundred thousand. There was an old saying that God made the country and man made the town, and he believed "man" was the builders, to whom the whole community should be grateful for developing the good old town of Southampton.

"The Architectural Profession" was then given in felicitous terms by the vice-president, Mr. H. Cavte, and Messrs. A. F Gutteridge, W. E. Mitchell, and Mr. S. Kelway Pope briefly responded.

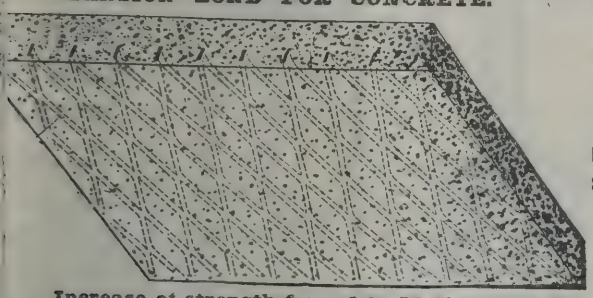
Mr. Thomas Costigan proposed the toast of the evening, "Master Builders and Decorators' Association and Kindred Associations," and met with a hearty greeting.

INCORPORATED INSTITUTE OF BRITISH DECORATORS.

THE idea of forming an Institute for those engaged in the art and business of painted decoration, and having objects allied to those with which the institutes such as those of engineers, of architects and of surveyors have been formed, seems to have originated within the present decade, and to have taken more definite shape at a meeting of the National Association of Master Painters at Manchester in 1894. Endeavours were made to obtain a charter last year, but objections being found it was decided to incorporate the Institute under the non-trading clauses of the Limited Companies Act, and after some years of persevering effort the Institute was finally registered as incorporated on January 21 this year. The first meeting of the Provisional Council since incorporation was held at Painters' Hall on February 8. This Council, consisting of twenty-five members, is representative of England and Wales, Scotland and Ireland, Mr. Crace, of London, being president. They at once proceeded to elect officers and arrange for the organisation and working of the Institute. Mr. W. H. Pitman was elected treasurer, Mr G. Petter auditor, and Mr. F. W. Englefield (of Messrs. Pritchard, Englefield & Co, solicitors) secretary. The first general meeting is appointed for March 23 at Painters' Hall, Little Trinity Lane, where the new Institute's headquarters will for the present be situate.

In noticing the definite formation of this Institute, it is only just to say that although it will have its headquarters in London, its origin and its preliminary organisation are almost entirely due to the initiative and the persevering efforts of representatives of the northern counties, and particularly also of Scotland, where Mr. Thomas Bonnar, of Edinburgh, and Colonel Bennett, of Glasgow, have been its constant and energetic supporters; most valuable of all, however, have been the indefatigable services of the interim secretary, Mr. W. B. Crawford, of Glasgow, to whom no trouble or difficulty seemed deterrent and no labour superfluous. The unanimity with which this opinion was expressed at the meeting was itself a testimony that his efforts were appreciated.

RESPONSIBILITY OF CORPORATIONS.



AT the Northampton assizes Thomas Brown, a baker, of Northampton, claimed damages by reason of the Corporation permitting water to flow upon the premises of the plaintiff.

In his pleadings, says the *Northampton Herald*, the plaintiff alleged that the Corporation, by their workmen, from the beginning of 1897 to about December 7 of that year allowed water to flow from a pipe connected with a main in Junction Road, whereby he suffered by reason of the water percolating through the ground from the pipe to his premises, causing the buildings to become damp and subside, and diminishing the heat of the ovens used by the plaintiff in his business. The special damage was put down at 11*l.* 15*s.* 7*d.*, expended on the discovery of the source of the nuisance and partially stopping it, and 8*l.* 2*s.* 6*d.* expended in extra fuel necessitated by the diminution of heat from the damp. Plaintiff claimed 200*l.* damages.

The defendants pleaded no injury was done, but if done there had been no negligence on their part. They further pleaded the time had gone by in which the action ought to have been brought.

Plaintiff in his evidence stated he had carried on business as a baker and confectioner for six years, and up to 1897 had used two patent ovens. Early in 1897 it was found sufficient heat could not be obtained for the ovens, and matters became worse. He had no idea of the cause, and had the ovens cleaned out on three different occasions by Mr. Hickman, builder, but matters did not improve. Plaintiff then sent for an expert from Manchester, and he stated the ovens and flues were in perfect order. The expert suggested the cause of the loss of heat might be through an escape of water, and plaintiff then had a hole dug down to the foundation of the stoke-hole, and

THE PROBLEM SOLVED.
ORDINARY WOOD RENDERED FIRE-RESISTING THROUGHOUT WITHOUT AFFECTING ITS UTILITY AS A BUILDING MATERIAL.

on going down about a foot and a half found water. The deeper they dug the more water was found. They baled out about 120 gallons a day, and that went on for about a fortnight, until Mr. Hickman opened the ground in the road and underneath the pavement, and found a leaky pipe. This was stopped, and after that time the flow of water ceased and the ovens were better heated. Plaintiff had had a new oven built before the leakage was discovered. The end of the pipe in question was about 3 feet from the old oven. Plaintiff built a new oven at a cost of between 50*l.* and 60*l.*, because he could not get any heat in the old one, and could not carry on his bakings properly. If the old oven had worked properly it would not have been necessary to build the new one. He paid Mr. Hickman 11*l.* 15*s.* 7*d.* and the expert 2*l.* 0*s.* 5*d.* Plaintiff expended on extra fuel in connection with the old oven the sum of 8*l.* 2*s.* 6*d.* for the year. He had lost trade on his dinner bakings, and also in his bread customers, as the bread could not be made properly. Since the stoppage of the water the walls of the ovens had cracked through subsidence near, and allowed the fumes of the coke to get into the oven and damage the bakings. He did not notice the cracks until six months after the stoppage of the water, and they gradually increased; in fact, he did not think the cracking had yet stopped.

Cross-examined: All the leaking of the pipe ceased in 1897 but not the damage to the oven. The pipe had been taken away by the Corporation, but a certain amount of water remained in the ground. He first noticed the cracks in June 1898, and although six months had elapsed since the stopping of the leakage, he though it resulted from the water having been in the foundations. He did not call the attention of his solicitors to the cracks or subsidence until some time after they had occurred, as he had previously sent in his claim. He only complained of the subsidence on January 24 last. A gate was put down near where the leaking took place about five years since, and posts were sunk in the ground, but only to a little depth.

Why do you look so bashful?—I am not bashful.

Mr. Stanger: You said he looked bashful.

His Lordship: He shied a little at the posts, I think, Mr. Stanger.

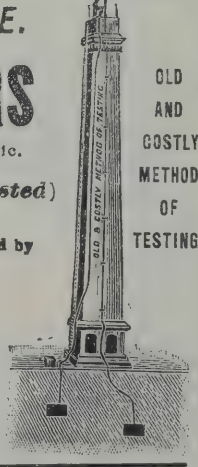
The pipe was taken away in March, 1898, and the damages had increased since owing to the cracks spoken of, which were the cause of a loss of heat to the ovens. He believed he had under-estimated his losses. The loss on fuel was irrespective of the new oven. He believed that 120 gallons a day came from the pipe in question, as the water ceased when it was taken away. The foundations, in his opinion, were injured by the water. He did not remember whether his old oven had a concrete bottom or not; he thought not. Such a bottom depended upon the nature of the foundation. Ovens sometimes cracked from heat when first built. His new ovens had cracked a little.

Re-examined: Plaintiff did not think 50*l.* would repay him for the damage he had suffered. There had been old posts where the new ones were put down for nineteen years, and they did not damage the water pipe.

Mr. Buszard said his suggestion was that when the excavation was made somebody damaged the pipe (produced), and had stopped up the ends in what he termed the bungling way they now saw.

John Faulkner Stops, articled clerk to Messrs. Becke & Green, said no information was received as to the cracks when the statement of claim was put in. He did hear of the Corporation's objection to the time a few days only before the receipt of the defence.

Mr. Robert Hickman, builder, Shelley Street, deposed to making the excavations alluded to, and to finding the water at the furnace hole and also under the pathway near. He ultimately found the water collected in consequence of the defective state of the pipe produced. He considered the pipe in question had not been properly disconnected, but such a plan was pursued at the time, he supposed, the work was done. He found water 20 inches in depth, and a hole of about 18 inches in width, which the water had made. When the water was taken away the ground afterwards subsided, and he thought that accounted for the cracks in the old ovens. He thought the cracks in the new ovens were caused by overheating at first, and not by the water. The cracks were, in his opinion, greatly injurious to the old ovens, and the damage could not be remedied without rebuilding the ovens.



Cross-examined: The service pipe in question was placed there first by the Corporation at the request of the builder, and the Corporation would make the disconnection when the pipe was no longer required. The builders were not allowed to touch the pipes. It was his opinion the cracks were caused by the subsidence. No excavations were made when the gate spoken of was erected, as the new light posts were nailed to the old ones, put on nineteen years since.

Henry Sale, builder, Kettering Road, said that about six

VOLUME LX. OF THE ARCHITECT
Handsomely bound in Cloth, Gilt Lettered, price
Office: Imperial Buildings, Ludgate Circus, London

years ago he was engaged in building near the plaintiff's premises, and had a water-pipe laid on. When he had no further use for the water the Corporation sent men to cut it off. That was about July 1892.

John Winsor, oven builder, gave evidence as to the existence of the cracks in January this year in the old ovens, and said he thought they were caused by the subsidence created by the previous existence of water underneath.

By Mr. Buszard: He considered the cracking proceeded from the existence of water near some fourteen months since, although the hole made by the water was filled up at that time. The cracks did not proceed from the bad building of the oven. If the ovens were not built on a concrete bottom they probably might crack; it was not necessary, however, in some cases to have such bottoms.

John George Hines, baker, Northampton, also gave evidence as to the existence of the cracks, and said they would have a very injurious effect on the bakings. He thought it better for an oven to have a concrete foundation, but some had not.

Frederick Hall, Northampton, deposed to erecting the gate-posts spoken of, and said one was fixed to an old post and the other plugged to the wall. The post only went down about 6 inches into the ground, and no damage was done to the water-pipe.

Mr. Abraham Mosley (Mosley & Anderson), architect, Northampton, deposed to preparing plans for the new oven for the plaintiff in 1897. He had examined the old ovens, and found cracks in the walls which were very detrimental to the value of the ovens. He did not think the damage could be properly remedied without rebuilding the ovens. He thought the subsidence alluded to would be gradual after the removal of the water, although the hole was filled up, and continued to get worse.

By Mr. Buszard: He did not think, in the instance in question, a concrete bottom was altogether necessary.

This was the case for the plaintiff.

Mr. Buszard, for the Corporation, submitted the alleged damage to the walls having occurred more than six months before the action was brought, must be considered as out of the case, and quoted the Public Authorities Prevention Act of 1893, sections 66 and 67, in support of his argument.

Mr. Stanger, in reply, argued that there was a continuation of the damage, and that the action could be brought within the six months for the one point which would include the whole of the heads.

His Lordship was against Mr. Buszard.

Continuing his defence, Mr. Buszard admitted there might have been some leakage from the pipes belonging to the Corporation some fourteen months ago, but that was not the fault of the Corporation, but arose from some extraneous cause which they were not exactly able to arrive at. It was not, he submitted, the fault of the Corporation officials in any way. The damages were divided into three heads, the first being that the buildings became damp, the second that the heat of the ovens was diminished, and thirdly, that there had been a subsidence in consequence of the action of the water. As to the first two points, it might be true that some trifling damage had resulted. He, however, submitted very strongly that the evidence that had been laid before the jury on those points was of the most shadowy and rotten character. No real damage had been shown, he contended, and no good evidence had been called to support it in order to warrant the amount of damage claimed being awarded to the plaintiff. As to the question of subsidence, they had been told it was caused by the leakage of water some fourteen months ago, when that leakage was stopped, and they heard nothing about it until recently. He strongly submitted the case had not been made out on that head. The leakage, he argued, might have been caused by natural water, and that part of the claim was put forward to bolster up an action which was very flimsy before. The plaintiff in March last set down his damages at 50*l.*, and now because of the subsidence it had been increased to 200*l.*, which he submitted was an exorbitant amount. His case was that no damage had been proved, and that if any damage had taken place it was very trifling.

George York, who had been in the service of the Corporation for twenty-two years, and prior to that in the service of the Water Company, said he recollected the service pipe in question, and cutting it off in 1892. He did not hammer up the pipe as produced in Court, and had never hammered up one like it.

By Mr. Stanger: A different system had now been adopted for closing the pipes. They left the ground open for some time, and there was no leakage.

Thomas Hooten, a workman in the service of the Corporation, gave similar evidence, and said he thought the end of the pipe produced had been tampered with in some way.

Robert Spring, foreman of the Water Works of the Corporation, said he found there was a leakage in the service pipe in question on December 21, and he had it closed up. On the

following morning the supply to the pipe from the main was completely cut off, and there had been no leakage since. Pipes often got broken or pecked into, and sometimes by the surveyor's men.

Mr. John Eunson, water engineer, said he had known pipes closed in the way the one produced had been, and remain perfectly safe unless tampered with, and the one in question appeared to have been tampered with. He did not think the pipe had been hammered up by a skilled workman; and, further, he did not think it was possible 120 gallons of water a day could be forced through the small aperture in the pipe with the force of water they had. There was a great deal of natural water, in his opinion, on the land on which the plaintiff's premises were built. He did not think the pipe could have been hammered up as it was at the present time by one of the Corporation workmen.

By Mr. Stanger: A skilled workman might certainly be so careless as to cobble up the end in the manner seen.

His Lordship asked Mr. Stanger how much the old oven cost, and the plaintiff said 16*l.*

Mr. Buszard then called Mr. G. J. Fisher, builder, Northampton, who stated the present cracks could be repaired for about 2*o*/.

Mr. Buszard and Mr. Stanger having addressed the jury, his Lordship summed up the case to them.

The jury retired, and after an absence of a quarter of an hour, returned with a verdict for the plaintiff, and assessed the damages at 90*l.* A certificate was granted for special jury.

NATIONAL REGISTRATION OF PLUMBERS.

THE tenth annual meeting of the District Council for Forfar, Perth and Fife was held at the Town House, Dundee, on Saturday. Mr. Walter M'Gregor presided, and there was a large attendance. The secretary's annual report stated that there were at the present time 69 masters and 153 journeymen upon the register. The classes at the Technical Institute, Dundee, and in Perth had been well maintained during the year. In the Dundee classes there were 45 on the roll. It was greatly to be desired that three or four of the journeymen would take the opportunity of joining the class for teachers to be held by the Plumbers' Company at King's College, London, next summer. The meeting then re-elected the retired public representatives on the Council, adding Mr. James Mitchell, organising secretary to the Fife County Council, and substituting Dr. Robertson, medical officer of health for Perth, in the room of Dr. Simpson deceased. The retiring master plumbers' representatives were re-elected, with the addition of Mr. James Littlejohn, Arbroath. Messrs. Dewar, Fimister, Goldie and Mackay were re-elected operative plumber representatives, with the addition of Mr. Hutton. The retiring office-bearers were re-elected, viz. President, Lord Provost M'Grady; vice-presidents, ex-Provost Basingall, Councillor Elliott, Dr. Templeman and Dr. Lennox; secretary, J. J. Henderson.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously*]

APPLICATIONS FOR PATENTS

2613. George Brown Davis, for "Improvements in apparatus for the ventilation of water-closets, urinals and such like places of convenience."

2769. Samuel Stevens Hellyer, for "Improvements in water-closets, slop sinks and the like."

2798. John James Hammond, for "An improved roofing tile."

2915. Tom Walton, for "An improved chimney pot, cap cowl or ventilator."

2918. William Ernest Morum and Alfred Jones, for "A sanitary appliance for water-closets and the like."

2921. Francis Augustus Remington Neill, for "Improvements in the manufacture of bricks and the like."

3026. Heinrich Koppers, for "Coke oven with apparatus for utilising the hot waste gases."

3077. Robert Ingham, for "New or improved means or method of ventilating chimney pots, stacks and buildings."

THE WEEK.

We have due respect for my lords of the Committee of Council on Education, but we must say there is a little of courageous FEEBLE" in the declaration, apropos of the report of the select committee on museums, that they desire to emphasise the fact that they alone are responsible to Parliament for the administration of the museums, and to declare that their directions have been loyally carried out by the staff and that they retain the fullest confidence in Sir JOHN DONNELLY and his colleagues." The question will of course be asked, Why did not my lords appear before the parliamentary committee and give evidence about the exercise of that responsibility? The task was left to subordinates, and if they failed to convince the committee about the excellence of the administration they are hardly to be blamed. Nor can it be said that Sir JOHN DONNELLY'S "observations" will counteract the committee's report. What is said bewilders instead of convinces. For instance, the infallibility of the department's system of bookkeeping is supposed to be demonstrated by the following analysis: "The committee are entirely mistaken in supposing that there is anything 'confusing' or 'confused' in the H subheads. H 3 provides for all the attendants, messengers and suchlike as are on the establishment, and for such cleaners, stores assistants, printers, labellers, &c., not on the establishment, as work directly under the museum and figures staff. H 5 provides for material whether it be in the form of cases, or for fitting up objects for exhibition, or for furniture, or for repairs of skylights, or for blinds, or for cleaning. H 7 provides for the material for heating, lighting, furnaces, hot-water apparatus, coal, gas, electric-light apparatus and the apparatus for precautions against fire, as hose, &c. H 6 provides for the cost of labour in fitting up and using this material; that is to say, for the wages of the works branch, the artisans, the labourers and the cleaners—other than those working directly under the museum staff—and for the Royal Engineers who act as a fire brigade and work at their several trades. No one in this category is on the establishment. These subheads no doubt 'overlap' in a certain sense. But in any system of account-keeping it would appear desirable to keep material and wages separate; at all events, the Science and Art Department has been required to do so, as also to keep separate what may be called the establishment subhead from the artisan and labour subhead." To go through a long series of "observations" in that style a man would require to be paid as liberally as if he were engaged on a catalogue of engraved portraits or one of photographs. We doubt if my lords will have the courage to read the defence with which they have prefixed their minute.

THE name of Canon VENABLES is likely to be known to most of our readers as one of the few surviving representatives of the old, learned race of clerical archæologists. His love of Gothic architecture has not interfered with his ministerial studies, and the list of his writings is evidence of his zeal and industry. His latest pamphlet is entitled "Thoughts at the Eventyde of Life concerning the Church of the Anglican Communion" (JARROLD & SONS). Among the suggestions contained in it are some of which notice will not be inapposite in these pages. One relates to the size of parsonages. The Canon says:—"How it came to pass that costly houses have been permitted to be erected or enlarged as vicarages and rectories, so that the person can no longer keep them in repair, puzzles those who are assured that nothing can be done without an architect whose plans have to be submitted to rural dean, archdeacon, and then the bishop." Canon VENABLES says it was suggested to him by an able architect that trouble to residents would be spared if all the rooms were on one floor. He proposes, therefore, to have one room for best kitchen and meal-room, the scullery or back kitchen being of a size where the servants' duties could be carried on. The parson's daughters would find life, he says, more enjoyable if they engaged in things domestic, like the Princesses of the Royal Family. "I believe," adds the Canon, "that the word 'lady' signified in Anglo-Saxon one who used to serve out provisions to the household and to the poor." It is also suggested that the reading and preaching in churches would be much improved if the architects did not design such high lecterns and arranged kneeling-boards in a way that would not cause pain to the clergymen. The want of receptacles for hats is said to be one of the causes which keep the laity from church, and another source of inconvenience is the neglect of cloaks and umbrellas. It is well that all obstacles to devotion should be announced, but the architects should not be held responsible for them. The large parsonages were adapted to the necessities of a time when clerical incomes allowed of ostentation, and the ladies of the house were not compelled to serve as servants. The tall lecterns are aids to effect and congregations admire them. As to the want of provision for hats, there are many devices which are cheap and efficacious, but the prejudice against them does not arise from the opposition of architects.

USHER HALL, if it should be constructed in Edinburgh, will have a strange history. It might have been devised for the promotion of discord. The Bill seeking for powers to purchase a site has excited much opposition. Contrary to the advice of Mr. WATERHOUSE, R.A., a dominant party of the Corporation fixed on Atholl Crescent as the most fitting place for the hall. That property belongs to the GEORGE HERIOT'S trust, a body that has existed from the time of the death of the famous goldsmith of JAMES I., a man whose generous bequests have rendered incalculable service to Edinburgh. The trustees allege that the Bill will completely destroy some of their rights and prejudice others, without any public necessity being apparent for the sacrifice. It is stated that the powers sought are in excess of what was originally proposed, apparently with the intention of securing the properties at less than their prospective value. There are also petitions from those who hold under the HERIOT trust, who deny that Edinburgh is in need of a municipal hall such as is proposed, and that the proposals of the Corporation to compulsorily acquire property merely to enable a legacy to be utilised is one without precedent, and that the Bill, while inflicting great hardship and pecuniary loss, is not required in the public interest. So far from the site proposed being an appropriate one (it is a mile and a half from the Council chambers), it has not, the petitioners believe, the general approval of the public, and has been adopted without due consideration, apparently to get rid of a question on which the promoters are themselves not entirely agreed.

SOUND is supposed to travel at the rate of 1,090 feet per second, and the calculation is believed to be applicable to a cry by the human voice as to the report of a cannon. Travellers and colonists can make themselves be distinctly heard at long distances, but audibility is only a question of power. Although the connection between the sounds emitted by a man can have a relation to distance, yet the voice has not been used as a measure of length. Apparently the first attempt to utilise cries was made by a surveying party attached to the Inter-Continental Railway Commission while at work at Costa Rica. In the report the following description of the process is given:—"For the survey we were obliged to extemporise an acoustic method, bandying yaups to and fro three to five times at each station by the watch second-hand, thereby ascertaining both direction and distance. Testing the method on open ground it never differed more than 6 per cent. from stadia measurements; the averages of the two methods would probably be about the same. Our experience gave us great confidence in it. Indeed, no other, no better device at least could be thought of if we were to make reasonable progress in such a country. Drums, gongs or the like thump-sounders might be an improvement on the voice and carry farther, but the voice has the advantage of being itself lighter to carry, an advantage very considerable. For long shots blank cartridges might be used, but we had none of these to spare." The experiment is interesting, but we suppose it would not be of much use if repeated in an inhabited country. But for pioneers so simple a method would possess many advantages.

MASTER-BUILDERS AND WORKMEN.

THE report of the Central Association of Master-Builders of London, which was presented at the annual meeting on Thursday in last week, is a document with which all classes should be acquainted. There are no men in the country of similar importance who are more reticent about their difficulties and grievances than builders. They have to endure many wrongs and their patience is continually tested, but they stoically accept evils which would compel other people to call on the public for sympathy. Nowadays it is impossible for any man to accomplish a builder's work unless he is endowed with unlimited passibility; he may endeavour to do more than his duty as an employer to his workpeople, but he must expect to receive ingratitude for his kindliest efforts. When, therefore, it is found that builders have abandoned their usual reserve and are indicating some of the difficulties with which they are hampered, the public can be assured that selfish considerations do not inspire the change. Builders can still be enduring, but the public should know that a crisis is approaching in which interests of a different kind are likely to be sacrificed.

It would, for example, be easy for builders and workmen to agree. Indeed, many of the latter cannot understand why differences between them arise. All that is needed is to adopt the system of various elected authorities who have set up a works department. Allow the men to do as little work as they please, and so long as they are liberally paid they are indifferent to what is required to complete the system. Allow high wages and do not insist on quantity or quality of work, there will be no objection to any charges which the builder will seek to obtain. Masters and men are supposed to have a common victim in the building owner, and while he settles the accounts presented to him it matters little whether he is to be considered as a friend or an enemy. That is the workman's political economy; he wishes to gain all he can with a little exertion of force, and he is indifferent to what may follow. From time to time his desire for money increases, and so does his repugnance to labour; but the builder is expected to be his agent in restoring equilibrium.

The public should understand what is involved in all disputes between builders and their workmen; it is simply a question of finance in which the public have more concern than those who carry out works. When it is found that the Central Association of Master Builders have to draw attention to the manner in which work is done it should be realised that the builders are endeavouring to save the public from imposition. A passage in the report will explain the new conditions of labour which have been fostered in a large measure by the practices of various works departments over which the public are supposed to have control. It is as follows:—

> One of the most serious matters for the consideration of the trade is the great increase in the cost of building, in consequence of the great decrease in the amount of work done by the workmen. Although wages have risen, the amount of work done for such wages has rapidly diminished; in fact, there seems to be a systematic determination, more particularly in some trades, that no workman shall do more than about half the amount of work that he is capable of doing, nor permit any other workman to do more. So long as a workman's remuneration is entirely independent of the amount of work he does (and a uniform rate of wages is insisted upon), there is, apparently, no prospect of preventing this state of things from developing even to a greater degree. On the other hand, if a workman's wages were dependent upon his industry and exertion, there would be an immediate revolution in the cost of building operations. The present system of almost universal day-work puts a premium upon laziness and inefficiency, and effectually strikes at all enterprise, energy and effort. It is reducing the British workman to a very low level, and developing a system of chronic dishonesty, which loses its odium from the fact that it has become general.

It is not necessary to be a master-builder in order to obtain evidence to corroborate the foregoing statement. There are few leaseholders or tenants who have to pay for repairs to their houses who do not possess acquaintance with the difference in the time which is now needed for simple operations and what sufficed some years ago. The humblest contractor in a back lane who employs a workman will have to admit the wilful decline in power which is becoming a characteristic of the building trades. Th masters are powerless against it. One of the reaso is that the men believe they have the public on their sid and unfortunately there is not much proof to the contrar People will not take the trouble to realise who are th principal sufferers by the "chronic dishonesty", which exhibited not only in an unfair measure of work, but, whe possible, in the inferior quality of the work. It might be struggle between slaveowners and slaves which is going o instead of an effort to make buildings become unnecessari costly in order to gratify a bestial sloth which is sure debase men into incorrigible rogues and vagabonds.

The high prices are in many cases an obstacle to buil ing, but the resources of the workmen are not exhausted them. They can lighten their easy labours by friend contests, in which the sufferers are the builders and tho who pay. One passage of the report will enlighten th public about the means which are adopted to del works:—

> The year has been characterised by a prevalence of palt and petty strikes against individual firms of builders. T definite agreement made with the trade unions, to submit disputes for consideration at a conference between employe and employed prior to any strike taking place, has been p sistently ignored by the workmen. In many instances t trade union officials have repudiated the action of th members, over whom they profess to have no control, althou it is to be observed that their control over their members see to be unlimited when they have a desire to exercise it. Sor of these difficulties have arisen in consequence of dispu between different trades as to which trade should do a certa class of work. Time was when the man who paid the wag decided what work should be done for the wages he paid, t this right is altogether ignored by the trade unions, who see to consider that the employer has no voice in the matter, a in the event of his refusal to endorse the particular views any trade union he is promptly struck against by the offend union.

When there is so much anarchy prevailing, the advice the Association concerning contract deeds is justifie Members are cautioned against signing any in which the is not an adequate extension of time admitted in t event of a strike or lock-out, and a proper arbitration clau in the event of dispute. The Association must think the future as well as of the present. It has to be admitt "that nothing is more serious in the outlook of the bui ing trade than the increasing scarcity of good mechanic But when the character of the workmen of to-day is co sidered, builders are to be excused if they hesitate to acc apprentices. There is no more effectual training for expert workman than is to be found in a builder's wo shops and in buildings which are in progress. But train up apprentices is like sowing dragons' teeth; it is the f course in the creation of an evil. It may also be doub whether modern youths care to go through the discipl of an apprenticeship. There is a notion abroad t not only a workman but a master builder or architect can be raised by a limited attendance at evening classes of a departmental or some other techn school. Moreover, the daytime can pass in idleness wh we fear, is fast becoming a hereditary weakness among so-called working-classes. If a lad has an additio quantity of that defect and more than the average cond he can imagine he is destined to be a craftsman, and t no great exertion will be able to supersede manufactu and be at least on a level with painters, sculptors architects. The causes which are operating against continuation of the old-fashioned English workmanship manifold, and in few trades are they so numerous a those connected with building.

When all the dangers are considered, and contingen should not be overlooked, the action of the Nati Association of Master Builders on Monday next ca be considered as unwarranted. The plasterers, who are delinquents, are sometimes treated as a class apart by o trades, but when an occasion arrives they can serve as representatives of all the building trades. If their dem were conceded, in a little time we should hear of necessity of additional privileges for other men, s apparently the claims of labour can be extended *infinitum*. Hitherto the philosophic temperament builders has prevented them from organising themse

into the power that is necessary when such dangers arrive as now prevail. But the success of their societies is a testimony that they can at length realise the futility of individual efforts. It is gratifying, therefore, to read in the report that "During the past year the process of federating the building trades' employers throughout the kingdom has been rapidly advanced, and that which for some time appeared to be only a pleasant theory has rapidly developed into an evident fact." It is only by organisation that builders' interests will be made secure, and that signifies public interests also.

AN OLYMPIAN MUSEUM.

IN the year 4 of its existence, or 1795 by ordinary reckoning, the first French Revolution was blown into space by the whiff of grapeshot which Citizen-General Buonaparte directed against the crowds on the steps of Saint-Roch in Paris. A few months before, while passions were raging and the guillotine was still in operation, an essay was read before the Institut National, a body that was holding meetings, reading papers and awarding prizes as if there were no mobs howling outside the building where the members sat like Roman senators. The essay was entitled, "A Project for the Encouragement of the Fine Arts and the Mechanical Arts," and suggested the foundation of "An Olympian Museum or Living School of the Fine Arts." The author was named Toussaint Bernard Emeric-David. It was through the recommendations in his paper that France owes the formation of the Musée du Luxembourg and the Conservatoire des Arts et Métiers, two institutions which might with advantage be introduced in this country.

It was a time of projects and revivals. The Terror had lost the greater part of its power, and men and women had grown weary of red nightcaps, which were supposed to be Phrygian, and of sabots. Fashion had demanded apparel which was not suggestive of the slums, and with the new clothes various other desires were created. David the painter was ready to demonstrate that art was elastic, and abandoning the sternness with which he played his part in the Convention up to the night when he proposed drinking hemlock with Robespierre, he designed robes which made women think they were Aspasias. Speculators who had concealed themselves in garrets ventured to come forth with plans which would take centuries to execute. Where so much was on a nebulous or colossal scale it was a relief to come across a man with a modest scheme for improvement which was adapted to the spirit of the age, and could be realised without excessive cost. We are, therefore, not surprised to find that the young advocate who fled from his province to Paris in order to escape from the death which awaited him for his *modérantisme* should have captivated the grave Institut and convinced a distracted Minister of the Interior. But although his scheme was realised to some extent, his countrymen are not aware that for the two institutions we have mentioned they are indebted to him.

Like his namesake the painter, Emeric-David believed there was little hope for the world, and especially for France, unless the people adopted Greek and Roman ways of life. When ladies were to be seen gyrating in ball-rooms as Minervas, Junos and Dianas in scanty flesh-coloured raiment, it appeared to him, as to others, that reformation was nigh. If Paris could so easily have rivals to the goddesses, why should there be any misgivings about creating artists like Phidias and Apelles? All that was necessary was to have similar conditions, and the great men would appear as certainly as an effect follows a law of nature. Emeric-David pointed out how in Athens the lowest artist was nourished at the public expense and occupied a distinguished place in the theatres. At his meals he bore a crown of olives on his head and was seated beside great captains, philosophers and magistrates. But if by any mischance he was neglectful of the proprieties, or if another artist was considered to be more able, then he was ejected from the national shelter for the illustrious. On the other hand, if an artist were extraordinarily able, like Polygnotus, he could be awarded a place not only in the Prytaneum of Athens, but in similar institutions elsewhere. He would, however, be a very foolish man if he attempted to take advantage of hospitality so general, and the bestowal was only an example of Athenian vanity. According to one interpreter, a domicile in the Prytaneum, with its corresponding advantages, was also awarded to mechanics, and a representative was selected once a year, on the feast of the Chalkeia. The reasoning of Emeric-David brought him, therefore, to a conviction of the necessity of a revival of the Athenian practice.

But at a time when a 20-franc piece was worth 5,300 francs in national assignats, and a ride in a hackney coach cost 6,000 francs in paper money, Emeric-David could not expect any minister, although he might be willing to pose as an Athenian, would build a palace for artists and craftsmen. But it was claimed as an advantage in favour of Emeric's project that it was not to add many livres to the national expenses. France had already provided the ways, if not the means. The Institut, he pointed out, consisted of able men who formed a sort of Areopagus that was worthy to be the judge as well as the model for artists. The task of selection, whether of men or of works, would therefore be gratuitous. Then in every second year there was a solemn exhibition of works of art, meaning the Salon exhibitions. But the best works in it had no chance of a continuous display, for from the "Muséum" or Louvre galleries the works of living artists were excluded. Every man wished to be considered famous in those days. The army was each year producing a batch of young heroes, and artists were eager to show how they could also be victorious. Accordingly, Emeric-David said he demanded the creation of a second Musée in which the chefs-d'œuvre of living artists were to be placed, one which would be consecrated to the reputation and glory of contemporaries, and which would make known to Frenchmen, strangers and the entire world the riches possessed by the country in having such children. From the works gathered in the new Musée a selection was to be made after the artists had died for the permanent collection in the Louvre or Panthéon of arts.

The Paris Prytaneum was therefore to be different to its Athenian predecessor. It was to contain works, and not artists. But the effect was expected to be no less beneficial to the State. In Emeric's time the Salon exhibitions were made up of a crowd of feeble attempts by young artists, with a few remarkable pictures. The masters who hesitated to send their works to the Salon would probably be attracted if they knew that the Government or a deputed body were to select works and to reward the men who produced them. Emeric's plan of obtaining paintings suggests that the spirit which at the present time has meddled with the privileges of the judges of the Cour de Cassation bore sway a hundred years ago. The Academicians might form an Areopagus and be models for artists to imitate in their daily life, but an equal number of outsiders must be combined with them when pictures had to be judged. This was proposed not from any apprehension of their competence or impartiality, but in order to avoid suspicion of their honesty.

Emeric-David insisted that all styles should be eligible for admission into the proposed galleries. Genre was to be as welcome as high art, sculpture and engraving were to have equal rights with painting. Those who imparted beauty to pottery and furniture, or who decorated the architecture of buildings, were to be honoured like the sculptor and the painter of history. The essential consideration was that whatever was to be admitted must be the best that was obtainable. For mediocrity no place was to be discovered. The new Musée was to be a battle-field for heroes alone. Thersites as well as Paris should be excluded from the contests.

It was expected that the Musée of works by living artists would recall the great competitions between those of Greece when the people became inspired by enthusiasm, which could not be otherwise than advantageous. Then, as Emeric-David pointed out, there was no prejudice in favour of schools, or system, or individuals. Timagoras carried off the prize from Panæus, the brother of Phidias; Zeuxis, who had inscribed on one of his paintings that however much his art might be envied, it could never be approached by another artist, had to succumb to Parrhasius. In his turn Parrhasius yielded his place to Timanthes, although he was so assured of his invincibility

that he insisted on men calling him the "Prince of Painters," and as tokens of his eminence wore a purple mantle, a bâton encrusted with gold and a golden crown. Parisians could offer similar instances of the uncertainty of fortune, for in the old University of the city there were constant contests, and the success of a professor depended on his ability to hold his own against all comers.

Among the advantages which could be anticipated from honouring living artists, Emeric-David counted much on the improvement in manufactures. France was then disposed to believe that military conquests formed a short road to riches, but he maintained it was the most industrious nation which was able to levy most on others. If France could not retain its pre-eminence in taste it would soon be without much commerce. He considered that the relations between the artist and the manufacturer should be multiplied, in order if possible that the versatile divinity Fashion might be captivated, or at least persuaded in her perpetual metamorphoses never to display want of taste.

Regarding expense, Emeric-David treated it as a subject which, under the circumstances, was hardly worth the consideration of a great nation. The number of works which would be deserving of a place in the Musée were likely to be few, for chefs-d'œuvre are not produced in abundance every year. The prices demanded by artists were sure to be modest, for the gaining of a place in such a collection as was sought would bring advantages which would compensate for the sacrifice of money. It is hard to find art treated in an ultra commercial spirit, and the State becoming an advertisement agent and insisting on excessive fees; but, in spite of the progress which the democracy always claims, the system still prevails. Every year works are acquired in France by the Government at prices far below those obtainable in the market, but when an offer is made an artist dare not decline it. If Emeric-David had not recognised economy as a factor, it is possible the Musée du Luxembourg and the Conservatoire des Arts et Métiers would not exist among the institutions of Paris.

SYSTEMS OF DISTRIBUTING AND GENERATING ELECTRICITY.

By F. J. Warden-Stevens.

(*Continued from page* 126.)

Steam-engines.

STEAM-ENGINES for use in electricity supply works may be divided into two classes, high and low speed; it must, however, be admitted that the former type is being adopted in most cases in this country, at any rate for small units of plant.

The continuous current dynamo is essentially a high-speed machine, and this being the case, if a slow-speed engine is used gearing must be placed between the engine and dynamo. Rope-gearing is necessary for large powers, and a long drive is required. This necessitates an increased expense for buildings. It will be seen that in large towns, at any rate, it is inexpedient to increase the area of the works, as land is expensive, and in any case the building will cost more if gearing is necessary.

Again, gearing means loss of energy, and consequently a larger engine for a given dynamo than would otherwise be necessary. Thus it is evident that as low cost is a great consideration in electricity supply works it is advisable to couple the dynamo direct to the engine. Now this may be done in two ways—by having a slow-speed engine and a slow speed dynamo coupled to it, or by adopting a high speed engine and coupling a dynamo running at a nominal speed. In the first case, the dynamo is constructed to suit the engine, and in the second, the engine to suit the dynamo. High-speed vertical engines have been improved very much within the last few years, and if two coupled sets (one high speed and the other slow) of the best class and of similar size are compared, the consumption of steam per electrical horse-power will be very little different in the two cases. The space taken up, however, by the slow-speed combination is considerably more than with the high speed.

Where space is of no consequence other questio decide the type, such as price, cost of maintenance, atten ance required and other considerations which must balanced in each case by the engineer.

Engines, whether vertical or horizontal, high or lo speed, are further divided into simple, compound a triple expansion, according to the arrangement or numb of cylinders. It must be remembered that in any engine it desirable to keep down the difference of temperature betwe the steam entering and leaving the engine to as low a lin as possible, as otherwise the steam on entering the cylind condenses, coming into contact with the lower temperatu of the cylinder walls, owing to the expanded, and therefo lower temperature steam having just left the cylinder. F this reason it is found that a simple engine is not economi if used with high-pressure steam. High-pressure steam much more efficient than low-pressure, as the high efficiency of any steam-engine is proportional to t difference of temperature between the admission a exhaust. Pressures from 120 to 180 lbs. per squa inch are now usually adopted, because with the pressures boilers are easily constructed and f economy is also attained. A simple engine with stea at 180 lbs. pressure would be extremely uneconomical, a for this reason steam is expanded in two or three cylind successively. In the first the pressure falls a portion o of the total, enters the next cylinder, which is of cou larger to take the larger bulk of expanded steam, t expands still further again in the case of a three-cylind engine.

Simple engines are used for pressures below 50 to 60 l per square inch, compound between 60 and 120 lbs., tri between 120 and 180 lbs., and quadruple expansion engi for higher pressures than this. If a condenser is used effect is to add about 14 lbs. to the boiler pressure; *i.e.* 60 lbs. non-condensing a simple engine should be used, for 60 lbs. condensing the virtual pressure would be 74 ll and this is well within the limits for compound worki The 14 lbs. pressure is added because this is the norm pressure of the air which is removed by condensing t steam and forming a vacuum.

The effect of condensing in an engine is consideral There is more benefit to be obtained by condensing w low-steam pressure than with high, as the possible efficie is roughly proportional to the range of temperature. Wo ing between 114 and 14 lbs. per square inch (atmosphi pressure) 60 degs. C. range of temperature is obtained, between 14 lbs. and 1 lb. per square inch (almost a vacu 60 degs. C. range of temperature is also obtained, theoretically the efficiency is double by working with a c denser. If, however, there is a range of 30 degs. C. m condensing, which is 40 lbs. per square inch, treble efficiency (theoretically) is obtained by adopting condens It will then be seen that, taking into account the waste air pumps and auxiliary plant necessary for cooling wa &c., that it will not pay to work condensing with very l pressures as well as it will for low. It is often the prac to adopt triple expansion non-condensing engines and w at 190 lbs per square inch pressure rather than compou engines—condensing and 150 lbs. per square inch—l economy being often quite as good. On the other h the old beam engines worked with 10 lbs. per square i and always were fitted with condensers.

The question of governing of engines is a very impo one, especially in cases where the load on the engines v vary considerably. The variations in load must be me that the pressure on the dynamos will be constant or va in a controllable manner. Dynamos are usually arra to be driven at a constant speed under all loads, and th very desirable, and in fact almost essential, with alterni current systems of supply, in order that the "freque (number of alternations per second) may be kept const

The power given out by the engines must therefo altered without varying the speed, and this must be ac plished either by altering the pressure of the steam, w is known as "throttle" governing, or altering the qua of steam admitted at each stroke, known as "expans governing.

In some works there are no governors on the eng the regulation being effected by hand, using the t valve of the engine as a throttle valve. In t

ase, or where there is a throttle governor, steam admitted for a fixed portion and expands for the emainder of the stroke, the governing being effected by ecreasing the pressure of the steam. The amount of xpansion allowed to the steam being fixed, steam is shut ff at the most economical point, which is about half stroke i compound engines. It follows, then, that a throttle overned engine cannot do more than about half the work iat would be possible if steam could, when required, be dmitted for the whole or nearly the whole stroke. It is irther evident that the engine will work most economically hen there is no throttling, that is, at full load. Now ectric-lighting engines can never be run at full load for iore than, say, an hour or so in the twenty-four, as extra mps may be put on, so it is necessary to run the engine : an uneconomical load for a large portion of the time.

These disadvantages have been met to some extent by lopting the other method, viz. the power of the engine is ried by altering the ratio of expansion of the steam. In ese engines the ranges of expansion is from ·1 to ·85 of e full stroke. Now the best expansion being say about stroke with compound engines, the engine will run most onomically at $\frac{\cdot 5}{\cdot 85}$ of full load, which is about the average und in practice. The economy will be much worse at gher or lower loads, but that is not of much importance the engine will usually run at about ·6 of full load.

Two engines of equal cylinder sizes may be compared follows :—

	Throttle Governing.	Expansion Governing.
Full load, $\frac{1}{8}$ of max.	50	85
Highest economy	Full load	·6 of full load
Average load	·5 to ·7 of full load	·5 to ·7 of full load

The expansion engine can thus be smaller for the same aximum power, and therefore there are less radiation loss, d it can usually be run with greater economy of steam an the throttle-governed engine. For these reasons the pansion-governed engine is making headway in electricity rks. The throttle-governing, however, gives better results h very low loads, and for this reason combination angements are coming into use. One class of vertical gine is being adopted in which the cut-off in the high-ssure cylinder is varied by hand, within limits of ·3 to ; of full load, and the governing is accomplished by a ottle valve. The attendant has to see that the expansion altered so that the pressure in the steam chest is never ry much less than that in the steam pipes, and so a good -round economy is obtained, and in some cases this is ected automatically. A little throttling of the steam is od, especially at low loads, as the steam is slightly super-ated (dried) by this, and there is less loss from condensa-n when the steam is entering the cylinder.

The general arrangement of a governor is that a ball or sc of metal is revolved by the engine either directly or by aring ; this is so arranged that if the speed is increased e extra centrifugal force makes it fly out at an angle inst the force or gravity. The movement causes the ves to be altered so that less steam is admitted either by ering the position of the throttle valve or by altering the int of steam cut off in the engine cylinder, according to e method of governing adopted. By this means, the vernor being set, one speed may be maintained within tain limits, usually from 3 to 4 per cent.

Coming to the actual types of governors, there is very le that need be said here. They all act on the centri-al principle, and the only radical point of variation is the ckness of cut-off of the steam. It is advisable to have harp cut-off, although the benefit of this is often exag-ated. A slow cut-off means throttling of the steam.

The sensitiveness of a governor need not be very high electric lighting if there is not a large power demand for tors, or other cause for very rapid variations in the loads the plant, but in view of the extension of electric tram-rs, it is well to be prepared to meet such conditions at a r period, so it is advisable to have the best governors.

The Corliss gear has found considerable favour owing to short steam ports and quick cut-off; but its use has ally been confined to slow-speed engines, and there is no ibt that the results obtained with this gear are very good. ently, however, a single-acting high-speed engine has been introduced, which is fitted with Corliss valves, and is an improvement in many respects upon the slow-speed engines at present using this gear. The results from this engine are very satisfactory, and it will no doubt take its place among the best engines for electrical work.

There is no doubt that the attendance and oil required by the enclosed high-speed engines of the best types are much less than for the slow-speed engines. They are started quickly, and are used to a large extent because of these qualities, which are suitable for electricity supply work.

Where a very small space is available, or where great freedom from vibration is necessary, such as where plant has to be placed on upper floors, where injunctions have been obtained or trouble is likely to arise for nuisance, it is advisable to consider the advantages of steam turbines.

The steam turbine is coming into use to a considerable extent in works where low first cost and space is important, and they are certainly to be recommended on the ground of compactness, freedom from vibration and cheapness. They require no foundations, only to be placed (not bolted) on rubber blocks.

The chief feature of the steam turbine is the high speed, and the fact that the motion is entirely rotary. All steam turbines act on similar principles to water turbines; but it must be remembered that the speed for economical working must be very much higher. Steam turbines are inefficient if run non-condensing; in fact, even more so than steam-engines, especially if low-pressure steam is used. Steam turbines can be made to govern extremely well, and are therefore very suitable for electrical work. The steam consumption is often rather high, and if the steam consumption is lessened, clearances between the moving parts have to be reduced, often making the machine unreliable.

(*To be continued.*)

MR. RUSKIN AT HOME.

A CORRESPONDENT of the *Leeds Mercury* gives the following account of a visit to Mr. Ruskin at Coniston:—

Brantwood is a fitting place for seclusion and repose and for the rest, well earned, at the end of a life long and strenuous, far beyond the ordinary. Its windows overlook "the shining levels of the lake," itself the image of tranquillity and peace. Coniston Lake is just such a mere as might have witnessed the Passing of Arthur, and have been the scene of the mystic vision of the gleaming sword. At the upper end it is dominated by the hills that buttress Coniston Old Man, and by the great mass of the Old Man itself. Gradually, towards the south, the hill eminences approach the level of the lake, until, if you have the imagination of a Tennyson, you may conceive that somewhere beyond the invisible southern shore may be the "happy valley of Avilion"—

> Deep-meadow'd, happy, fair with orchard lawns
> And bowery hollows crown'd with summer sea.

From Yorkshire and from South Lancashire Coniston is not so accessible either by road or railway as are many of the lake-side towns. It is a pretty stiff journey by railway, for you have to round the promontory of Barrow Head, and skirt the sea-shore up to Duddon Point, before you can connect with the single line which runs from Foxhill into the Coniston Valley. So on the occasion of a recent visit to Mr. Ruskin's home it was much later in the day than we had imagined it would be before we reached our destination at the Waterhead Hotel, which stands in pleasant grounds at the northern end of the lake. We were due by special invitation at Brantwood at 5.30 P.M., and it was fully five o'clock before we were deposited at the comical little station at Coniston. After a wash and a brush down, followed by light refreshment, by the advice of the landlord, we hurried down to the boat-landing in the hotel grounds, with the view of taking a boat and proceeding up the lake to Mr. Ruskin's residence. There were plenty of boats moored to the jetty, but no boatman was to be seen, so we determined to dispense with assistance (there were two of us bent on the same pilgrimage), and to use the oars ourselves. We were not experts, but with a little trouble we soon found ourselves nearly opposite to Brantwood; but so far as we could see there was no landing, so we moored our skiff to an iron fencing that ran out into the lake and walked ashore. Crossing a rich meadow, we entered a lane which took us almost in a straight line to Brantwood. The evening was fine and the atmosphere clear, so we had beautiful views of the lake, of the hills and of Coniston itself. The latter is probably the most Swiss-like village to be found anywhere in England.

From Brantwood the houses seemed dotted about anyhow on the shelving rocks and protuberances, and without any order. They were in lovely detachment and disconnection, which added rather than took away from their picturesqueness, and we could have gazed for long on so fair a scene had time permitted.

We required no introduction to Brantwood. We had before had the pleasure of meeting Mr. and Mrs. Severn, and it was to their kindness we were indebted for an invitation to go over the house and its art treasures. In the temporary absence of Mrs. Severn, Miss Severn, a beautiful and charming young lady, discharged the duties of hostess; but before we had finished tea, Mrs. Severn returned and kindly took us in hand herself, and, without any ceremony, began to show us the treasures of the house. We should mention that Mr. Severn was absent on one of his sketching excursions in the south of England. As for pictures, we began with Turner's in the drawing-room and ended with them in Mr. Ruskin's bedroom. We should have liked to pencil down their names and descriptions, but we had no permission to do this. In addition to masterpieces by Turner, there was a Titian and several old Cromes and William Hunts. The principal Turners were in Mr. Ruskin's bedroom, a little cabinet-like place in the northern wing of the building. As the great master lies in his bed—which is an ordinary cottage make with no embellishment about it—he can see Turners at his side, at his feet and all around him. Perhaps there is no similar room in England in which so much of value in the shape of pictures is hung. As daylight dawns day by day the light-beams reveal to him those splendid art dreams, the glory and beauty of which he has made famous over all the Continent. In the same room, in a fitting "case," are Mr. Ruskin's principal literary treasures, illuminated missals and black-letter Bibles. A specimen of the latter was shown to us by Mrs. Severn. The lettering and illumination had all been done by hand, and the exact regularity of the letters and lines showed how painstaking the artist must have been. Corrected passages in the margin showed that mistakes in the translations had occurred. These, by the use of ornamental scrolls and designs, had been given a pictorial value and added to the beauty of the text. The book was in an admirable state of preservation, and was regarded as one of the most precious gems of the collection—a pretty extensive one, notwithstanding the price which must have been paid for every separate specimen included in it. In passing along the corridors one could not but notice, hung on the walls, large photographs of Burne-Jones's *Legend of the Briar Rose*. There are two studios at Brantwood, the old and the new, and into both of these we were shown. There were unfinished drawings and pictures by Mr. Severn and Mr. Ruskin. Those by the latter must remain as he has left them, for he will put no further touches to them now. It is some few years since the writer of "Modern Painters" took a brush in hand, or, indeed, has made any contribution either to art or literature. One by one we visited almost every room in this delightful house; even the bedrooms of the Masters Severn, in which were hung drawings and paintings of the various fishes taken from the lake below. At Brantwood the humane domesticities, it was plain to see, had not been neglected for high art. There is quite a homely and human trace everywhere, as there is bound to be in homes where juvenility, curbed or uncurbed, is in evidence.

During our inspection of his treasures, Mr. Ruskin had been for a brief walk in the charming grounds which surround his treasure-house. He had only just returned as we came downstairs from the studios, and was taking a needed rest in his study. It seemed almost sacrilege to disturb him, but, as we were kindly offered an introduction, it was not in human nature to refuse to avail ourselves of it. We felt nervous on the question of intruding ourselves on his privacy, for we knew that his health was in a somewhat enfeebled condition, and that for some time past he had refused audience to old and dear friends. To have left Brantwood, however, without seeing him would have been a great disappointment, and so, half willingly, half reluctantly, we allowed ourselves to be ushered into his room. Mr. Ruskin is taller than the ordinary, and as he was seated in a low and cosy armchair, he had naturally to assume a bent and reclining position. Mrs. Severn kindly introduced us, and Mr. Ruskin was cordial without being in any way effusive. We noticed "the kind and searching glance" of the deep grey eyes under their heavy, cave-like brows, as if of inquiry and request, as well as of observation. Having apologised for a needless intrusion, and a pardonable curiosity, in the best and politest language we could command, we soon found ourselves in a pleasant conversation, in which Mr. Ruskin took his share, falteringly, it must be admitted, on the merits of an artist whose earlier work Mr. Ruskin had spoken of in high terms of admiration. Alluding to the most recent specimen of his genius, we soon discovered that Mr. Ruskin's memory was able to carry him back over a term of many years, for he pointed out that his earlier work, of which he gave an instance, was much superior to the later example to which we had drawn attention. "This," he said, "is undoubtedly good," but, shaking his head, "I like the —— better."

After some further conversation, in which we could see was an effort on the part of the master to in any way share made our leave-takings, but not before we had been able realise how this man, of whom half the world has been rec talking, is mentally contemplating the expiry of the remna days still left to him. The noble face had on it an expre of a solemn and almost austere serenity. That the years told upon him it is needless to say. If the sense of pow gone, the intellectual lines are there and the kindly out Mr. Ruskin still possesses a wonderful wealth of hair. four years ago it retained much of its original colour, but it is for the most part iron grey. Of late his beard has allowed to grow in all its luxuriance of silvery whiteness. a remarkable and venerable face, and one long to be rer bered for its expression of power, of conquest and of One sees at a glance how readily in the days bygone su man could solve many problems that are mysteries t general mind, for there is intuitive insight, and great pow observation and perception of analogy shown clearly in piercing eyes, which, having once seen, one can never fo One who knows Mr. Ruskin well has assured us that his expression has changed greatly in recent years. His fea have now an almost spiritual whiteness which was not only a few years ago. Something of the same change noticed in the case of the father of Charlotte Brontë, an read in Tennyson how King Arthur went "ghost-like" doom.

We learnt some facts about Mr. Ruskin from Mrs. Se and the villagers which have not as yet, so far as we know, their way into print. Mr. Ruskin when ill is a difficult pa to deal with. He never had much faith in medicine. when laid up with a severe attack of internal inflammatio asked the doctor not what would be the best, but what w be the worst for him. The answer was, "Beef." Immedi the contradictory and self-willed patient hungered for a sli cold roast beef. There was none in the house, but it had got somehow, and after some trouble a slice was obtained an eating-house. It was brought to Mr. Ruskin wrapped paper. The master enjoyed his supper thoroughly, fortunately the rash act was not followed by any serious sequences.

At present Mr. Ruskin's life is from day to day an changing routine. From his room he has ample views of lake and scenery round about. He gets but little exercise, most of his time is spent at his study window gazing ont splendid panorama which only such a coign of vantage afford. Up till the last few years it was his custom to tak walks daily, morning and afternoon, and in the evening up the time by playing chess and whist with the family. relaxations are now "few and far between." At one tir was an industrious gardener, and was allotted a plot of which was won from the bare hill-side, to till himself. were shown through this Ruskinian parterre and the fl and herbs which he had planted were pointed out to us. were told that of flowers the red rose is his favourite, a the summer time its scent is never missing from his room

On the lake-side Mr. Ruskin is everywhere spoken "The Professor." He has always been a kindly and le patron of such local institutions as flourish in these pa flower shows, Sunday schools and the like. Some time a used to take great interest in the village social gathe We gathered that on one occasion a performer, having to keep his appointment with the villagers at one of recurring entertainments, and having sent no apology doing, was soundly trounced in a letter which was read the platform, and which was couched in the choicest Rusk He took the deepest interest in the welfare of the village s and was known personally to numbers of the children. of these received letters from his pen on matters interest their little minds, and no doubt these precious scripts been treasured by them.

It is well known, of course, that Mr. Ruskin's charities been unbounded. He gave away nearly the whole of a fortune, and there is but one instance on record of his taken any money to his lawyer for investment. That, Severn assured us, was a sum of some thousands of p which he received on the sale of a Meissonier. He had b this painting originally for 1,000*l.*, and sold it for 6,000*l.* one was more surprised than the family lawyer whe Ruskin made this departure in his personal econo "Hallelujah," he is reported to have ejaculated, "there is news at last."

Ruskinese has never been written by any other ma Ruskin. There are elements in his style which remind y a distant kind of way of Jeremy Taylor, but these part no relation to the whole. His frank egotism, which offen one, is in him, and in him only, delightful. Ruskin h imagination like a subtle crystal, in whose cool depths yo

e innumerable fair things. He has a memory that seizes ion and retains whatever it has read, heard or seen that is of iport and value. This enables him to gather intellectual ealth from every possible source. He is saturated with a eling of child-joy and child-wonder concerning everything at his eyes see and his ears hear. The most trivial sight or und may be magnified in his brain into a hundred differing ctures and harmonies, compact of beauty, wonder, awe, verence, love; the great faculties of your most intellectual spirits e everywhere discoverable in his writings. Coupled with these, ere is an intense love of simple, unspoilt nature, which makes him te railways and all innovators and innovation. The scaffold ork and artificial devices of a so-called civilisation are utterly tasteful to him. How many times he must have uttered athema on the little pleasure steamer that puffs up and down e lake beneath his windows. "Gondola" it is called, as if in ny of his own beloved Venice. It would be a mistake to edit Mr. Ruskin at all times with a sound judgment, for, deed, he is a most capricious spirit, and is not at all averse contradicting himself when occasion serves. He has been th eccentric and foolish many a time and oft. Nature has ade Ruskin what he is, and no one could attain to his style l manner of handling great themes of art and economics by y manner of artifice or any amount of study. It is that art ich is beyond the teaching of the schools, though the schools n and have informed it with wealth of illustration and beauty analogy. His sentences are all clear cut and jewel-like in ir brilliancy, just as the wondrous hilt of that sword which maiden of the hills wove for Arthur. Like that "gleaming racle" it too will pass away with the great man to whom it s given with such deftness and dexterity to use it for the orming and edifying of more than one generation of not unling or unsympathetic catechumens.

RCHÆOLOGY OF THE NAPLES DISTRICT.

HE British Consul in his last report says:—A very interesting mosaic was discovered a few hundred yards oute the wall of Pompeii last summer, and has been purchased the Italian Government for the Naples Museum. It repreits a conclave of seven philosophers amongst a group of ns. The principal figure is seated and reading from a pyrus roll. In the distance is the Areopagus of Athens. e mosaic is of the finest execution, and the marble cubes of ich it is composed are of bright and varied colours. A her portion of the town wall has also been cleared and nd to be of pre-Roman period, being constructed in the an style, and at the south-western point of the city a temple ich was in course of construction has also been discovered.

In extending their cemetery the municipality of Caserta e come upon the remains of a classical necropolis, the tombs which are quite likely to yield important objects. The bs of Capua and Suessola only a few miles off have yielded at treasures to excavators for many years past, so it is much be hoped that those of Caserta may do the same, in which e the municipality will have made a first-rate bargain. ere is no doubt that enormous wealth lies hidden beneath soil of South Italy, concealed in the tombs of the various es which have from time immemorial inhabited the region. e difficulty is where to look for them. The town of Nola is iated in the province of Caserta, and it was here that the est vases of the Italo-Greek period were painted in the fifth tury B.C. What wonder then if we find them in the adjait localities? In making a new railway in the neighbourod of Avellino, another classical necropolis has been accitally disclosed in the past year, and if excavations are conued there they may quite well be productive of satisfactory ults. The Government regulations as to excavations are ublesome and apt to deter speculators, as they add considery to the expense of their operations. Naturally these finds in the nature of "treasure trove," and though the Governnt allows the finder to keep them for himself, it prohibits export of any important specimens, thus greatly narrowing owner's market. Our regulations at home in the matter of asure trove were not found to conduce to the convenience he gold-miners in Wales.

Naples deserves more attention than it receives from lers in decorative old Italian and French furniture. London lers appear annually and purchase Greek and Roman iquities and first-class objects of the fourteenth and fifteenthtury periods, but the trade in antique furniture proper is not risk as it ought to be, and our dealers might do worse than their attention to it. In the time of the French occupaat the beginning of the century there must have been a k trade from France, to judge from the quantity of uis XVI. and Empire furniture which is constantly coming the market and being sold at very moderate prices. There also in the old palaces many specimens of English furni, and recently some satinwood writing-tables and bookcases turned up, which were sent to London and are reported to have realised fabulous prices. The market is undoubtedly a cheap one and much neglected by our dealers. Dutchmen purchase a good deal for the markets of The Hague and Amsterdam, and though the supply is not very large it is very constant, as owing to the poverty of the old families and the distribution of estates, many large properties are being broken up and their treasures dispersed. These fall into the hands of the local dealers at absurdly low prices and they are glad to part with them at a moderate profit. The antiquity shops are fullest in January and February in expectation of the influx of strangers in the months of March and April, at which time of year dealers from other countries also make their appearance. The summer months are the best for obtaining low prices, as the unsold goods of the past season must be disposed of to make room for other stock which is being varnished up and got ready for next season. A shrewd buyer acting for a syndicate of London dealers might do good business here, as freights are low and steamers to London frequent. The most remunerative plan is to buy the goods before they are done up and have them restored at home, as this minimises risk of damage in transit.

ST. PATRICK'S CATHEDRAL, DUBLIN.

A PAPER was read at the meeting of the Royal Society of Antiquaries of Ireland on Tuesday by Mr. Thomas Drew, R.H.A., entitled "A Further Note on the Surroundings of St. Patrick's de Insula, Dublin. Restoration of the North Close, 1899. The Possibility of Recovery of the Ancient Well of St. Patrick." He said the whole of the lands known as the Liberty of St. Sepulchre, near Dublin, were in 1190 possessed by the Archbishop of Dublin, and on them was the church of St. Patrick de Insula. The boundaries of the respective plots have been strictly maintained for seven centuries. They are still definable on the south, east and west sides of the cathedral in existing leaseholds, and were so on the north side until 1890. The Liberty of St. Patrick's, as created by Comyn, was walled and fortified, and dignitaries' houses were built. They were, however, not maintained. The exempt jurisdiction and property of the Dean and Chapter in the street traversing the ancient cemetery, and known to us as St. Patrick's Close, did not lapse until comparatively few years ago, and has for that interval vested in the Corporation of Dublin. It is now sought, under a Bill promoted last session in Parliament by Lords Ardilaun and Iveagh and Mr. James Talbot Power, to establish an open park or city garden on the north side of the cathedral. It is proposed by it, inter alia, to restore to the cathedral its verge assigned by its founder, Archbishop Comyn, in 1190, held by it for successive centuries, and essential as a foreground to the dignity of this ancient and stately church, which has been rescued, maintained and restored to the citizens of Dublin in the past thirty years by private munificence. The veritable ancient well of St. Patrick, where baptisms were traditionally said to have been performed by the saint himself, was, on the authority of Archbishop Ussher, who saw it in his time, enclosed in houses standing on the north Close. Antiquaries of reverent instinct and ecclesiologists are hereby warned of a coming chance of recovery of this famous and sacrosanct well, on the restoration of the ground sometime desecrated as a public street, and within the area of the houses marked on the map as in possession of Henry Hunt, or Rotton, in 1750, removed by the Wide Streets Commission in 1824. Bearing in mind that the inevitable accumulation process in city bounds has in seven centuries raised the surface of the ground 6 feet, and perhaps more, above the ancient ground level, a hope may be entertained by the pious that the well of St. Patrick is not lost for ever. It was seen by Ussher in Queen Elizabeth's day, and Malton, writing in 1790, took upon himself to say that it was still to be found under the hall of the house nearest depicted in his view of the west end of St. Patrick's. That it may be but covered up, and may be brought again to light is not impossible.

The address was illustrated by limelight views.

Sir John Fowler, C.E., has left personal estate which has been valued at 153,649*l.* net, and the whole of his estate at 179,329*l.* gross. He bequeathed in trust for sale thirty-four oil-paintings and thirty-eight water-colour drawings, including eleven by Edwin Landseer, eleven by J. M. W. Turner, "The Order of Release" by Millais, "The Smoker" and "The Halberdiers" by Meissonier, "Hampstead Heath in 1818" by J. Linnell, sen., works by David Cox and Holman Hunt, "The Pedlar" by Sir David Wilkie, "The Slave Market at Cairo" by Müller, four drawings by W. Hunt, and paintings by Phillips, Faed, Bonington, Nasmyth, Rosa Bonheur, Greuze and Frère.

NOTES AND COMMENTS.

M. PASCAL is not sparing of labour over the design for the memorial of CHARLES GARNIER which is to be erected at the Paris Opera House. Already he has prepared a great many drawings. They may be divided into two classes. In one the bust of the late architect by CARPEAUX would be the principal element, and the architectural features would have to be worked up to a scale that would make them appear to be in harmony with the building. In the second class sculptured figures are introduced, and a monument essentially different to the former would be necessary. M. PASCAL is acting with great impartiality, and appears to be willing to repress his own work and to give pre-eminence to sculpture if a more suitable memorial is the result. He has sought inspiration by repeated trials, and it will be hard if, after so much toil, he is not satisfied with the result. Finance will have much to do with the determination of the character of the work. The committee has succeeded in obtaining nearly 2,000*l.* The Société Centrale des Architectes has contributed 1,200*l.* of that sum, and nearly 600*l.* was obtained from the performance of "La Bourgade" at the Opera House. The subscriptions from the non-professional admirers of CHARLES GARNIER have come in rather slowly, but the sum obtained ought to be enough to provide a satisfactory memorial.

THE parasol was originally a sign of dignity, a protection interposed between the sun and a monarch or chief. The use made of it is represented in the Assyrian sculptures. The usage passed to Greece, where the parasol appears to have been employed as a symbol of a divinity. The "Scirophorion" might be called a festival of parasols. It was not against the sun's rays, but to shield himself from an English downpour that JONAH HANWAY introduced the parasol in this country in the form of a substantial umbrella. But all ancient and modern parasols will be surpassed if the project of Madame GIVERNE should be carried out. That lady proposes that one should be constructed for the Paris Exhibition of 1900 which would shelter an area of 15,386 square mètres. The central upright would be a metallic column or tower, 330 feet high. The cover would have a diameter of 500 feet, and would be formed of coloured glass. Beneath the cover there would be four stages, like those of the Eiffel Tower, having small theatres, concert-rooms, cafés, &c. A fourth stage outside the covering would revolve, and enable visitors to enjoy a view of the exterior parts of the whole exhibition. The stages would be reached by staircases and lifts. During rain the shelter afforded by the parasol would be appreciated. The project suggests the consideration which is given to the discovery of an extra attraction for the approaching international exhibition. The Eiffel Tower was the principal cause of the success of the exhibition of 1889, and a rival to it is desired. The proposed parasol would be only a third of the height of the Eiffel Tower, but it would have the advantage of affording a vast shelter. Whether it would be as attractive is a problem for the committee of the exhibition. That it could be constructed is certain.

THE question of water-supply for London is so complicated that few men who cannot be classed with experts care to consider it. The numerous inquiries have darkened the subject rather than cleared it. Dr. ARTHUR SHADWELL, in a volume called "London Water Supply" (LONGMANS, GREEN & Co.), published this week, has undertaken "to give the general reader a broad and comprehensive grasp of the question, which can only be understood in the light of its history, so as to enable him to judge the true bearing of the present situation and the various points at issue." To narrate the history of the attempts to grapple with the difficulty, which becomes more onerous every year, would need several volumes. A sight of the Blue Books on the subject is enough to frighten a writer. But Dr SHADWELL has introduced sufficient to allow an intelligent reader to understand the extent of the danger which sooner or later must be coped with. London is, however, not the only place which is threatened with risks. We have several times pointed out that the various catchment basins should be defin and that not one of them should be appropria without the authority of the Government departm charged with the responsibility required for that d Liverpool, Manchester, Birmingham, have secured supp which are far in excess of their present needs, and, as fa can be calculated, beyond their future needs. The sour would have served for a metropolitan supply. Other to have acted in a similar spirit. Successive Governme appear to have been indifferent to the necessities of country, if considered as a whole. Dr. SHADWELL ha similar theory. He says, "The true solution is to m the sources of water supply, their distribution and protecti a department of Government." He proposes that medical side of the Local Government Board and Board of Agriculture should for that purpose be combi into a ministry of public health, one of whose functi would be care of the sources of water supply. This, says, "would solve the problem for London and all Engl at the same time," and in that conclusion we agree.

THE new railway which is in course of formation Vesuvius is under the direction of Mr. FELL, a son of nonagenarian who constructed the original railway c Mont Cenis, which was the first of the Italian mount railways, and has since the opening of the tunnel b transferred to the Righi. It is risky to undertake impro ments in the neighbourhood of Naples, for Mr. FELL a his colleagues have been threatened with personal viole by the guides, who think that their trade will be seriou interfered with by the line. The vast addition to number of visitors will, instead of injuring the guic probably increase their profits and make their work far arduous. The question, however, arises whether the can be considered as a permanent way. Vesuvius of years has been exceptionally active, as if resenting much familiarity with its terrors. The carriage-way co not be used owing to the débris which blocked it, and observatory and other new buildings were threatened w destruction. A railway under such conditions is exposed many dangers.

THE late Mr. WILLIAM ROBERTS, of Manchester, not gain a renown by his architectural works, but he surpassed all the modern English architects by munificence of his bequests. He has left for pu purposes no less than 23,850*l.* Only 4,000*l.* is to utilised for building. That sum is to be applied for erection of a Unitarian chapel at Brook's Bar, Manches The large sum of 4,500*l.* is to be expended on a bro statue of Mr. GLADSTONE for Manchester. The o bequests include 2,000*l.* to the Hulme Grammar Sch 1,200*l.* for a lifeboat on the Welsh coast, to be called "William Roberts," 1,050*l.* to the Manchester Infirm 1,000*l.* each to the Old Trafford Deaf and Dumb Schd the Welsh Theological College, Bala, the Unitarian H Missionary College, Manchester, and the Northern Cour Hospital for Incurables. There are other benefacti varying in amounts from 100*l.* to 500*l.* Mr. ROBERTS a bachelor, and had no near relatives.

IN preparation for the international exhibition t Eiffel Tower is to be repainted. The operations h commenced. The time required for giving one coa paint to the structure is about three months, and the w would not be accomplished without the labour of f painters. For each coat over fifty tons of paint are u The second coat will not be laid until the beginning of year.

SOME GOTHIC CATHEDRALS.

LAST evening a long and interesting lecture, illustrated by upwards of 100 lantern slides, was given by Mr. T. Francis Bumpus (author of "Ecclesiologia Germanica," &c.), on Gothic Cathedrals," before the Guild for Young Men and Women attached to New College Chapel, N.W.

In some prefatory remarks the lecturer observed that although the majority of our great ecclesiastical edifices lay at a considerable distance from the Metropolis, it was not absolutely necessary to quit it in order to study the progress of pointed architecture in England, for they had, so to speak, Gothic at their doors: Norman in the chapel in the White Tower and St. Bartholomew's, Smithfield; Transition in the Round of the Temple Church; Early English in the same structure's choir, St. Saviour's, Southwark, and the chapel of Lambeth Palace; later Early English in Westminster Abbey; Decorated in St. Etheldreda's, Ely Place, and the nave of Austin Friars; Perpendicular in St. Helen's, Bishopsgate, St. Andrew's Undershaft, and St. Margaret's, Westminster; debased Gothic in St. Catherine Cree and the chapels of Lincoln's Inn and the Charterhouse; in the wonderful group of churches by Wren, and in numerous beautiful and costly modern ones in the suburbs, forming a perfect history of English ecclesiastical art from its earliest to its latest epochs. No one fond of church architecture then need repine that his or her lot was cast in London.

That evening, however, it was Mr. Bumpus's pleasurable duty to take them further afield, not only to the beautiful cathedrals and churches of their own country, but to those of France and Germany. It behoved him, therefore, to enter upon his subject with the least possible circumlocution, seeing the amount of ground waiting to be traversed. After a few words respecting the remains of pre-Norman Conquest architecture, a view of the simple, solemn Norman chapel of St. John in the White Tower was presented. Although severely plain, as befitting the chapel of a fortress, this was mentioned as one of the most complete and well-designed buildings of its kind. The exterior of Southwell Cathedral was next given as illustrative of a bold Anglo-Romanesque exterior. This was followed by an interior view of the same cathedral, which, the lecturer remarked, was verily one of wonders, with its massive round-arched nave, whose ensemble had been much improved by the removal of its flat roof; its graceful Decorated screen at the entrance of the First Pointed choir; and its chapter-house, where, if they should visit this quaint, out-of-the-way, but ideal cathedral city, they must give special attention to the delicacy and richness of the foliaged ornament.

Southwell was followed by a view of the nave of Durham. Whether we regarded it from its grand situation on an eminence overlooking the Wear, or from what Dr. Johnson so appropriately called "the rocky solidity and indeterminate duration" of its heavy circular arches and cyclopean columns, some zigzagged and others channelled, it is impossible not to feel that at Durham we stand in a mighty presence. The lecturer had a tolerably large acquaintance with the Romanesque work of Northern Europe, but knew of no one as striking the beholder in the same manner as the peculiarly solemn majesty of this mighty fabric that "looks down upon the Wear." If they carried the eye beyond the choir-screen and the pinnacles of the Neville shrine, forming one of the most glorious reredoses in England, they would perceive a lovely addition to the cathedral in the shape of the Chapel of the Nine Altars, which seemed to realise to the full the exquisite grace which the Early English style had reached towards the middle of the thirteenth century.

Durham Cathedral was the first in England to be opened from end to end by the removal of its screen.

Unfortunately these alterations were effected before such matters were properly understood, viz. in 1847, and the magnificent oaken screen on which stood the organ—one of the most superb monuments of the taste and piety of Bishop Cosin—was sacrificed and replaced by nothing. At the same time, the fine font canopy of the same epoch was cast aside as lumber, probably because it was not "Gothic," but a better taste having of late years arisen, it has happily been reinstated. About three-and-twenty years ago the present choir screen was erected. But it is needlessly heavy, and at a fraction of the cost one of Late Perpendicular character in oak might have been erected. The result would have been far more satisfactory, and it would have harmonised with the woodwork of Cosin's choral fittings. Until the time just mentioned Durham Cathedral was almost entirely destitute of stained-glass, but this defect had been remedied, and the great eastern triplet, the Joseph window in the north-eastern transept, the Perpendicular one in the great transept and that above the west door—a fine specimen of Late Decorated, representing the Radix Jesse—illustrate some of the best work of Clayton & Bell. The choir of Norwich Cathedral, although it did not give them an adequate idea of the cyclopean Anglo-Norman work in that church, was selected as being the one which had retained its original plan—*i.e.* with its procession path and radiating chapels—more completely than that of any other in England. The exceedingly clever manner in which the Perpendicular pentagonal clerestory had been superimposed upon the Norman triforium was specially pointed out.

The nave of St. David's Cathedral and the choir of Oxford Cathedral were then thrown on the sheet as illustrative of Anglo-Norman architecture in its later and richer phase. A fine view of the choir of Peterborough was next given, the lecturer remarking that when the Perpendicular "New Building" was substituted for the old procession path, the original form of the apse was left comparatively undisturbed.

After a brief sketch of the various alterations effected in the ritual arrangements at Peterborough, the lecturer passed on to the nave of Gloucester Cathedral, whose huge cylindrical columns, of a type found also at Tewkesbury and in a less grandiose form at Malvern, were but rarely met with on the Continent in Romanesque buildings of this style, though in Belgium they were used during the Middle Pointed periods not unfrequently, as at Mechlin, Liège, Brussels and elsewhere.

In showing the choir of Chichester the lecturer observed that although many English cathedrals are loftier, larger and more stately, its characteristic features were rather those of grace and richness, instancing the two bays of Transitional Norman work in the retro-choir, which, with its pillars composed of four slender shafts detached at some distance from a cylinder, and all with Corinthianising capitals, exhibited the greatest delicacy and refinement. The exterior of Chichester was also commented upon as a fine specimen of pyramidal grace. From 1845 to 1859 this cathedral had at the head of its chapter a man of great ecclesiological taste—Dean Chandler.

To Dean Chandler the Pointed revival owes a peculiar debt of gratitude. When circumstances led the Ecclesiological Society to quit Cambridge and seek London under a new name, the good Dean—as rector of All Souls, Langham Place—held out the right hand of fellowship to the new arrivals. He was the founder of St. Andrew's, Wells Street, of which church the Rev. Benjamin Webb, co-founder of the Cambridge Camden or Ecclesiological Society, subsequently became incumbent, and he made possible the Society's model church, All Saints, Margaret Street, also carved out of his parish. The architect Dean Chandler called in for Chichester was Richard Carpenter, one of the earliest, fastest and most distinguished friends of the Gothic revival, but of whose works in London we possessed but one specimen—the calm, scholarly church of St. Mary Magdalene, Munster Square. Mr. Bumpus observed that he did not wish to burden their minds with examples of Anglo-Romanesque or Norman, whichever they liked to call it, but he could not quit this epoch of our architecture without recommending them to visit and study such noble specimens as the naves of Ely, Rochester, Hereford, Romsey, Christchurch, Waltham and Dunstable; the transepts of Winchester; the crypts of Worcester, Canterbury, Lastingham and Repton; the churches of Stewkley; St. Peter's, Northampton; Caistor; St. Bartholomew's, Smithfield; Porchester; Barfreston, and Castle Rising.

When they went to France they would be perplexed by the various types of Romanesque architecture presented by that country, as that of Provence, that of Auvergne, that of Anjou, and so on. He would, however, recommend for their special study the churches of a most delightful district, viz. that around Caen, as being particularly rich in specimens of the Norman style, and one of which he would now proceed to show them—the church of St. Etienne, or Abbaye-aux-Hommes, at Caen. He was also glad to be able to present them with a view of a small but typical Rhenish Romanesque church—that of Boppart. He would remind them that Germany had several schools of Romanesque. There was that of Westphalia, very rugged and inartistic, but valuable from the fact that so many of its churches had remained so little impaired by later alterations and accretions; that of Saxony, resembling in many respects that of the South of Europe; and, richest and grandest of all, that of the provinces neighbouring to the Rhine. Nowhere in Europe did the round-arched style have so long a life as here. It would take too long to enumerate the various causes which led the people of this part of Germany to cling to it with such tenacity. They were passionately attached to it, and were it not that the dates of such great structures as Münster, Neuss, the Apostles and St. Cunibert's at Cologne, Bonn, Andernach, Sinzig, Boppart, Limburg, Gelnhausen, Bamberg, Mayence, Worms and Speyer had been pretty exactly ascertained, we should, looking at their external ensembles, assign them to 1150 or thereabouts, whereas many of them were fifty and some a hundred years younger than that date; for while Salisbury, Worcester, Lincoln, Wells and Westminster were rising in England, and Chartres, Amiens, Rheims, Troyes and a host of great Pointed churches in France, here were the Germans still deep in the round-arched style, though intermixing it, as in the example now before them, with the Pointed.

All of a sudden, towards the middle of the thirteenth

century, the Germans abandoned this style, which they were about to bring to such a pitch of excellence, to embrace the complete Gothic one, which they never properly understood, and in which they made sad mistakes. Yet many of these complete Gothic churches, although unworthy of imitation, abound in fine detail, and the study of these buildings (which have little or nothing in common with those of France and England) was a very absorbing one.

In the view of Boppart Church the lecturer drew the special attention of his hearers to the unusual height of the nave aisles, which contributed not a little to the shortness of its appearance. This was due to the presence of the Männerchor, or gallery for men (literally men's choir), a feature which, corresponding to our triforium, was made much of by the Rhenish architects in churches whose floor-space was limited. Two views of Mayence Cathedral and one of Worms were next shown as remarkably noble instances of the national style, and upon the study of which he could not insist too strongly. Too many people who went to Germany came away with their ideas of that country's architecture derived from Cologne and Strasburg Cathedrals. But to study German church architecture they must leave the beaten tracks. Limburg-on-the Lahn, Bamberg, Naumburg (with its two wonderful rood-screens) and Gelnhausen must be visited as specimens of the national style; and Marburg, Oppenheim, Trèves and Altenburg for the complete Gothic. Penetrating into Westphalia, they would find along the courses of the Lippe and the Weser those extraordinary architectural puzzles, the cathedrals of Münster and Paderborn and the Minster at Herford. Here they would find, in cities like Münster and Soëst, town churches with aisles as high as the nave, and, in some cases, deep lantern-like choirs, all very awe-inspiring and imposing. In Prussia and Pomerania, the brick architecture of the churches in Brandenburg and Lübeck, with their magnificent old furniture; and in Saxony, Hildesheim, Goslar, Hecklingen and Quedlinburg, with their basilican Romanesque churches, all would afford unending field for study and research. Views of St. Michael's Church, Hildesheim, the Dom at Brunswick and the group of steeples in the centre of Tournai Cathedral were exhibited in illustration of the foregoing remarks, the last named, although in Belgium, being distinctly German.

The Pointed arch, it was observed, had made its appearance in the southern parts of France nearly a century before its adoption in the northern provinces. Here we first meet with it in the cathedral of Noyon and in the abbey of St. Denis, whose apse and western façade were the only remains of the building commenced in 1144 by Suger, the intervening and upper portions after a fire having been rebuilt in the complete Gothic style of the age of St. Louis. St. Denis—the Westminster Abbey of France—had suffered terribly at the Revolution. Some well-meant, but sadly mistaken, restorations were undertaken to repair the damage during the reigns of Napoleon I. and the restored Bourbons; but it would be unfair to compare them with the scholarly works carried out during the Second Empire under Lassus and Viollet-le-Duc. Mr. Bumpus specially commended to the attention of his hearers a line of beautiful and very Early Pointed churches along the Oise, between Creil and Paris.

Another very early instance of the employment of the Pointed arch in France was the Abbey of Pontigny, of which simple Cistercian building Mr. Bumpus presented his audience with an external and an internal view. The connection of Pontigny with Canterbury, affording as it had done an asylum to three of our archbishops, led the way to the exhibition of a view of the glorious choir of that cathedral. This was one of the many beautiful specimens of the Transition from the round-arched to the Pointed style, erected during the reign of Henry II., a long and peaceful one, which was conducive to much friendly intercourse between that Sovereign's dominions in France and our own country. Of another and comparatively little-known example of Transition, the choir of Ripon Cathedral was given in illustration, the lecturer especially directing attention to the first three bays on the north side.

Much fine Transitional work was to be found in such ruined abbeys of the North as Furness, Fountains, Kirkstall, Buildwas, Kelso and Jedburgh. Glastonbury Abbey furnished another splendid example, as did St. Cross at Winchester, Brinkburn Priory in Northumberland, and Billingham Church, Durham, where the piers, formed of four slender shafts clustered round a core with bell-shaped capitals and square abaci, resembled those he had shown them at Ripon. And lastly he would mention the grand western transept of Peterborough Cathedral, which formed so appropriate a link between that "pride of Northern Romanesque," the nave, and that "majestick porch of columel work," the triple-arched Early English façade, concerning whose welfare so acrimonious a controversy had lately raged.

Such appendages as this gigantic western transept or narthex at Peterborough were rare in England, but of frequent occurrence in Germany, St. Cunibert's and the Apostles' Church at Cologne presenting it on an unusually grand scale

To quit London in search of Transitional work was not requisite, for a remarkably fine example existed of it in the round part of the Temple Church.

The latter part of Henry II.'s reign saw the Early English style established in all its purity, as evidenced in the nave of Wells Cathedral—a type of Early English peculiar to south-west England—Llandaff Cathedral, the abbey at Glastonbury, St. Candida at Whitchurch, in Dorset; Slymbridge Church, Gloucestershire, and Cheriton Church, in the Gower district of Wales, affording similar examples. With regard to the inverted arches, introduced for safety when the ponderous tower was raised in the fourteenth century, the lecturer took the opportunity of remarking that some people thought them a great eyesore. He, however, happened to think the reverse, and that a really noble object had been created out of necessity. Had such precautions been adopted at Chichester we might now have been in possession of the old thirteenth century spire. Similar arches, but on a lighter scale, had been introduced at Canterbury and Salisbury, and with very picturesque results.

As regards its plan, Wells might be cited as a type cathedral of the old foundation; its entourages were singularly fine, while in beauty of situation it was equalled perhaps only by Salisbury, three views of which, as our Early English cathedral of the Lancet period *par excellence*, were shown in succession to Wells. The chapterhouse attached to this cathedral was dwelt upon at some length. In style it was more developed than that of the main fabric, but it desiderated that boldness which is so fine a feature of the somewhat earlier one of Westminster. Mr. Clutton, who had restored this chapter-house at Salisbury, and Mr. Burges, who had monographed the curious sculptured scenes from Bible history within the spandrels of the wall arcades, had each made a special study of this graceful piece of later Early English work.

They had been shown England's typical First Pointed cathedral, now that of France would be presented to them in several views of the majestic one of Chartres. After some remarks in comparison of the situations of English and French cathedrals in general, and of Salisbury and Chartres in particular, Mr. Bumpus proceeded to give a brief sketch of the latter, the most perfect and least altered great French work of the period 1194-1260, showing no evidence anywhere of a change from the first scheme during the long progress of the work, the whole of which was carried out exactly on the lines dictated at first, leaving nothing for a subsequent age to accomplish. Much of the work had, to eyes accustomed to our delicate First Pointed work, a somewhat rugged look, but this might be attributable to haste, the men of Chartres being unwilling to see their cathedral in ruins a day longer than was necessary. The views shown of this Parthenon of France comprised the west front, with its marvellous triple doorways of the twelfth century and its strangely dissimilar steeples; the interior, where the complex character of the nave piers was pointed out; and the northern transeptal porch with its wealth of imagery. Its glorious store of coeval painted glass was likewise descanted upon.

Returning to our own shores, a remarkably fine piece of Early English detail was shown in the elevation of the western side of the south transept at York, attention being specially directed to the manner in which the Early Pointed work had been disturbed when the great Middle Pointed nave was erected. This was followed by a view of the choir of Worcester, formerly one of the coldest and least effective of English cathedral interiors, but which, within the last quarter of a century, had been made to assume an appearance of great beauty. It abounded in the most exquisite detail; its elevation upon successive flights of steps was highly imposing, and the lecturer could not forbear remarking that he had rarely been so struck with any cathedral interior on first entering as he was with that of Worcester. There were, no doubt, points in the restoration of this church that were open to grave criticism, such as the removal of the beautiful old post Gothic choir stalls and pulpit canopy during the redistribution of the choral fittings between 1867 and 1874, but the general effect now was really magnificent and would be materially enhanced when the clerestory of the choir had received its complement of stained-glass. The beauty of the eastern transept at Worcester having been especially descanted upon, Mr. Bumpus proceeded to show some more Early English work as exemplified in the presbytery of Ely Cathedral, which was, he opined, the ne plus ultra of English refinement; in Lincoln Cathedral, whose choir and eastern pair of transepts, the work of St. Hugh, were little later than the nave of Wells, though of a totally different type; in the nave of the same church, the wide spacing of whose pier arches deprived it of the poetry so characteristic of Salisbury and Wells; and in the choir of Southwell. Attention having been directed to the numerous beautiful specimens of Early English work enshrined in the west front of Dunstable Priory

the Nine Altars of Durham, the choir of Rochester Cathedral, and the churches of St. Mary-le-Wigford, Lincoln; Skelton Church, York; Stone, near Dartford; Ashbourne, Derby; Ketton, Rutland; and Chetwode, Bucks, the lecturer remarked that in Germany the Lancet period, or First Pointed style could never be said to have had a separate existence on a large scale, the cathedral of Limburg-on-the-Lahn approaching nearest to our ideal; but it appeared now and again with considerable purity in portions of buildings and details, in illustration of which the north aisle of Magdeburg Cathedral was shown.

Mr. Bumpus then took his hearers to France and showed them some of the great churches that had been rising there contemporaneously with those of our own country, whose main features he had striven to render them familiar with. Notre-Dame at Paris, Laon, Rouen, Amiens, Beauvais, Le Mans, Bourges and Rheims were then severally thrown on the sheet and comments made upon their salient features.

Metz Cathedral was also exhibited, but the lecturer advised his audience to visit this remarkable church either before those he had just passed in review, or after the ecclesiastical edifices of Germany and the Rhine. Those who loved ancient painted-glass would be gratified at Metz, where the principal face of each transept was a perfect wall of vitreous decoration. And if they began with the top row of figures in the north transept window and continued down it, and then proceeded in the same way with the opposite one, they would be able to form a tolerably correct idea of the progress and decline of the art of glass-painting from the fourteenth to the sixteenth centuries.

(To be continued.)

SOCIETY OF ARCHITECTS.

THE fourth ordinary meeting of the Society of Architects was held on February 23. Mr. G. Gard Pye (member of Council) having taken the chair, the minutes of the previous meeting were read, confirmed and signed as correct.

The following nominations were then announced for membership:—F. G. M. Chancellor, Walter Cook, R. F. Fulford, G. P. Smedley.

The following members were elected:—E. C. Clare, Chelmsford; W. A. Scott, Drogheda.

The following paper by Mr. F. Scruby was read:—

Lincrusta-Walton.

It gives me much pleasure this evening to have the opportunity of speaking a few words to you upon so interesting a subject as mural decoration, as exemplified by the process known as Lincrusta-Walton, as I am myself a great admirer of the ancient mural decorations of this and other countries, having spent many years abroad at very great expense in connection therewith.

Now, gentlemen, I have to take you back a very considerable period of time, in fact to draw your attention to the days of the early Egyptians, and I may say there is scarcely one of the branches of decorative art which has not been at different times applied to the beautifying of wall surfaces. The earliest known method of decorating a wall was with sculptured marble or stone of some kind. The best proofs of this sort of thing are to be seen on the spot. Perhaps some of you have been to Egypt and seen for yourselves. We have to go back a period of 2,000 years, as this kind of decoration is so ancient. Tombs were always decorated; these sculptures were usually painted over or picked out in a great variety of colours with much care. Very seldom was the ground left the natural colour of the stone worked. Generally some scenes in war were depicted and scenes of every-day life, and the use of this marble lining was to cover stone walls. One of the oldest buildings in the world, the "Temple of the Sphinx" among the Gizeh Pyramids, is built of great blocks of granite and lined with slabs of most beautiful semi-transparent African alabaster.

Coming down to a later period, the Romans also veneered their walls with richly coloured marbles. The Egyptians, Assyrians and Sasanians of Persia, as well as the Moslems, used glazed and stamped bricks, which they brought to great perfection for ornamental uses. Now there is another peculiar kind of decoration which I am sorry to inform you is absolutely lost—there are many things which have been lost to us to-day; but dealing particularly with art there is a kind of material which we cannot discover. The Romans knew it and the Greeks knew it; it was a hard stucco, the colour of ivory, and would polish like marble, standing the most severe tests of the weather. The early Greek temples were covered with this material. We thus see that this which we know of to-day and admire very much is not at all new, it is, in fact, very ancient indeed—I mean the idea of decorating one's house inside and out. We now come to an age when stamped leather was in use, viz. the sixteenth and seventeenth centuries. Skins of goats and calves were employed, but that was a very expensive manner of decoration; these skins were pressed out with metal dies, one in relief and the other sunk, and were also painted in various brilliant colours. Italy and Spain were the important centres of this manufacture. There was a century before this period, viz. the fifteenth, a wall-hanging made of canvas to imitate tapestry. Wall-papers did not come into common use until the eighteenth century, and then they were printed on small square pieces of hand-made paper, difficult to hang, disfigured by various joints, somewhat costly and unsightly; for this reason a long time elapsed before wall-paper superseded such dignified decoration as carved wood panelling, painting, tapestry, painted cloth and stamped leather. It was very expensive, and was chosen only by those who could afford it. Now, gentlemen, I am going to ask your attention to a small historical matter. About the year 1857 a gentleman named Mr. Frederick Walton made the discovery that linseed oil exposed to the atmosphere oxidised. Now that was a very simple thing to discover, you will say; but it was a very important discovery. Often little things lead to great results; it was to be so in this case. By simply observing in this instance, a patch of linseed oil became quite firm. While he experimented, and being keen and alert and observing, he made the discovery that he was able to produce something; but of course he did not have all his own way at the outset, but that is only, of course, the history of all inventors. By the use of what Ruskin calls the "most durable oil" he thereby gave us the linoleum of to-day, which is in itself a great achievement, and we are indebted to him for it. He thereupon founded the Staines Linoleum Company, which has paid 20 per cent. for over twenty years.

One day, in the year 1878, whilst watching the machinery he noticed an impression had been made on the linoleum. You see, again, here his powers of observation: he noticed this indentation in the linoleum was caused by a screw which had got loose in some part of the machinery. A trifle like that, no doubt, some of the workmen had seen, but they had let it go by; but this little incident had struck the mind of a keen observing man. Thus he gives us Lincrusta-Walton. Now, gentlemen, this was the origin of Lincrusta-Walton. A very simple thing you say, but, like our friend Columbus and the egg, it is a very simple thing when it is done. Now this man, using his alertness and powers of observation in the first instance, not only makes money out of it himself, but enables other people to do likewise, and through his keenness, originality of thought and determination, we are indebted for the possession of a process which enables us to beautify our homes and decorate the public buildings of the country with all the ancient designs of the most beautiful kind ever worked in leather, thus immortalising art by handing these examples down to posterity. One very great advantage in using this material, Lincrusta-Walton, is that most of the warlike insects leave it alone. Now, one of the worst we know anything about is the "white ant," he cannot fill his belly with it, so he leaves it alone; beetles and worms find nothing in it, so Lincrusta-Walton is not only beautiful, but it is endurable. It is also a positive proof against dampness, as many can testify, which is a very important thing. As a further indication to you, I may tell you it is used in a large number of public buildings, including the Queen's Hall, Langham Hall, the Tivoli Palace of Varieties of Leeds, the Cambridge Palace of Varieties, London, the Coburg Hotel, Grosvenor Square, London, the Tivoli Palace of Varieties, Manchester, the Masley Hotel, Manchester, the Belfast and Northern Counties Railway Hotel, Belfast, and all the chief flats and mansions in Kensington; in a very large number of hotels, and by most of the railway companies in the United Kingdom, as well as some of the chief liners to Australia and the United States, and the new baths at Harrogate, where there is plenty of moisture. It is eminently suited for hospitals and public institutions. Now that is in itself a test of the usefulness of the material. Now I will give you a few points of the difficulties of the manufacture of Lincrusta-Walton. In the first instance, the material used gave considerable trouble, and though it was the same as linoleum, yet it was quite a failure. An ordinary man would have stopped there, he would in fact have thrown it up in disgust. Although everything seemed to point to failure, after working nearly two years he produced a composition of wood fibre, oxidised oil and gum, and the result is that to-day that material in combination is still used in the manufacture of Lincrusta-Walton. This was not his only difficulty; after having proved to his own satisfaction that this material would do, the next difficulty was the machinery. There was no machinery suitable in existence; he had therefore another task. He first tried the use of impressed composition for his rollers; this and other materials were experimented with, but owing to the excessive high pressure, steel rollers had to be used, which, after being used so long, were useless, and new rollers had to take their places. In addition to this, 50,000*l.* was spent before the company was ready for business, and but for the security and monopoly that a patent gives, this capital would not have been subscribed at

all, nor the enterprise carried out. Now this is a great and praiseworthy achievement. It has been said that the man who causes two blades of grass to grow where only one blade had grown before, may lay claim to greatness. This Mr. Frederick Walton accomplished.

Such instances as these should inspire us to fresh exertion, and encourage us to follow up an original idea, however simple it may appear to be. A man who introduces a thing that combines the useful with the beautiful is always wanted, and will always command attention; and when we consider that Lincrusta-Walton does this in reproducing all the most beautiful Italian, Spanish and other choice designs at a figure that places it within the reach of thousands, it is a matter for congratulation.

The many fine examples of wood-carving of the fifteenth and sixteenth centuries that still exist give us some idea of the wealth of the country in this branch of art. The rich oak-work of England was no exception to the universal application of coloured decoration, and nearly every screen, roof and choir-stall was covered with minute painting in gold and colours. The modern idea that oak should be unpainted was unknown to our Mediæval forefathers, and they, as a rule, preferred a simple coating of paint of different colours to the natural tint of the oak. In most cases, however, the woodwork was not left with its uniform ground of paint, but delicate and graceful patterns were added on to the main lines of the work. Many of the Norfolk screens still have much of their painted ornament in good preservation, and richness of carving is to be seen on the church roofs of both Norfolk and Suffolk. This wood-carving is usually of very high artistic merit, combining delicacy of detail with strength of decorative effect in a way that has never been surpassed by the Mediæval artists of any country of the Continent. Norfolk, Suffolk, Devonshire and other counties are rich in elaborate chancel-screens carved with delicate foliage. The tracery which fills in the upper part of these screens is of wonderful beauty and executed with most minute finish.

In the sixteenth and seventeenth centuries there was very little good wood-carving produced. The oak-panelling and other fittings of the Elizabethan and Jacobean periods were largely enriched with surface relief, coarse in execution, but often decorative in effect. Towards the end of the seventeenth century a very realistic style of wood-carving came into use, in which there was great technical skill, but little real artistic feeling. Between the years 1648 and 1721 Grinling Gibbons and his pupils produced the most elaborate works of this class, such as wreaths, scrolls and friezes carved in high relief, or in the round, with fruit and flowers modelled and carved with wonderful skill. These clever groups of foliage and fruit were carved in pear or lime wood, and fastened on to the surface of wall panels, mantelpieces and other wood fittings. The stalls and screens in St. Paul's Cathedral are some of Gibbons's best work, and a great deal of his realistic carving still exists at Oxford, in Trinity College, at Trinity College, Cambridge, at Chatsworth, Pepworth, and in many of the great country houses of that time. Since then wood-carving has not taken an important position among the lesser arts of the country.

Now, gentlemen, in looking back to these times it is a matter of great gratification at the present that all these beautiful designs in wood, which have been produced by great labour and skill, are capable of being reproduced in Lincrusta-Walton, no matter how intricate or apparently difficult. It must here be observed that Lincrusta-Walton is solid in relief, and the designs cannot be obliterated or the artistic effect marred by workmen.

In fixing Lincrusta-Walton to a new wall time must be given sufficiently long to permit the exudation of lime to pass off by exposure to the atmosphere.

The most artistic samples of Lincrusta-Walton in this country, either for walls or ceilings, are to be found only at the offices of Mr. F. Fordham Scruby, 11 Berners Street, Oxford Street, W., who has there stocked reproductions of the celebrated Cordova, Italian and Spanish leathers, as well as splendid examples of wood panellings in Lincrusta-Walton. Mr. Scruby's experience in this material covers a period of over nineteen years, and he has always been at the service of those who desire to consult him.

In conclusion, I am of the opinion that the Society of Architects are the natural custodians of the ductile and the utile, and it is to them that the country is indebted for the growing magnificence of our public and other buildings and the internal comforts they contain.

I thank you, gentlemen, for your kind attention.

Mr. J. R. Manning proposed a vote of thanks to Mr. Scruby for his interesting paper. But he must differ about some of the uses to which it was put—for instance, the imitation of carved woodwork. He could not agree with reproducing in their houses the beautiful oak screens they found in Devonshire and other counties, in Lincrusta. That Lincrusta-Walton had a use and a proper use he could quite agree. It was very effective for ceiling decoration. He had seen some very fine specimens of what could be done in commercial warehouses in Hamburg. Red bricks were used in the construction of the exterior walls, and all of those walls which were in the main roads were faced with glazed bricks, relieved by simple mouldings. The effect was extremely good, and the decorations were in a material which would stand the wear and tear of time.

Mr. William Cooper, in seconding the vote of thanks, said he could not help thinking that Mr. Walton was the pioneer for relief decorations in such a form as could be used at the present day. They all had to consider the matter of cost, and when the consideration of cost the question arose, What should they use for pleasing decoration? And he must say, from his own experience in the use of Lincrusta-Walton that it stood well, matched well, and was impervious to damp. With regard to imitation of woodwork, that, of course, architects did not like.

Mr. Ellis Marsland said that he had come there for instruction, and he did not see that the subject was open to much discussion. He thought that while Lincrusta-Walton was kept to legitimate decoration nothing could be said against it. It was merely like the former leather decoration, only instead of leather being stamped it was the material which Mr. Walton had invented. He would urge them not to attempt to imitate oak-work, as such imitation was very distasteful to architects.

The Chairman thought the paper they had listened to had been very interesting. There were a good number of places in London, however, where the material could be utilised to good effect, such as music-halls, public-houses, &c. It had been his lot to have a good deal to do in the alteration of public-houses and in the erection of new ones, and he had introduced this class of Lincrusta-Walton, and he must say that it had given every satisfaction to his clients. It was a good wearing material, could be easily cleaned and seemed to last a long time.

The Chairman then put the vote of thanks to the meeting, coupling with Mr. Scruby the name of Mr. Norris, who had read the paper on Mr. Scruby's behalf, and the vote was carried unanimously.

Mr. F. Scruby, in reply, was very pleased to hear the remarks which had been made, and thanked them very much for the vote of thanks. With regard to the Lincrusta panels, they all knew that there was a sham, but several gentlemen had seemed to take to the material, and he mentioned that some fine specimens could be seen in the Holborn Restaurant and elsewhere. The general public had wanted that material, and they were obliged to comply with that demand.

Mr. Norris, who also replied to the vote of thanks, said that many remarks had been made against imitation. He would remind them that so long ago as 5,000 years the ancients had faced their walls with marble veneer, and as they had started so early with imitation it was rather late at the present time to put it down. The ancients knew of nothing better than imitation, and he considered that a huge granite wall was certainly improved by a facing of marble veneer. Imitation he thought was necessary, and the ancients started the very thing they were objecting to. Lincrusta-Walton was an imitation, but was far more beautiful than marble veneer.

The proceedings then concluded.

COLOUR DECORATION.*

(*Concluded from last week.*)

IN a work on the art of the Japanese stencil-cutter, by Mr. Andrew Tuer, F.S.A., he says:—"The artist-workman takes some half-dozen sheets of tough paper made of mulberry fibre (*Broussonetia papyrifera*), prepared with the juice of persimmon and waterproofed with a hard-drying oil. On the top he places the artist's design, drawn with ink. The sheets firmly secured, he begins cutting with a long thin knife, which he pushes before him in the same way as a copperplate engraver at home uses the burin. Slowly and accurately the keen blade cuts through the little pile of paper, following the curves of the design. Where there are punctured holes or dots the knife is superseded by a fine punch, for if pins were used a bur would be formed and the design would not print clean and sharp. When the cutting-out is finished, two of the sheets are dampened so that they may expand and, what is of equal importance, contract equally in drying. One is laid down flat and covered with adhesive material. The threads are then one by one put in position, the ends sticking on to the margins. The second stencil is accurately laid over the first by means of upright pins placed in the 'register' holes already mentioned, the two paper plates are brought exactly together and the thread securely imprisoned. The joining of the two plates enclosing the threads is so absolutely perfect that a strong glass fails to disclose any signs of overlapping or unevenness. That anyone

* A paper by Mr. Cole A. Adams, read at the last meeting of the Architectural Association.

t a Japanese could execute such difficult work as this is nply impossible."

When the stencil-cutter has got through his first pile, he ts a stencilled impression on the top of the next as a guide in u of the original drawing which now has no independent stence, and he will continue cutting out the same design til he has a number sufficient for his purpose. From its ture, especially when the design is delicate and finely cut, a per stencil-plate cannot last very long. Many of the amples in our collection have been so much service that they nnot again be used. Now the Japanese employ stencil- ates for the decoration of their textile fabrics and produce ost artistic effects; whether they have any like method in use r wall or ceiling decoration I do not know, but I venture to row out a suggestion for adapting the principle employed by em, and applying it in a modified sense to our use.

Let the design to be employed in repetition be drawn on irly stout cartridge paper, and it may be designed without ıy care for the "ties" which it should be the object to dis- ense with, so that the plate shall leave the stencil brush ıished. Then give the paper a coating each side of patent ıotting, and with three or more similarly prepared blank ieets secured together at all available points, place on a sheet plate-glass, cut out the parts through the several sheets with sharp knife. Then when you have cut out the pattern, ɔerate the sheets and insert between two of them a network very fine wire, which may be made taut by attaching it to a ame (a trifle larger than the paper stencil-plate) of stout wire. he two plates being exactly adjusted should then be pasted ɔgether, and when dry given another coat of knotting. It ıay be objected that the wire which takes the place of the ties" will be objectionable and will show in the colour, but ith skill in manipulation it may be made, if you will, to become art of the design. I do not think it will be any detriment, nd at all events the plan will admit of a much wider, artistic nd more extensive use of stencilling. By having on your alette several mixings of the colour of varying tints, and two or ıore stencil brushes in use, it is very easy to blend the colours f the stencilling in executing it, and to remove the harsh ıechanical appearance one so often sees. By a series of ılates effects can be produced on the same principle as wall- ɔapers or printing in colours is done, and much of the objection o stencilling will vanish by adopting this method of the apanese.

The difficulties that beset a decorative artist are very great, ınd he must be ever studying so as to store his brain and keep ıbreast of the times. I think a student can hardly do better han commence his studies of decoration of the different styles vith copying from the decoration of savage tribes, of which he British Museum and most museums contain a goodly collection. I advise this as affording illustrations of what the ıntutored man does in ornament and colour, and there is a narked likeness in the early efforts of different nations or ribes; lines, circles, dots, zigzags, herring-bone, and the employment of the primaries of colour.

Then the styles should be taken, commencing with the Egyptian as the earliest. Let me suggest a visit to the Crystal Palace at Sydenham, where an object lesson may be learnt from the courts decorated in the different styles. Unfortunately in this country we have but few examples of ancient decorated buildings to study from and have to be content with the fragments in our museums and the various objects to be found there. Still, one must take things as they are and be content; but however beautiful the various fragments are, they have not the teaching that applied decoration to a building possesses; to obtain this you will have to go abroad and study the style you wish to become acquainted with in its own home, with all the surroundings which so influence the art. Much and most useful information is to be gathered from the splendid works which have been published, and which you may see at the museums and in the library of the Institute and Architectural Association. They are magnificently illustrated, but the colours can only faintly show the effect that the building produces under the ever-varying light and shade. As it is hardly possible to study all the styles in the land where they have had their birth, you must study from those specimens which we possess and from books.

One of the uses of possessing a knowledge of the styles is that you never know when you may be called upon to make use of this knowledge, and you should look upon it as part of your education, and that there is no better way of familiarising yourself with them than by such study. Your sketch-book studies should include all the information you can acquire from books, and let that information be culled from the best writers on the subject; but bear in mind, a closer and more thorough study will have to be made of those styles in which you are thinking of working. What is the best style to adopt for *fin de siècle* decoration? asks the bewildered student. The hum from the battle of the styles fought in the sixties is now at rest, and we are content to admit in the nineties whatever is the fancy of the day, until maybe, at no long future, an Architectural Association student will be found, sketch-book in hand, lost in admiration of the severe simplicity of Gower Street architecture.

Yes, all is changed, and we are agreed that there is now no style in architecture which is worth dying for. For some years past men's faith in thirteenth-century work as the *ne plus ultra* has been rudely shaken, and the influence of a younger school of clever architects, led by Sedding, changed our faith, or, say, admitted into it greater latitude, and in the Church of the Holy Redeemer, Clerkenwell, and Holy Trinity Church, Sloane Street, we feel this force of Sedding's power and recognise what his teaching was; that we were free to adapt from the various styles what seemed most fitting and to cast aside the bonds of formalism, which required chapter and verse for every feature introduced into a building. He declared trumpet-tongued that he, for one, would not be "cribbed, cabined and confined" by canons which the older men had laid down, and maintained that salvation was also to be had in the "flat and pointed" with a little Classic, of a kind that would have made the men of the schools smile and wonder. Yet under Sedding's inspiration we feel, and more especially those who knew and loved him, the influence of his magic; and even though we refuse to go all the way with him, we cannot but recognise the power and that something which it is difficult to define, but which we call genius.

What Sedding's status will be in the hierarchy of art we must leave to the future; with the restraint that his genius imposed, what we feel perhaps inclined to condemn we are compelled to condone. It is in his followers that we have to look for results, and we have not had to wait long for them; the illustrations published in the professional journals are many of them strange and eccentric. They exhibit a likeness to the work of the master, but the spirit is wanting in them. But though these efforts may fail, are they not the outcome of the cry for freedom from the shackles of formalism? If men, in the joy of this freedom, may here and there stray into the paths of licentiousness, let us not be too severe in our condemnation.

As Architecture is the mother of arts, so she must influence for good or evil her daughter Decoration. No longer will men tolerate a cold, lifeless revival of the past, a grinning skeleton galvanised into life. Sedding's gospel of freedom is heard and felt, and what he taught finds many disciples.

In every known style under the sun there is truth and beauty, and a likeness which makes them all akin, and as the bee sucks the honey from every flower, so may we gather the sweets where we will. Who shall say that we are not to make use of ornament, no matter where we find it, if we have the wit? not a mere copying, but ideas worked out from it. "Whatsoever was written aforetime was written for our learning;" may we not employ the words without irreverence? Evolution is at work now as it ever was and ever will be. And what a perplexing state of things exists in our midst, and what difficulties it creates. The artist-decorator may in the course of his practice be called upon to decorate a church built in the Classic style, the Renaissance, the Romanesque, the Byzantine, the Mohammedan or the Gothic; he will be required to do so in the correct style, as it is called, of the period of which the particular church is an example. Another time it will be a theatre, a concert or ball-room or mansion where maybe particular rooms are to be decorated in particular styles; such a house I came across some time since in the North decorated by that clever artist whom I have before mentioned, the late Mr. Cottier, but with his skill and inspiration one was forced to be pleased. Is it not, however, appalling this demand upon the artist? No wonder if he bewails the age in which he has been born, and from sheer weariness closes his eyes and dreams of a time in which one style was in vogue, and one only; no newspaper critics, no art journals, no books on art, no cant and jargon of the stereotyped order—the one style, which yet gave infinite latitude to the ordered mind and the inventive genius. Small wonder that, with time to work out his idea, the Greek artist excelled in beauty of design which never lacked grace, and that quality of fitness and repose are also to be found in the best Japanese art, which, alas! in its turn threatens now to become a thing of the past.

But our dreamer awakes to the fact that he can only in dream world live in Greece or Italy in their period of greatness, and that he is obliged to pass his days at the end of the nineteenth century in a murky atmosphere, with all its hurrying and skurrying; to enter the lists with his fellows and compete for the prizes; and the prizes are to the skilled and the strong. Surely it is wiser not to be troubled over much about what style to adopt, *i.e.* any of the various styles of decoration; more important surely to cultivate a good style—to study the old styles and try to absorb the principles to be found in them Then if you elect to follow any one style in particular, to do s in the spirit in which it is conceived, and not to attempt the impossible or to revivify the past—here is unlimited scope. Take English as it is spoken at the present day—a language rich in its antiquity—and yet how many words and phrases are

borrowed from other nations. And in America how much more is this the case; and Americans, less trammelled than we, are producing work the best of which is distinctly modern and original in character.

One of the problems in colour decoration is to employ only those colours which will look well both by daylight and artificial light. These will be influenced again by the amount of daylight which is obtainable in the place which is to be decorated. Here only experience will guide you correctly, and here I may say how very difficult it is to prepare any sketch or drawing to show what you propose. Some artists positively refuse to do so, and no wonder. Still there are clients who insist on having an idea of what the design is to be, and who will see a sketch first; and to a young artist just starting on his career, not to show what he is going to do may be fatal to his employment. Therefore, if it is insisted on, show as little colouring as possible, enough to give the general scheme, and guard yourself by saying that circumstances may compel you to alter as you go along. When the client has approved of a scheme, the best thing that can happen for both client and artist is, that the former shall go abroad for a short time and not see the work through all its stages until finished; for should the client not absent himself, but look in to see how the work is going on, he will in all probability destroy his own peace of mind and that of the artist.

Now interiors have to be used by daylight or by artificial light, and by both day and artificial light. By daylight, as picture galleries, banks, courts of justice. By artificial light, as theatres, ballrooms and other places of amusement, and by both day and artificial light, as churches, assembly and concert rooms, &c., and private houses. Under these conditions of lighting come others, and in the way in which they are met will depend largely whether the decoration is successful or otherwise. A quiet half-hour in the place you are called upon to show your skill, with sketch-book in hand, will be time well spent.

If the place is used by daylight, note what amount you have at your disposal, or will have when the windows are upholstered; what is the aspect, north, south, east or west. Then for what use the apartment is to be put, and whether it is wanted for summer or winter use. Then, again, at what time of the year you see it, so as to judge of the amount of light; if a sombre and subdued effect is sought for, or a bright and cheery one. If, again, the apartment is to be used at night, obviously your colours must be tried by artificial light, and make your experiments by that kind of light which is to be adopted. If for day and night use you must use those colours which look well by day and night. The design thought out, you must first try the colours you are proposing to use upon the walls or ceiling, noting whether they are what you intended, and how one colour goes with another, always judging of this at the distance it will be when executed, and settling this upon the spot. This trial of colours upon the spot is of the first importance, as many are the changes that take place, and what looks well in one place looks bad in another. The experiments may be in colour only, without any design upon them, or you may, better still, put up full-size coloured cartoons in situ and judge of the effect. It is a good plan to leave them up for a day or so; frequently it happens that after an interval you come upon the design with a fresh mind and can form a better judgment than at first, and decide in what points you think they need amendment and whether, as is very probably the case, you may omit some of the detail, strengthen and accentuate those parts which require it and send back or bring forward others. Do not hurry over this stage of your work, it may take you hours only trying the colours and effects. Decoration needs the exercise of all the virtues, and patience in particular, and you cannot properly decide questions of colour with watch in hand nearing the hour at which your train starts. Let him who thinks of embarking on the pursuit of decoration think on these things. When you get the colours and the design settled somewhat to your liking you may consider yourself happy; vigilance will still be required, but the worst is over. If you have a good, intelligent and honest foreman of painters another great weight is taken off your shoulders, and by all means in your power interest those who are carrying out the work for you, and do not spurn their advice. It may be that you have to collaborate with some figure or landscape artist, and then your whole scheme of colour has to be subservient to his work. In fact, no two cases will be alike, and it will call forth all your powers of intelligence to meet and overcome the many difficulties that may arise.

And the payment for all these years of study spent upon decorative work? Your payment must be in the first place the delight of doing colour and design, for it is seldom you are paid adequately for the labour and time it involves. You will sometimes find clients who are under the impression that the 5 per cent. will cover your expenditure of brains and time, and be genuinely surprised when you tell them that such payment is totally inadequate. A gentleman connected with a large firm of decorators once told me that they reckoned 20 per cent. in their estimates for the "brains," and for good work requiring special skill and much time this is not excessive. Where a price is given for the work complete, a man knows what he is spending—stock, lock and barrel—and pays the bill cheerfully. But if, plus the actual cost of the decoration, a client has to pay the architect for his brains, skill and time on the design he frequently feels aggrieved. Unreasonable, is it not? But a fact.

Perhaps the best advice, from a purely commercial view, to get what you honestly can, acquire a name and fame by judicious self-advertisement, strive to cultivate a mannerism, become the fashion by letting it be known far and wide by the blast of the sound of your own trumpet, that you are the man to employ, and then society will pay you anything in reason and out of reason—you like to ask. I fear that what I have said will appear to be as "bald unjointed chat," but if I have succeeded in dropping some seed which, falling upon fruitful soil, may grow, it will not be in vain that I have set down the thoughts that occurred to me, though I could have wished they were in a better setting, more worthy of your acceptance and of those who did me the great honour of asking me to give a paper on colour decoration.

The Chairman said they were grateful to their old friend and past-President for coming again among them and giving all the benefit of his advice. One kind of low relief decoration described in the paper was not altogether new. As regards other kinds of decoration, the speaker thought it was a little too severe to say that mosaic work was unsuited for all surface. An example of this decoration was to be seen at St. Paul's Cathedral, and it showed that the work on the flat was not a failure. The value of stencil-work could not be denied, and where there were many repeats in work it was used to great advantage. The lecturer might have told them what colours he preferred to be used in decoration, and the special process to be followed for such a climate as that of England.

Mr. L. A. Shuffrey, who proposed a vote of thanks, said the suggestion the lecturer made regarding the study to be specialised upon decorative work was an excellent one, and there was plenty of scope for a student so inclined, but it was hard to say how his labours were to be remunerated. Unfortunately people nowadays would seldom embark upon any work before they were told how much the whole would cost. When they did hear the price clients generally cut down the figures so as to leave a very small chance for the good decorator to show his skill. Estimates had very often to be submitted for such work as they had heard described, and these did not help on the decorative artist. The client, too, very often had ideas of his own and it was difficult often to contend against his conclusions.

Mr. J. D. Crace, in seconding the vote, said every decorator should be guided by respect for the architecture of the building and try to make his work in sympathy with that of the architect. The architect, in his design, had done all he could for light and shade, and the decorator would have to introduce a scheme of colour which would bring out the accentuation of the features of that design.

Mr. Hampden W. Pratt said it seemed unfortunate that in many cases a method of decoration was introduced into a building which had never been contemplated by the architect and which helped to ruin the architectural character of structure. In the work in St. Paul's Cathedral they had an artist carrying out decorative schemes without regard to the architecture, and without the control of a member of the craft.

Mr. E. Howley Sim and Mr. Matt Garbutt also added their thanks.

THE HELLENIC SOCIETY.

THE second general meeting of the session 1898-99 of the Hellenic Society was held on February 23. The chair was taken by Mr. Talfourd Ely, and a paper was read by Professor Ernest Gardner on "A Head of Athena from the School of Alcamenes." This head, which was one of the finest pieces of marble extant, had, Mr. Gardner observed, been recently acquired by Dr. Nelson, of Birkdale, Liverpool. It formed part of the collection made in Italy between 1748 and 1753 by Hollis, and later it passed into Disney's hands. It did not, however, form part of the collection presented by Disney in 1850 to the Fitzwilliam Museum, but remained at Ingatestone and was sold in 1885. He had to thank Dr. Nelson for the valuable assistance which he had given him, and for the photographs which he showed to those who were present, and which were to be published in the Hellenic Society's journal. It was clear to a careful inspection that the nose had been restored in Parian marble, taken from the hair at the back, and it was very badly modelled. The whole nose and bust were in fact modern, and in Dr. Nelson's opinion the work of an Italian of the last century. The helmet was of the ordinary Attic type and there was distinctly traceable at the side the felt cap which was worn under the helmet to prevent its chafing the brow. The technical characteristics of the eyelids, and the slightly open mouth, with its kindly expression, indicated that the work

w; assignable to the fifth century, and was probably o a man trained in the school of Pheidias. There were e ments in this Disney head essentially different from the work o he fourth century, and a comparison of this with other heads i the Louvre and elsewhere suggested Alcamenes as the s lptor from whom or from whose school the work proceeded.

GLASGOW ARCHITECTURAL ASSOCIATION.

AT the usual fortnightly meeting, held in the rooms, 187 Pitt Street, Mr. Wm. J. Anderson delivered a lecture entitled "Impressions of a Mediterranean Trip," describing, mostly in a light and humorous manner, a cruise by way of Algiers and Malta to Athens, and a return journey by Corfu, Naples, Nice and the Loire district of France for purposes of architectural study. Among impressions of the tour which he indicated were the feeling that good design and largeness of conception had been evinced in the planning and extension of most continental cities, while they were almost wholly absent from ours, and that there existed an aspiration for something beyond the fulfilment of mere material necessities in their public buildings. This was to be attributed, especially in the case of France, which in such matters led the Continent, to the steadying influence of sound traditions of architectural education, which is permeating society with the understanding and the love of it fostered the desire as well as provided the talent for its realisation. More particularly have we to learn the lesson in so-called engineering works, such as bridges, railway stations, markets, &c., which in France are often among the most successful works of its brilliant school of architects. No question of art was at all comparable to the need for the improvement of our cities in these respects, and for skilled control of the development of their plan. In an Anglo-Saxon community it would almost seem as if the provision for animal necessities was sufficient, and that to aspire in our handiwork after anything nobler than the aims of the bird and beaver was to be hopelessly Utopian as unpractical. Concluding, the lecturer urged the claims of a more extended historical study of architecture, not for practical reasons only, but as examples of the higher manifestations of nature reaching us through the human spirit, whose path in relation to every essential matter of progress was marked by its monuments. Mr. W. H. McNab moved a vote of thanks to the author for his very able paper, which was heartily accorded.

ATMOSPHERIC INFLUENCES.

AT a meeting of the architectural section of the Philosophical Society of Glasgow in the hall of the institution in Bath Street—Mr. P. Macgregor Chalmers presiding—a paper was read by Mr. Oscar Paterson, glass stainer (Royal Scottish Society of Arts, &c.), on the subject of "Atmospheric Influence in Architecture and Decorations." The paper, which was amply illustrated by chemical demonstration and a large number of lantern slides, was extremely interesting. In the course of his remarks, the lecturer pointed out that the very offensive and noxious condition of the atmosphere of Glasgow was the resultant of the free escape of factory smoke and the subsequent oxidation of the sulphur in the coal into sulphuric acid. The immediate result of the dissemination of this corrosive and virulent compound was observed in the erosion of the stone of the public buildings in the city, and the destruction of vegetation, while the free molecules of carbon carried over in the soot of factory smoke, settled on stonework, turned the natural brightness of the material into a gloomy and sombre grey, destroying at once the precision, fineness and quality of the architecture. Mr. Paterson dwelt on the condition of the statuary in Glasgow's public squares, and while deploring the offensive condition of its surface, where all the intrinsic quality of the material was entirely destroyed by the coating of oxy-sulphides and other impurities which had formed or been deposited there, he suggested a mode of treatment based on experiments adopted by the municipality of Berlin. The stonework of the municipal chambers of the city was beginning to succumb to the effects of the atmosphere. Referring to the action of the atmosphere on decoration, the lecturer pointed out that sulphuric acid and hydric sulphide were the principal factors in the change of colour that takes place in certain decorations. It was also suggested that by a due attention to an efficient medium and method of painting the most fugitive colours could be rendered nearly permanent. Glasgow ranked next to London almost in the impurity of its atmosphere, and however high a position the city might have acquired as an art centre, there was probably no other town in the kingdom where public buildings and decorations had so uncertain a condition of stability.

The Annual General Meeting of the Architects' Benevolent Society will be held on Wednesday next in Conduit Street, at 5 P.M. Professor Aitchison, R.A., will preside.

TESSERÆ.

Atmospheric Effects in Relation to Landscape Art.

NOTHING in nature is more enchanting than a beautiful landscape in the red of the evening. The rich manifoldness and mild outline of shapes, the infinitely varying play of light, the delicate veil which envelopes distant objects—all combine to charm our senses. Perhaps the soft murmur of a waterfall, the melody of nightingales, and pleasant music are added to increase our pleasure. We are dissolved in sweet perception of tranquillity, and while our senses are affected most agreeably by the harmony of colours, shapes and tones, the mind revels in an easy and spirited flow of ideas, and the heart in the current of its feelings. Suddenly a storm arises which darkens the sky and the whole landscape, which surpasses and drowns all other sounds, and suddenly deprives us of all our pleasures. Clouds, black as pitch, encircle the horizon, deafening thunderclaps descend, flash follows flash, and our sight as well as our hearing is most disagreeably affected. The lightning only shines to render the frightful night more apparent; we see it as it strikes—nay, we begin to tremble lest it may strike us also. Yet not the less do we believe that we have rather gained than lost by the change, those persons excepted whom fear deprives of all freedom of judgment. We are powerfully attracted in one direction by this fearful spectacle, which repels our senses, and linger in it with a feeling which indeed we cannot properly call pleasure, but which is often far superior to pleasure. But now this spectacle of nature is rather destructive than good (at least, we are not obliged to regard the utility of a tempest in order to find pleasure in such a phenomenon), it is ugly rather than beautiful, for darkness, as a deprivation of all the appearances which light creates, can never be pleasing; and the sudden shattering of the air by the thunder, and its sudden illumination by the lightning, contradict a necessary condition of all beauty, which admits nothing abrupt, nothing violent. Further, this phenomenon is rather painful than agreeable to mere sense, since the nerves of sight and of hearing are painfully strained, and then just as violently relaxed, by the sudden alternations of darkness and light—from the roar of the thunder to silence. And notwithstanding all these causes of displeasure, a tempest is an attractive appearance for one who does not fear it.

Art in Bohemia.

To Bohemia undoubtedly belongs the honour of having created the first national school in the Austrian dominions, for even so early as the latter end of the fourteenth and beginning of the fifteenth century, when the Emperor Charles IV. held his court in Prague, the encouragement which painters, sculptors and architects of every nation there received soon raised a healthful spirit of emulation among the native artists of that country, among whom the names of Kunze and Theodorich of Prague stand pre-eminent. The works of the early Bohemian school possess all the errors in drawing and perspective which characterise the old German style. The last and the present centuries have, however, produced many distinguished Bohemian artists, who justly earned for themselves and their country considerable reputation in painting. The imperial city of Vienna was one of the last places in the monarchy where native art commenced to flourish; how far this circumstance may have arisen from the want of that encouragement to artists and that fostering care of art (such as she now denies to science), the records make no mention, for although we read of the protection afforded by Rudolph II., the school has made but little progress till the present time. In 1704 an academy of painting and sculpture, under Leopold I., was founded in Vienna and furnished with models of the best antiques from Rome and Florence; thus the foundation was laid, but no superstructure arose upon it, and a very few years after its erection it fell into decay. In 1726 it again rose into life, and a school of architecture was connected with it; but the first great step towards the formation of a school of art had its origin in the collections commenced by the noble families of Lichtenstein and Schwartzenberg, and by the protection and patronage which they afforded to architects, sculptors and painters during the latter part of the eighteenth century. Under Joseph II the academy was enriched with many new and splendid works of art, liberally endowed by this patriotic emperor, divided into separate schools for its several branches and placed under the direction of Frederick Füger, a painter of acknowledged and superior merit.

The Ideal Athens.

We see Athens in ruins. On the central rock of its Acropolis exist the remains, in a mutilated state, of three temples—the Temple of Victory, the Parthenon and the Erechtheum; of the Propylæa in the same place, at its western entrance some walls and a few columns are still standing; of the theatre on the south side of the Acropolis, in which the dramas of Æschylus, Sophocles and Euripides were represented, some

stone steps remain. Not a vestige survives of the courts in which Demosthenes pleaded. There is no trace of the academic porches of Plato, or of the lyceum of Aristotle. The pœcile of the Stoics has vanished; only a few of the long walls which ran along the plain and united Athens with its harbours, are yet visible. Even nature herself appears to have undergone a change. The source of the fountain Callirrhoe has almost failed; the bed of the Illissus is nearly dry; the harbour of the Piræus is narrowed and made shallow by mud. But while this is so, while we are forcibly and mournfully reminded by this spectacle of the perishable nature of the most beautiful objects which the world has seen, while we read in the ruins of these temples of Athens, and in the total extinction of the religion to which they were dedicated, an apology in behalf of Christianity and a refutation of paganism, more forcible and eloquent than any of those which were composed and presented to the Roman Emperor by Aristides and Quadratus in this place, we are naturally led by it to contrast the permanence and vitality of the spirit and intelligence which produced these works, of which the vestiges either exist in a condition of ruinous decay or have entirely disappeared, with the fragility of the material elements of which they are composed. Not at Athens alone are we to look for Athens. The epitaph, "Here is the heart: the spirit is everywhere," may be applied to it. From the gates of the Acropolis, as from a mother city, issued intellectual colonies into every region of the world. These buildings now before us, ruined as they are at present, have served for 2,000 years as models of the most admired fabrics in every civilised country of the world. Having perished here, they survive there. They live in them as in their legitimate offspring. Thus the genius which conceived and executed these magnificent works, while the materials on which it laboured are dissolved, has itself proved immortal. We, therefore, at the present time, having witnessed the fact, have more cogent reasons for admiring the consummate skill which created them than were possessed by those who saw these structures in their original glory and beauty.

Property in Land in Prussia.

It will scarcely be believed that, up to 1807, a person not noble could only by accident find a piece of land, whatever number of estates might be in the market, which he would be allowed to purchase. By far the greater portion of the landed property consisted of estates-noble, and if the proprietor brought his estate into the market only a nobleman could purchase it. The merchant, the banker, the artist, the manufacturer, every citizen, in short, who had acquired wealth by industry and skill, lay under an absolute prohibition against investing it in land, unless he previously purchased a patent of nobility, or stumbled on one of those few spots which, in former days, had escaped the hands of a noble proprietor, small in number and seldom in the market. Even Frederick the Great lent his aid to perpetuate this preposterous system, in the idea that he would best compel the investment of capital in trade and manufactures, by making it impossible to dispose of it when realised in agricultural pursuits—a plan which led to the depression of agriculture, the staple of the kingdom, as certainly as it was directed in vain to cherish artificially a manufacturing activity, on which the country is much less dependent. This could not possibly last; the noble proprietors were regularly becoming poorer, and the same course of events which compelled so many of them to sell disabled them generally from buying. Destitute of capital to cultivate their own estates, it was not among them that the purchasers of the royal domains were to be looked for. In 1807 Stein swept away the whole mass of absurd restrictions, and every man was made capable of holding every kind of property.

Tintagel Church.

For centuries, very probably from the very dawn of Christianity in our land, has Tintagel Church borne her silent testimony to its truth. And doubtless many a tempest-tossed and weary mariner, as he listened to the happy, cheerful peal from the tower, carried away far over the surface of the dark, deep sea, has longed to have the wings of a dove that he might escape from the perils of the ocean and find refuge in the courts of the Lord's house. The grandeur of the surrounding scenery, with its gigantic and rugged cliffs, its bluff headlands, its magnificent sea, which in fine weather is as clear as amber, as blue as the waters of the Mediterranean, and, above all, its fine bracing air, harmonises well with this ancient church. And few who have ever entered it for the first time have not been impressed with its peculiar solemnity as well as with its extreme antiquity. In the Oxford Glossary Tintagel Church is noted as one of the few in England which contains any portion of Saxon work, and to the archæologist as well as the architect it possesses many features of interest. The church is cruciform, and there is a small chantry chapel attached to the north wall of the chancel. Here may be seen the original stone altar, with the five crosses marked in the altar-slab. The south door is a beautiful specimen of Early Norman. The screen is in good preservation, and in the nave are nearly all the benches with their carved ends. It is a curious circumstance that Tintagel Church contains portions of every period of architecture, from the Saxon to the Perpendicular.

GENERAL.

The Rembrandt Exhibition at the British Museum was opened to the public on Wednesday. It forms an excellent collection of drawings and etchings by the master, and etchings by his contemporaries.

Mr. Ernest Runtz, of 10 Walbrook, informs us that Mr. Albert C. Breden and Mr. George McLean Ford, who have been associated with his business for many years, and are well known to his friends and clients, have now an interest in the firm, which in future will be known as Ernest Runtz & Co., architects.

A Second Statue of Joan of Arc is about to be set up in Paris. The position selected for the work of M. Paul Dubois is in front of the church of Saint-Augustin. The pedestal is to be designed by M. Formigé, architect.

The Royal Institute of Painters in Water Colours on Monday elected Mr. Alexander McBride and Mr. Edward Clifford as members.

M. Benjamin Constant has completed his portrait of the Queen in her royal robes seated on the throne in the House of Lords.

Mr. Thomas Corson, for many years connected with the town clerk's department, Leeds, was interred on Tuesday afternoon at the Woodhouse Cemetery.

The Sixth Ordinary Meeting of the Liverpool Architectural Society will be held at the Law Library, 41 Castle Street, on Monday next, March 6th, at 6 P.M., when a paper will be read by Edward S. Prior, M.A., on "Business Architecture."

The Metropolitan Asylums Board on Saturday last resolved that a surveyor to the Board be appointed, that he should rank as an officer on the staff of the head office, that candidates should not exceed forty years of age, and that subject to the approval of the Local Government Board, the salary of the new officer should commence at 500*l.* per annum with travelling expenses, office accommodation, and such assistance as the managers might from time to time deem necessary.

The First Commissioner of Works has announced that the width of the new Parliament Street between the building will be about 140 feet and the width between the kerbs about 95 feet. The front of the new buildings will be set back from 10 feet to 15 feet from the corner of the Home Office. The approximate height of the new public offices will be 78 feet, the tower at the south-east angle being about 106 feet. The arrangement of the refuges will follow those already in existence in Parliament Street, which have been found most convenient for traffic purposes. The width of the new Charles Street will be 80 feet.

A Sessional Meeting of the Sanitary Institute will be held at the Parkes Museum on Wednesday, March 8, at 8 P.M., when a discussion will be opened on "The Establishment of Public Abattoirs in the Metropolis in relation to the prevention of Tuberculosis," by Mr. William Arthur Bond.

The Old Mansion known as Riddlesworth Hall, dating from 1780, the seat of Mr. W. N. L. Champion, which on the 10th ult. was the scene of a most destructive fire (little being left beyond the bare walls), will, we understand, shortly be rebuilt from designs of Mr. Herbert Green, of Norwich. The building is covered by insurance to the extent of 20,000*l.*

It is Proposed that the salary of Mr. T. J. Bailey, architect of the London School Board, be at once increased to 1,100*l.* per annum, and that a further increase to 1,200*l.* per annum be granted at the end of a year from the date when the first increase takes effect. Mr. Bailey has been engaged by the Board for over twenty-six years.

The Leeds City Council on Wednesday adopted the following resolution:—"That in the opinion of this Council it is expedient that new Law Courts be provided in the city, and that it be an instruction to the property committee to make inquiries as to a suitable site and report to the Council."

Mr. John Harrison, who seven years ago succeeded the late Sir George Morrison as town clerk of Leeds, has announced his resignation. He has received 1,250*l.* a year, and the cause assigned for the resignation is the refusal of the finance committee, by a majority of one, to raise the amount to 1,500*l.*—the salary paid to Sir George Morrison.

The Next Ordinary General Meeting of the Surveyors' Institution will be held at 12 Great George Street, S.W., on Monday next, March 6, when a paper will be read by Mr. F. J. Smith (Fellow), entitled "The Working of the Light Railways Act, 1896." The chair will be taken at eight o'clock.

THE

Architect and Contract Reporter

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to se in connection with the law, practice rules and cedure under the above Act, we have added to our ff A VERY EMINENT BARRISTER, who has made subject a special study, and will be glad to answer the columns of this paper any questions relating to complicated matters arising from the provisions of difficult Act. Our LEGAL ADVISER will further wer any legal question that may be of interest to readers. All letters must be addressed "LEGAL VISER," Office of "The Architect," Imperial Build , Ludgate Circus, London, E.C.

EDITORIAL NOTICES.

authors of signed articles and papers read in public must necessarily be held responsible for their contents.

communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

espondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts, Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

NEW READING CASE.

o Librarians of the Public Libraries and Reading-ns.—A new handsome Reading Case can be supplied nominal charge of 2s., by post 2s. 6d., on early ication to the Publisher, Imperial Buildings, Ludgate s, London, E.C.

For Advertisement Scale, see page xiii.

COMPETITION OPEN.

RADFORD.—April 14.—Designs will be invited for the on of the Bradford Corporation Cartwright Memorial at a cost of 38,000*l.* Three prizes will be offered, value 100*l.* and 50*l.* respectively. Particulars will be found in er column.

CONTRACTS OPEN.

ALNWICK.—March 7.—For erection of a branch shop and dwelling-house at the corner of Wagon Way and Swansfield Park Road. Mr. R. R. Temperley, Alnwick Castle.

ASHTON-UNDER-LYNE.—For erection of fourteen cottages, Cockbrook, Ashton-under-Lyne. Messrs. Thos. George & Son, architects, Old Square, Ashton-under-Lyne.

BARWICK-IN-ELMET.—March 7.—For erection of Wesleyan memorial chapel at Barwick-in-Elmet. Mr. G. F. Danby, architect, 10 Park Row, Leeds.

BARNSLEY.—March 6.—For erection of five houses and shops at Stairfoot. Messrs. Duncan & Jones, Stairfoot.

BATTLE.—March 11.—For repairing the Zion chapel. Mr. Eldridge, 18 Mount Street, Battle, Sussex.

BRADFORD.—March 8.—For alteration of shops in Market Street. Messrs. Milnes & France, architects, Bradford.

BLAYDON-ON-TYNE.—March 6.—For erection of six houses and additions to business premises at Low Westwood. Mr. G. T. Wilson, architect, 121 Durham Road, Blackhill.

ST. PAUL'S CHURCH, West Smethwick, which has closed for several months whilst a scheme embracing tions, additions and repairs has been carried out, has no reopened. The galleries at the west end and over the transept have been taken away, and the principal entra the church has been arranged under the spire. The formerly occupied by a staircase to the gallery has been to form a porch. A baptistery has been provided at th end of the church, and this contains a handsome ne The whole of the old seats in the nave and south transe been removed, and the seating and aisles have been rear so that now there are three aisles instead of two, as fo A new boarded floor has been fixed under the whole seating, the aisles having been laid with red tiles. The h and lighting arrangements of the edifice have also und considerable revision and improvement, the long gas p which formerly hung from the ceiling having given p ornamental brass and iron standards fixed in the aisles interior of the church has been thoroughly cleaned a decorated. The work has been carried out by Mr. H. builder, of Oldbury, under the superintendence of Mr. architect, of Smethwick.

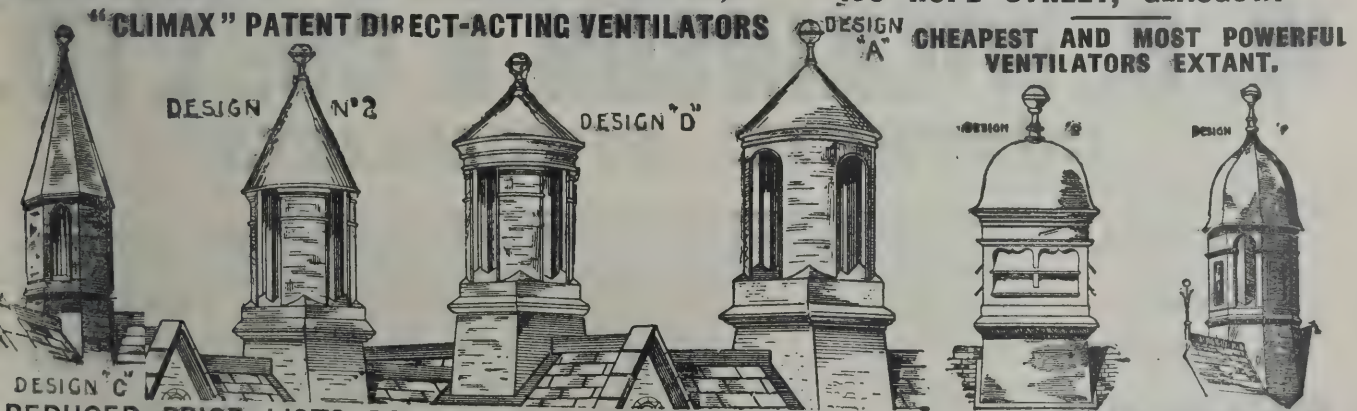
BUILDING AND BUILDERS.

A NEW parsonage is being provided for the incumbent of Carnforth at a cost of 1,600*l.*, in addition to the sum of 160*l.* which was given for the site.

IT has been decided to erect a new United Presbyterian church at West Derby, Liverpool. The promoters are in treaty with the Liverpool Council for the purchase of a site in Green Lane.

AT Bridlington on the 23rd ult. the foundation-stone was laid of the Yorkshire Foresters' Orphanage and Convalescent Home, by Bro. R. S. Kirk, of Leeds, and several memorial-stones were laid by representatives of the various courts and districts of Yorkshire. The building is being erected by Messrs. F. Blackburn & Son, of Hull, and the architect is Mr. Robert J. Beale, of 9 Victoria Street, Westminster, whose design was selected in competition.

THE work of restoring St. Nicholas Church, Strood, Kent, after the recent fire in the tower, is about to be taken in hand. The insurance companies concerned have assessed the damage at 1,805*l.* The turret destroyed by the fire was out of harmony with the general character of the Early English tower—the sole remaining piece of the architecture of the ancient church—but it has been decided to adopt the battlemented parapet style in carrying out the restoration.



LORD ALWYNE COMPTON, bishop of Ely, dedicated on the 22nd ult a new church at North Side, Whittlesea, Cambridgeshire, which has been given by the Duke of Bedford for the accommodation of tenantry residing in that district of his extensive Thorney estate. The parish is one of the largest in England, and belongs almost exclusively to his Grace. Up to now people in this district have worshipped at one time in a coachhouse and at another in a kitchen, or had to walk several miles to the nearest church.

THE Finchley District Council has decided to purchase 2¼ acres of land upon which to erect thirty houses for the working classes, to be let at 7*s.* 6*d.* and 8*s.* 6*d.* a week. Half the land will be used for allotments until required for thirty more houses. Each dwelling will cost about 250*l.* to build, and the ground will be intersected by a 40-feet road. The total cost is estimated at 8,000*l.*, but it may amount to much more. The site decided upon is between East and Church End, Finchley, near where the Great Northern Railway Company are reported to be going to open a new station. Three members of the Council opposed the undertaking and eleven supported it.

A MEETING of the joiners in the Motherwell, N.B., district was held in the Co-operative Hall last week to consider the wages question, the meeting being the largest and most successful yet held in Motherwell in connection with the trade. Towards the end of last month a demand was made for an increase of ½*d.* per hour on the wages, the advance to begin on March 1. The reply of the masters to this request was that they were prepared to grant ¼*d.* per hour on March 1, another ¼*d.* of an advance to follow two months later. This offer the men refused, and they pressed for the full advance being conceded on March 1. Another reply from the masters is awaited, and if the demand is not conceded, it is probable a strike will follow, the district being in a well-organised state at present. The rate of wages ruling in the district at present is 8½*d.* per hour. The meeting also took up consideration of a set of by-laws, which will be placed before the employers shortly.

from the designs of Mr. Marshall Mackenzie, of Aberdeen, will be a handsome building in Aberdeen granite, situated at the junction of the principal thoroughfares Athol Street and Prospect Hill, Douglas. The style of architecture is Renaissance, and it has a fine bold effect, combining the appearance of great strength and stability with lightness and grace. The whole of the exterior will be executed in finely-axed granite, and the interior of the lobby will be of polished granite and of different varieties as to colour. All the granite work of the two elaborate fronts will be dressed in Aberdeen, and will be sent to Douglas by sea. On the ground floor the bank offices will be located and the two upper floors will be let out as business offices. When erected, the bank premises promise to form the finest block of buildings on the Isle of Man.

AMONG the plans approved by the Aberdeen plans committee last week, which will come before the next meeting of the Town Council for formal sanction, are those of the proposed new offices in Aberdeen for the Scottish Temperance Life and Accident Assurance Company, Limited. The new building will occupy the site of the dwelling-house, 154 Union Street, next to the Royal Bank. The site is unfortunately rather narrow, and the architects—Messrs. Jenkins & Marr, Bridge Street, Aberdeen—have consequently been somewhat hampered from an architectural point of view, but they have made the most of the space at their disposal. The style of the building may be described as free Classic. In height it will be 70 feet, with a width of 34 feet, and it will have a depth to Diamond Lane of 92 feet, which will to some extent compensate for the narrowness of the front. The basement will be occupied with cellars and stores, and on the ground floor there will be two handsome shops, with extensive saloons behind. These shops will be on either side of a fine central door, giving access to the upper floors. The door is surmounted by a moulded pediment. Up to the height of the second floor the building presents a fine effect, with the bold, oriel windows, surmounted by a balustrade. The architectural effect is accentuated by the ornamental gables in which the structure terminates above. On the first floor there are two sets of offices in the front, and one in the back of the building, and they are roomy and well lighted. In the second floor there is a slightly different arrangement, there being two offices in the front and two at the back. The third floor and attics will be let as a dwelling-house. On the level of the third floor there is a laundry and washing-house conveniently situated. Part of the first floor will be utilised as the Aberdeen offices of the assurance company. Apart from the cost of the site, that of the building is estimated to amount to 5,000*l.*

VARIETIES.

THE Duke of Connaught on Monday laid the foundation-stone of a new English church at Assouan.

THE Edinburgh streets and buildings committee reported the acceptance of an estimate by Messrs. M'Euen & Co., London, for 115,000 Blackbutt blocks at 10*l.* 16*s.* per 1,000, for the wood-paving of Princes Street.

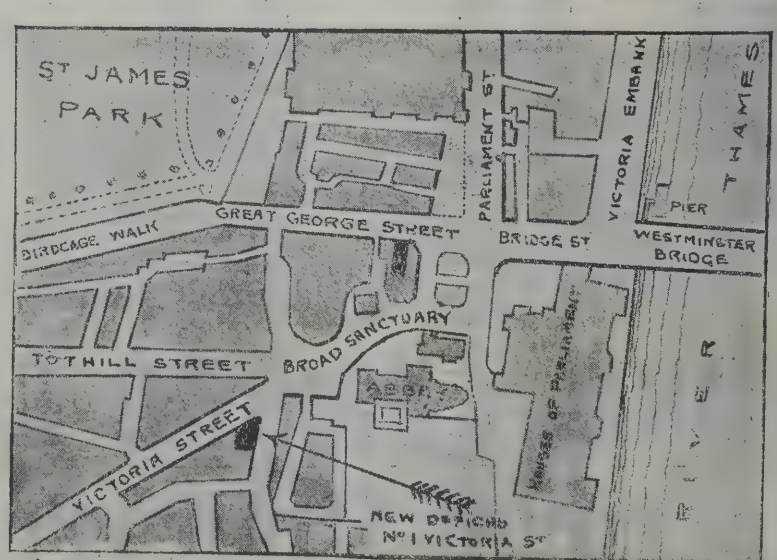
THE net value of the estate of the late Samuel Bayliss, of No. 5 Hanover Terrace, Regent's Park, London, civil engineer and contractor, who died last November, has been sworn at 545,849*l.* The deceased died intestate.

THE new place of worship which has been erected in Grangemouth, N.B, by the congregation of the Kerse Established Church, was dedicated for public worship on Friday afternoon.

A NEW elementary school which has been erected in George Street by the Dumfries School Board was opened on Monday. It is a handsome building, having cost (with the site) nearly 10,000*l.*, and it takes the place of the old Greensands school, in the same neighbourhood. It provides accommodation for over 500 pupils. The architect is Mr. Crombie, Dumfries.

THE spring provincial meeting of the Auctioneers' Institute, which now numbers considerably over 1,000 members, will be held at Derby on Thursday and Friday, March 9 and 10. The Council and members will be received in the Guildhall by the mayor (Alderman E. T. Ann), after which the general business of the Institute will be transacted by the Council.

THE workmen engaged at Messrs. Lakin's works at Stockton, near Leamington, have dug out a cinerary urn, of beautiful and artistic design. It is said that there is only one other example of the kind outside the South Kensington Museum. It is unfortunate that, in excavating the urn, the workmen broke one of the handles.



THE trustees of the Elder Bequest have decided to give to Free Trinity Church, Leith Walk, Leith, a legacy left by the late Mr. Thomas Elder amounting to 10,000*l.* It has been arranged that a new church shall be erected on the site at a cost of 6,000*l.*, that a manse should be built at a cost of 1,800*l.*,

Removal of London Office

From 15 Great George Street

TO No. 1 VICTORIA STREET, WESTMINSTER, S.W

Also at NEWCASTLE-ON-TYNE, and GREENHITHE, KENT.

and that the balance of 2,200*l.* should go to the endowment of the church.

The Board of Works have offered to sell the Menai suspension bridge, which connects Anglesey and Carnarvonshire, for about 15,000*l.* The gross rent of the structure is stated to be 1,700*l.*, there being an annual profit of something like 400*l.* after paying all expenses. The proposal was made to the Menai Bridge District Council, and was referred to the Anglesey and Carnarvonshire County Councils for consideration.

A start has been made towards pulling down business premises having frontages in Cheapside and St. Paul's Churchyard, with a view to the widening of the western entrance to Cheapside. In rebuilding the street-line will be placed back several feet. The improvement scheme also provides for the widening of the roadway at the junction of Newgate Street and Cheapside.

The Lord Bishop of Liverpool, Dr. Ryle, has written to the finance committee suggesting that the Corporation should consider the advisability of allowing the tower and spire of St. George's Church to remain standing. The surveyor and building surveyor have been instructed to report upon the work necessary to be carried out for retaining the tower and spire if the Council decide to adopt his lordship's suggestion.

The British Fire Prevention Committee, the establishment of which was the outcome of the Paris charity bazaar and Cripplegate fires, has now become a fully incorporated scientific society under the special sanction of the Board of Trade. It will be known as such from the 1st inst. The rapid development of the committee is mainly due to the energy of its executive, led by Mr. Edwin O. Sachs, and to the influence of its Council. Its scope is again being extended, another important section, dealing particularly with the safety of factories and workshops, being formed.

Two new blocks, an extension of the Royal Hospital, were opened at Portsmouth on Monday last by the Duke and Duchess of York. The new blocks are the local memorial of the Queen's Diamond Jubilee, and they have been erected at a cost of over 18,000*l.*, towards which more than 15,800*l.* was raised in Portsmouth and the neighbourhood during 1897. One of the blocks will be devoted to female patients, and the other to males, children being located in the old building. Thirty-seven additional beds will be provided, entailing for their maintenance, after the wards have been furnished, an annual expenditure of 1,700*l.*

The Old Manor House at Hythe has recently changed hands. The interior of the house presents many features of great interest. The terminal newel of the principal staircase is surmounted by a lion rampant supporting a shield, designed by Sir Edwin Landseer, and carved in oak, whilst the flight is illuminated by a magnificent lamp of ormolu with glass panels, which formerly hung in the Palace of the Tuileries. In the library is a large open fireplace, with an Elizabethan chimney-piece curiously carved with the words "Drede God and honour the King." Amongst the contents of the house, which are to be disposed of under the hammer in the spring, is a grand piano made for George IV. when Prince Regent.

The Edinburgh Architectural Association visited on the 25th ult. the works of Messrs. James Milne & Sons, Limited, and were received by Messrs. Milne, Lumsden & Macfie, the managing directors, who conducted the party in sections over the works, and afterwards entertained them to luncheon. Holyrood Palace was next visited, and over it they were conducted by Mr. W. W. Robertson. By special permission of Her Majesty the private apartments were open on the occasion, and over these they were shown by Mr. Robertson and by Mr. Sands, of the Lord Chamberlain's department. The secretary was requested to convey to Her Majesty, by Sir Spencer Ponsonby Fane, the thanks of the members for permission to make this interesting visit.

The annual meeting of the Temperance Permanent Building Society was held at the Memorial Hall, Farringdon Street, on the 22nd ult., Mr. James Pousty presiding. In proposing the adoption of the report, he said in 1892 the advances were 189,288*l.*; in 1898 they amounted to 301,276*l.*, and the mortgage securities had increased to 1,011,021*l.* The reserve fund had during that period risen from 46,924*l.* to 67,132*l.*, and was now over 10 per cent. of the share capital. The exceptional strength of the Society lay largely in the circumstance that over 90 per cent. of the mortgages were for sums not exceeding 500*l.*; thus, while others talked, they were quietly enabling multitudes to secure an old-age pension that would not die with them. The resolution was seconded by Mr. J. Bamford Slack and adopted.

At a meeting of the Paisley Police Commissioners on Monday last the clerk submitted the minute of a meeting of the committee appointed in connection with the proposed refuse destructor. The minute bore that the committee recommended that the commissioners should now take steps for

3 ft. 6 in., £5 4 0.

securing a site for the erection of a refuse destructor on the lands of Gockston, and that they contract with the Horsfall Company, Limited, for the erection of the works. Bailie Wilson moved that the minute be approved of. He said the committee, after mature deliberation, had arrived at the conclusion that there was no other way open to them for the destruction of town's refuse than by erecting a destroyer. Several questions were asked as to the site of the destructor, after which the recommendation was agreed to.

APROPOS of the fact that the Great Western Railway Company intend to carry out extensive alterations at Stourbridge Junction, and to erect a station at Chawnhill to supersede the present one, the clerk to the Stourbridge Council (Mr. W. W. Goddard) was instructed at a recent meeting of that body to write to the general manager of the railway company on the subject of the commencement of the work, and in reply to his inquiries has received a letter in which Mr. Wilkinson says :—"In reply to your inquiry, I have to state that a plan for constructing a passenger station on modern lines at the Chawnhill site, and for remodelling the goods yard, is being developed ; and I hope to be able to submit it to my board at an early date. It will, no doubt, in the circumstances, be a matter of interest to your Council to learn that at a recent meeting the directors authorised the removal of a large quantity of spoil to Stourbridge Junction for the levelling up of the ground preparatory to the carrying out of the alterations in contemplation."

IN his annual report the building inspector for York states that in the west division of the city there has, during 1898, been a small increase in the total number of dwelling-houses completed, but the number of better-class dwelling-houses far exceeds that of previous years. There has been a good demand both for purchase and occupation The districts where the better-class dwellings have been built are Scarcroft and Holgate. Of the cottage class a large number have been build in the Leeman Road district. Upon the new estate recently opened out on Bishopthorpe Road great activity is being displayed, and the demand for the smaller class of houses is great. The North-Eastern Railway Company have built large additions to the workshops at Holgate, which will provide room for the employment of several hundred additional workmen. On the east side of the city 265 dwelling-houses, mostly of the small and middle class, have been built on the Bootham, Clifton, Burton Stone Lane, Wigginton Road, Haxby Road, Heworth and Fulford Road building estates. Plans have been approved for new streets on Fulford Road, Hull Roa Haxby Road, Huntington Road, Heworth, Park Grove a Burton Stone Lane. Many large additions and alteratio have also been made to business and other premises.

TRADE NOTES.

THE new intermediate schools, Builth, are being warm and ventilated by means of Shorland's patent Manches grates.

IN the ventilation of Glengall Asylum, Ayr, now in cour of completion (Mr. Allan Stevenson, architect), "Cousland Improved Climax" patent direct-acting invisible chimn terminal ventilators and noiseless mica flap ventilators ha been used, supplied by the Climax Ventilating and Heati Company, Limited, 93 Hope Street, Glasgow.

A NEW illuminated turret striking clock, showing the ti upon four external dials 4 feet 6 inches each in diameter, a lighted by electricity, has just been fixed in the tower of t West Yorks Asylum, Wakefield, by Messrs. Wm. Potts & So church and turret clock makers, of Guildford Street and Coo ridge Street, Leeds, under the supervision of Mr. Vica Edwards, county surveyor, Wakefield. The clock strikes t hours on a bell of 6 cwt. of best bell metal. Messrs. Wm. Po & Sons are just finishing a large illuminated turret quart chime clock at Newcastle Asylum for Mr. Dyson, archite of Newcastle-upon-Tyne.

MR. PITTENDRIGH MACGILLIVRAY, A.R.S.A, has j completed in the clay a bust of Mr. William M'Ewan, M. which has been commissioned by the University of Edinbur in order to be placed in the grand hall.

AFTER years of contention as to whether Hackney shou be lighted by electricity through the medium of a company by parochial enterprise, the vestry in June last decided in favo of keeping the electric-lighting order in their own hand After seven months' consideration the committee have issued long report prepared by Mr. R. Hammond, and they recom mend that a scheme therein set out, which will cost, exclusi of charges for the site, 242,367*l.*, be adopted.

ELECTRIC NOTES.

HE Windsor Town Council has decided to light the rough by electricity instead of gas.

THE electricians of the Office of Works are just now sily occupied in illuminating Buckingham Palace. Hitherto ectricity has been used in the palace to a small extent, but fore the ensuing "season" is in full swing the whole of the ge edifice will be lighted.

THE electric-lighting committee reported at the monthly eeting of the Paisley Town Council that they had sent a plan, epared by Mr. Teague, of ground proposed to be acquired r extension of works, to the solicitors of the Paisley and arrhead District Railway Company, with the view of an rangement being come to for acquiring part of the field ljoining the works which has been scheduled by them under eir Act, but that they had as yet given no indication of their ews. The clerk was instructed to press the matter on the tention of the railway company. It was further reported by e committee that they had received a statement from Mr. eague, showing extensions of plant required, estimated to cost 750*l.*

THE Leeds lighting committee have decided to apply to e Government authorities for power to borrow 150,000*l.* to tend the electric mains in the city, enlarge the present nerating station in Aire Street and to acquire additional achinery. This sum, it is expected, will be adequate to meet e more pressing requirements for the next couple of years. t present new mains are being laid down through Hunslet as r as the Great Northern goods station, and from these it is expected that the majority of the large workshops in Hunslet will procure electricity for lighting purposes. In which direction the committee intend to further extend their mains has not yet been settled. A look at the map, however, with the present mains marked thereon, reveals abundant scope for enterprise. To anything like cater for the wants of the citizens, the mains ought at least to be treble in number. Ald. Wigram presided at the meeting.

MR. H. H. LAW recently held a Local Government Board inquiry at Doncaster Guildhall in connection with an application by the Corporation to borrow 30,000*l.* for the purpose of carrying out the works for electric lighting. The town clerk explained that the undertaking had the full approval of the burgesses. The proposal originated with a memorial from the burgesses that the Corporation should undertake the supply rather than allow the work to fall into the hands of a public company, and this feeling was emphasised when an extensively signed memorial, representing the largest ratepayers in the town, was presented against the scheme threatened by the company who proposed to supply a large area. The loan was asked for forty-five years. Of the amount (30,000*l.*), 5,000*l.* had been estimated as the cost of the buildings There was a compulsory area to be supplied, but there would be power to supply outside of this compulsory area. In addition, it was proposed to have a light railway, and it was contemplated to drive the trams through these works. Mr. Crabtree (borough surveyor) explained the situation and the nature of the buildings, &c. He explained that the workings would be on the three-wire system, and that of the full sum required it was estimated that 20,000*l.* would be absorbed by the compulsory area. It was explained that the amount 30,000*l.* was an estimate not based on tenders. On the conclusion of the inquiry the Mayor thanked the inspector, who went to view the site of the works.

AT a meeting of the electric lighting committee of Edinburgh Town Council on Tuesday last, it was agreed to recommend the acceptance of the following estimates for the M'Donald Road station:—Mason and joiner work, Mr. James Kinnear, Edinburgh, 25,000*l.*; storage batteries, Messrs. Pritchetts & Gold, Feltham, London, 6,665*l.*; overhead travelling crane, Messrs. Carrick & Ritchie, Edinburgh, 545*l.* It was agreed to adhere to the former recommendation of the committee in favour of the construction of a subway from M'Donald Road up Leith Walk to Picardy Place, at a probable cost of 11,000*l.* The question of joining the arrears of lamps

O ARCHITECTS, SURVEYORS, &c.

The Original Patentees and Sole Manufacturers of the MICA VALVE CHIMNEY BREAST VENTILATOR (patented by Comyn Ching & Co. under the name of "Thomas Boyle's Patent") having suffered for some time past by WORTHLESS IMITATIONS being supplied to Builders and others, which are badly fitted with inferior materials, neither Smoke-proof nor Proof against back-draught, are very noisy in action and soon get out of order,

Beg to call the attention of the Profession to the following fact:—

The only Perfect Ventilators have the Patentees' MONOGRAM CAST IN the front, and the only GUARANTEED NOISELESS is Ching's NEW PATENT SILENT Chimney Breast Ventilator with the NAME and MONOGRAM CAST IN.

TRADE MARK.

Any Infringement of the above Patent or Trade Mark Monogram will be subject to an action at law.

ARCHITECTS SHOULD SPECIFY

applied for was considered, and the feeling was that the electric light department being now in a position to take on all consumers desirous of being connected, and as the new station at M'Donald Road would be ready in October, there should be no difficulty in keeping up full pressure during the whole of next season. The committee agreed to recommend the Council to put down three additional boilers at Dewar Place on the ground lately acquired from the North British Railway Company.

WARINGS' NEW BOOK.

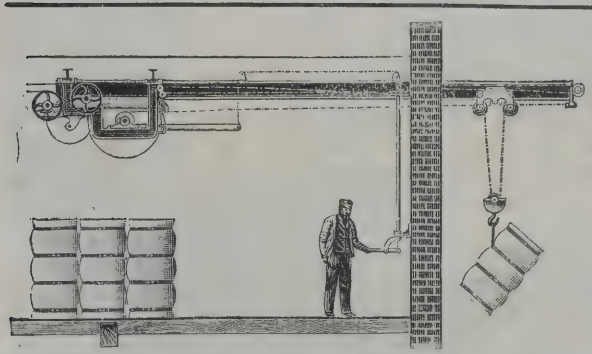
"RECENT CONTRACTS" is the name of the new work of art—there is no other designation suitable to it—just issued by Messrs. Warings, 175 Oxford Street. It is a veritable *édition de luxe*, exquisitely printed in two colours, and profusely illustrated with views of interiors of several among the numerous mansions, theatres, hotels, municipal and other public buildings, yachts, &c, which have recently been arranged and furnished by this well-known firm, the views being accompanied by interesting and at the same time elaborately descriptive accounts printed in English and French. So numerous, so well drawn and so beautifully printed are the illustrations, that a study of the book is quite an education in taste, and the greatest credit is due to everyone connected with the production of such a handsome result.

NEW CATALOGUE.

THE "B. & S." Folding Gate Company, of 20 John Street, Adelphi, have just brought out a profusely illustrated catalogue of the specialties the excellence of which has gained for the firm a widespread reputation. These comprise, as most of our readers are aware, artistic grilles for all purposes, such as bank and office enclosures, elevator and staircase guards, panels for all kinds of purpose, park grilles and gates, &c., in designs ranging from the simplest to the most elaborate, but all alike exhibiting excellent taste in their conception and carrying out, a quality which is also prominent in the balustrades and hand-rails, of which numerous specimens are given, and many of which have been carried out in the firm's electro-bronze finish, which is both highly artistic and at the same time particularly durable. The firm strikes out quite a new line in the designs for electric light fittings, many of which, equally original and elegant, are such as should gain a large amount of approval.

"RIPOLIN."

"RIPOLIN" is the name given to an enamel paint wh
although only recently introduced to the public, has been
jected to severe tests, and has been found in every res
eminently satisfactory from the points of view of wear
durability, and certainly the samples submitted to us le
nothing to desire on the score either of colour, elasti
or finish (whether gloss or matt). It is supplied in sixty-
different shades of colour, and other shades can easily
obtained by mixing. Suitable both for indoor and out
work, it dries in about eight hours, does not become detache
scale off, and has proved itself perfectly durable in tro
climates; therefore it may be considered as an excellent
for outdoor work, but it also merits preference for painting
interior parts of buildings such as panels, doors, ceili
window-frames and furniture, &c.



The same company (Ripolin, Limited, 110 Fench
Street) are also proprietors of "Rieps" anti-fouling and
corrosive compositions, which have been used by the D
steamship companies and several French and English
panies, viz.:—Royal Dutch Marine, the "Nederland" S
Navigation Company, the "Zeeland" Steam Navigation C
pany, the "Rotterdamsche Lloyd," the Royal Packet Boat C
pany (these steamers never leave the bad fouling waters o
Indian Archipelago), the Royal West Indian Mail Service
Royal Netherland Steamboat Company, British African St
ship Navigation Company, the Ocean Steamship Comp
La Compagnie Générale Transatlantique, Les Charg
Réunis, La Société Navale de l'Ouest, &c.

NATIONAL REGISTRATION OF PLUMBERS

ALDERMAN HUGH BELL, J.P., presided at the annual me
of the North of England District Council, held at Mid
brough on the 23rd ult. There was a large attendanc
plumbers and others interested in sanitation, including
Mayor of Stockton, Professor Phillips Bedson, M.A., D
Alderman Richard Hind, master of the Plumbers' Comp
Mr. Waynman Dixon, and the honorary secretary, Mr. C
Williams.

The secretary read the annual report, which stated
during the year eight new technical classes had been establi
in the north of England, but that only 10 or 15 per cen
those who entered for examination succeeded in satisfying
examiners in both the practical and theoretical tests.

mittee regarded with satisfaction the action of the Durham nty Council in awarding a scholarship to Mr. T. W. Agar, West Hartlepool, to enable him to attend the classes of anced instruction for plumbers held by the company at g's College, London.

It was proposed by Alderman Hind, seconded by Mr. ynman Dixon, and carried, "That this meeting, recognising the qualification of medical officers of health and the lification and certification of sanitary inspectors have been vided for under the Public Health (London) Act, 1891, is of nion that it is requisite for such statutory provisions to be nded to secure the adequate qualification, certification and stration of qualified plumbers, upon the efficiency of whose k the healthiness of a house virtually depends."

Professor Bedson then delivered a most interesting and ructive lecture on "Dust, and its Relation to Sanitation." lecture was made additionally interesting by means of elight illustrations and experiments.

GLASGOW BUILDING TRADES EXCHANGE.

the annual dinner of the members of the Glasgow Building des Exchange, which was held in the Windsor Hotel, onel Robert J. Bennett presided, and was supported by srs. Andrew Gray, Alexander Muir and William Anderson. William Anderson proposed "The Navy, Army and erve Forces." Mr. Gray replied. Mr. James Goldie then e "The City of Glasgow." Bailie Carswell replied. Mr. ker, Newcastle, proposed "The Glasgow Building Trades hange." He mentioned that, following the example of sgow, a Building Trades Exchange had been formed the Tyneside burgh, that there were between 170 180 members, and that they had been able to do e good work in connection with a city improvement eme. The chairman, in replying, said that, owing he absence of the president, Sir William Arrol, who attending to his Parliamentary duties, he had the honour preside for the second time at the annual dinner. Sir es Bell, Lord Dean of Guild, who was unable to be present his occasion, when Lord Provost of Glasgow presided over opening meeting, and he could never forget the closing ds of his inaugural address. He was kind enough to say such a body as they claimed to be, with the high objects set forth in the memorandum of association, could not fail to be successful, and so long as they kept to their high ideal of construction and building they had a right to expect the support of not only the architects, surveyors and clients, but of the whole community. The exchange was barely five years in existence, they were entirely free of debt, and both financially and numerically stronger than they had been at any time of their existence. Besides, the exchange prevented them living in cliques, isolated from each other, it had enabled them to show individually a little of that spirit of unity that brought men together, that made them march shoulder to shoulder, and led them to victory. They did not run the exchange for sentiment. It was a business enterprise, managed and conducted on business principles. Brains and skill were what they claimed for its members, combined with honesty of purpose in carrying out their contracts. The exhibition committee in his opinion wisely sent three delegates in the beginning of the year to the United States to see what they could learn from the past experience of the great Chicago Exhibition. He thought it would be well if the Municipality of Glasgow were in closer touch with the architects, surveyors and the Builders' Exchange in erecting all public buildings. A better understanding would be brought about, and in these days of fierce competition and Employers' Liabilities Bill clauses adjusted, the real meaning of the contract could be embodied in specifications that would be far more equitable to both client and contractor. There were a thousand other matters. There was no lack of work for them—wrongs to be righted, crooked paths to be made straight and misunderstandings to be cleared away. That, however, was not the time or the place to enter in detail upon such matters. He only wished to impress upon them that they must be always up and doing, advancing on the broad lines of progress, growing in strength with every difficulty they encountered. They must have the interest and active co-operation of every individual member.

DOCK SHEDS.

A MEETING of the Mersey Docks and Harbour Board was held on February 23 for the purpose of considering the proposed outlay on docks and sheds. The works committee recommended that the south end sheds should be contracted for as designed by the engineer; that was to say, they should be two-storey sheds, which it would be possible to raise to

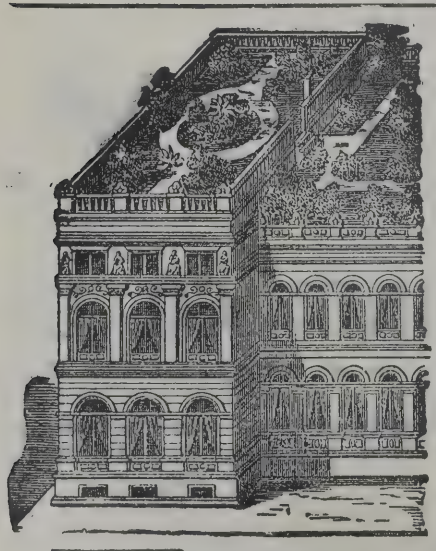
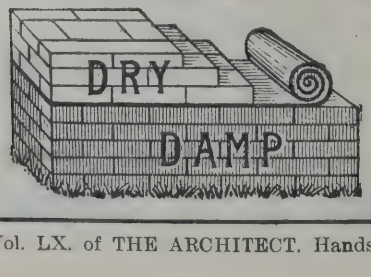
three or four storeys at some future time should it be thought expedient to do so. The contract was made in the first instance for two-storey sheds only. As to the north end, the view of the committee was that at the moment it was not necessary to come to a final decision, but that meanwhile the engineer should prepare the foundations at the Huskisson Branch Dock for sheds of three storeys and at the Sandon Dock for sheds of four storeys. The proposed new sheds at the north and south docks would on their different floors give an additional 32 acres of shed space, and when it was remembered that they could put on to an acre over 5,000 tons of grain or 5,000 bales of cotton, the conclusion was arrived at that 160,000 bales of cotton or 160,000 tons of grain might at one time lie on the quays in question. In this way those proposed additions to the present dock estate could in thirteen weeks take all the cotton that came to Liverpool in a year, and in another thirteen weeks all the grain that came to the port, leaving twenty-six weeks in the year during which they might remain idle.

Mr. Barrow said they already had a very fine example of the excellent work done by two-storey sheds with a crane on the roof. The engineer had given them plans of a two-storey shed with a flat roof, on which a crane was to travel about, and had suggested that they might bring merchandise from a ship's deck on to the flat roof and store it there. The scheme looked ingenious, but he doubted whether it would stand the test of practice. He would like to see one shed constructed in this way as an experiment, but he questioned the wisdom of going beyond the present two-storey sheds, which worked so well, until they had had some little experience of the proposed new arrangement.

Mr. W. Adamson felt that to provide sheds differing from the existing two-storey sheds at Toxteth would add very materially to the difficulties of the port. If they were going to have two-storey sheds with a flat roof, how was the second storey to be lighted? He was told that there would be some glass put in, but what strength of glass would bear the weight that was suggested to be put on the flat roof? As to the importance of light he might mention that during the past fortnight a steamer arrived at the south end with 33,710 packages. There were 119 different marks on fifty-six bills of lading, and how, he asked, could they select those marks if there was a flat roof with no light getting into the second storey? It would be an utter impossibility.





Mr. Walter Glynn said he could not see how they were going to get the goods away from three or four-storey sh There would be a block in the matter of cartage, and t would be unable to get the goods away in anything like de time. The two-storey sheds had been a great success, and had always been in favour of them. If they went beyond he thought they would incur a cost from the shed which t would find would not pay them in the end.

Mr. H. R. Robertson said he was sorry the works commi did not recommend three-storey sheds He had no doubt double-storey flat-roofed shed would prove very efficient, bu the same time he thought a three-storey shed would be m more useful. This matter had been discussed by the tr committee, and the members were in favour of the three-st shed; in fact, some of them favoured a four-storey shed on north side of the Sandon branch dock. He thought it w be wise to make an experiment with a three-storey shed at point. One advantage of a three-storey shed would be with the large size of vessels now in vogue and the large car they delivered, more facilities would be given for sorting getting quickly rid of the cargo. As chairman of the tr committee he did not think he should make these rem without saying that their superintendent did not believe double-storey sheds would be sufficient for all their req ments Notwithstanding that he (Mr. Robertson) thoug third floor would give great facilities for sorting cargo, an would rather see a third storey than a flat roof. Howeve preferred the flat roof to continuing the old double-storey s

Mr. Woodward favoured the idea of having one flat-r double-storey shed as an experiment. There was nothi prevent them roofing it over afterwards if they found it w failure.

Mr. T. Rome said he was in favour of trying a four-s shed. As to the proposed shed on the south side of the Sa Dock there was no necessity at present to decide what h it should be, and he thought the works committee might well be asked, before definitely fixing the type of shed at spot, to consider whether or not some design of four-s shed or three-storey shed might be adopted. While he tho that the idea of the flat-roofed shed was very ingeniou considered it was not quite practicable. By going on wi trying anything but double-storey sheds they were mak great mistake, and he thought the increase in the amou goods requiring to be handled was a strong argument in fa of the view he held, which was that they ought to increas accommodation on that dock quay.

PATENT
VULCANITE ROOFIN

Since the introduction of the patent Vulcanite Roofing into this country it has be by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter than under any other roof. When properly laid repairs are never required, and al guaranteed. The roof-surface can be used as a garden, or for any other purpose. construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any wid inches, being more convenient than the usual damp-course slabs, and saving laps. Price quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., SARKING under slates or tiles, manufactured in five different qualities and in rolls c ficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, & re Sheet Asphalte, free.

Mr. Bibby said that, so far as he could see, there was no estion of light involved in the erection of double-storey sheds th a flat roof.

Mr. W. P. Sinclair said he should like to know the differ- ce in the cost between a two-storey shed of the ordinary type, double-storey shed with a flat roof and a three-storey shed. e thought they must put a four-storey shed out of their mind the present. As one having some experience in dealing h large packages of heavy goods, he thought that a three- rey shed and especially a four-storey shed would not be so eful as might be imagined for goods such as those huge xes of bacon and other articles which were brought in such antities by cargo steamers to that port.

The Chairman said there appeared to be considerable riety of opinion as to the class of sheds which should be ected. There was no immediate necessity for making up eir minds except in regard to the foundations. If they wanted er awhile to raise their two-storey shed to three or four reys they must have foundations sufficiently strong to permit it being done, and as they were going to commence immedi- ly the engineer must be instructed as to the nature of the ndations which he was to put in. It was all very well to fill ge sheds, but the stuff must be taken out again, and they ght have to extend the time limit for consignees to remove ods beyond the seventy-two hours at which it was fixed at sent. If they extended that time limit they were going rilously near making these sheds into warehouses, and that s what he was afraid of. He thought there were a great ny operations on the quay at present which ought to be per- med in the warehouse, and for anything they might do to apen the cost of transit to the warehouse they should get a *id pro quo* in getting their goods removed and their vessels charged without the bustle and hurry and the mistakes and inders which were necessarily connected with the present te of matters. For all these reasons he should be rather in our of sending the proposal as to double-storeyed flat-roofed eds back to the committee for reconsideration.

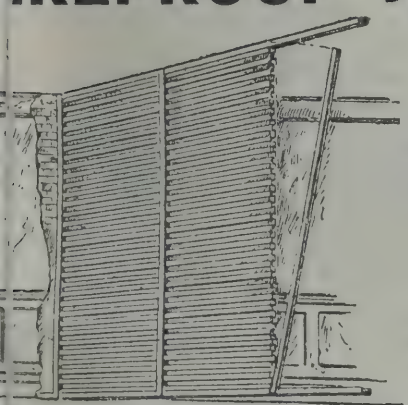
Mr. Hughes, replying to the question of Mr. Sinclair, said understood the cost per superficial yard was much the same the various kinds of sheds. That was to say, a double- rey shed cost twice as much as a single-storey shed, and a ir-storey shed would cost four times as much. If a com- etely equipped three-storey shed cost, say, 7*l.* 10*s.* a yard, a uble-storey shed, with flat roof, would cost 6*l.* 15*s.*

The recommendations were adopted.

PORTLAND CEMENT.

THE following conditions are enforced by the Russian Government in selecting Portland cement :—

1. Casks of cement furnished for building purposes are to be of uniform weight, say, 180 kilos gross and 170 kilos net. That upon each cask be plainly stamped the trade mark of the factory and the weight, both gross and net. That the loss of cement from spilling and for difference in filling casks should not exceed 2 per cent.



2. Cement intended for building purposes should always be of the slow-setting kind, for such cements are more easily worked, are more reliable and possess greater power of adhesion. Cement is considered slow setting when it does not set before the expiration of three-fourths of an hour after mixing the paste. Portland cement hardens more slowly as the temperature falls; therefore, to avoid misunderstandings, all tests should be conducted in a room having a uniform temperature of 15 to 18 deg. Centigrade, and only water of about the same temperature should be used. During the process of setting slow-hardening cements generate but little heat, while with the quick setting a considerable rise of temperature may ensue. To ascertain the time of setting, a cake of pure cement, prepared upon a glass plate, is taken. After the lapse of the above-mentioned time this cake must have acquired such a degree of hardness that the passage of a finger-nail gently grating it should leave no trace and no water ooze out when the surface of the cake is lightly rubbed.

3. A cement cake prepared upon a glass plate and immersed in water some time after setting should, after remaining under water twenty-eight days, show no cracks or warping on its edge.

4. Portland cement must be milled into as fine a powder as possible. After passing through a sieve of 900 openings to the square centimetre there should in no case remain upon the sieve a residue exceeding 20 per cent.

5. The adhesive power of Portland cement is determined by submitting to tests of rupture a mixture of cement and sand, seven and twenty-eight days after making the mortar, and also the pure cement after seven days. The tests must all be made with the same apparatus, with samples of similar section, in an identical manner. For normal tests normal sand is employed, prepared from natural quartz sand, which is passed through a series of sieves and washed. The section of samples at the point submitted to rupture must be 5 square centimetres. In

making samples, all their component parts must be taken by weight.

6. A mixture of one part of cement to three of normal sand twenty-eight days after setting must bear, as its minimum power of resistance to rupture, a strain of 8 kilograms to the square centimetre. Normal sand used in massing samples is prepared thus :—A quantity of natural sand is passed through sieves of 64, 121 and 225 meshes to the square centimetre. Next, the portion which shall have remained upon the sieve of 64 meshes, and that passed through the sieve of 225 meshes, are thrown away, and the sand remaining on sieves of 121 and 225 meshes is mixed in equal parts; this mixture constitutes normal sand. To make cement paste or mortar, water is added in the proportion of 50 per cent. by weight of pure cement, or 12½ per cent. by weight of the dry mixture of cement and sand. This rule is to be applied if the manufacturer whose cement is being tested does beforehand state what proportion of water is best used with his cement. To attain all possible uniformity of quality, in cases where cement of the same brand is received in several lots, tests of pure cement are made.

In choosing cement for construction preference is given to that factory whose cement, all other qualities being equal, gives the greatest resistance to rupture after seven days tested pure. Pure cement after seven days must, when tested by rupture, bear a strain of no less than 21 to 25 kilograms on the square centimetre.

In preparing samples out of pure cement, water in proportion of one-third of the weight of cement is added, *i.e.* when the process by absorption is used. Samples intended for testing must remain exposed to the open air during the first twenty-four hours after they are made, and then be kept in water till the moment of being tested. At each stage (seven and twenty-eight days) of the experiment, ten briquettes must be broken when testing cement of an unknown firm or brand for the first time; for cement of a known brand at least five briquettes are necessary. When the normality of a cement is determined in a laboratory then simultaneously with the test after twenty-eight days, a test of the mortar after seven days must also be made, and the ratio of the two determined. It is necessary to know this ratio when making quick control tests. Mortar consisting of one part cement and three parts of normal sand must have a tensile strength after twenty-eight days of 8 kilograms on the square centimetre, or, after seven days, of not less than 5 kilograms to the square centimetre.

7. All the tests enumerated in the preceding rules determine the normality of a cement of a given brand. For cement of a known brand, in order to save time (especially when tests are necessary at the location of constructions), control tests are allowed to determine (*a*) the time of setting; (*b*) the property of briquettes made from pure cement to remain free from cracks and warping during seven days; (*c*) the fineness of the grain; (*d*) the resistance to rupture after seven days of pure cements and mixtures with sand. The resistance of a mortar composed of 1 part of cement to three parts of normal sand, seven days after being mixed, must in no case be less than 6 kilograms per square centimetre. Should the cement respond to all requirements from *a* to *d*, excepting *d*, then the tests may be adjourned for twenty-eight days, when the cement must undergo all the tests provided for in rule 6.

LABOURERS' COTTAGES.

A correspondent of the *Manchester Guardian* writes :—

During the past few years I have, off and on, been making inquiries into the question of English cottages in country districts, and latterly I have given considerable attention to it. A few observations therefore may perhaps be permitted in support of the contention that, except on the larger agricultural properties, labourers' cottages are anything but what they ought to be. I start with the assertion that such cottages should possess three bedrooms upstairs (as on the Duke of Westminster's estate, for example), two at least of which should have fireplaces; that downstairs there should be a good living room (or kitchen), a second room as a "best" one, and a scullery, unless the last is in one of the outhouses (which it sometimes may be to advantage); that every window in the house should be made to open; that there should be not less, if possible, than a quarter of an acre of garden ground to each cottage; and that for offices or outbuildings there should be a washhouse (with copper and grate), a coalhouse and a closet, fitted preferably with an earth pail. Now let us describe a few cases which are fairly typical of the inferior character of country labourers' dwellings. There are many even worse. In the little village which I have in mind, and which is not a hundred miles from Manchester, several of the cottages are of two to three rooms in all. Each room averages not more than 10 feet in length by the same width, the ceilings being extremely low. As one looks at these cottages from the street (it is an open village, *i.e.* a village in which the houses are owned by several different

persons) he perceives a front door which is not as high as any ordinary erect person, whilst the woodwork of it is warped with age, is unpainted, and fails to keep out draughts. The front window is some 2 feet 6 inches high by 1 foot 6 inches in width. It does not open. The back room downstairs is, if anything, smaller than the front one, and possesses no better door or window. There is scarcely space in either room in which an ordinary family can turn when they are all at home; and at meal times it is quite impossible for all to sit down together at table. There is no arrangement downstairs (either in or out of doors) for washing the clothes, such as a copper; nor is there a pantry or larder, but an apology for the same in an isolated shelf or two. In the rear of the house is a small and filthy privy, common to several households. Slops and other refuse are thrown out at the back, and as there is (except for an occasional cesspool close to the back door) absolutely no drainage system, all matter which should drain away artificially must mainly drain away by percolating through the soil. At the back, too, is no garden on which to use the refuse, but simply a dank, wet piece of ground about as big as that on which the house stands. Upstairs there are sometimes one and sometimes two very small rooms. The one window in each is smaller than those downstairs. The ceiling is extraordinarily low, and before morning the atmosphere, in spite of the draughty window and ill-kept roof, is simply abominable. Whole families live in these dwellings, and there are always, it seems to me, ill-health and fevers in the place. In Lincolnshire and East Yorkshire ladders are frequently used in place of staircases. In Derbyshire, Staffordshire and Lincolnshire there are large numbers of four-roomed cottages. In these cases one of the two bedrooms is always very small, and, apart from all questions of drainage, it is clear that there is not enough decent accommodation for a family of five to eight persons (often more). In other cases (in Bedfordshire, for instance) there are several two-roomed dwellings. The living-room is less than 12 feet square, and there is a bedroom over it of the same size. Large families occupy these cottages. In certain other villages are cottages standing a little way back from the street which, though inhabited, are utterly unfit for habitation; the people who live in them look as wretched as the houses, and, in short, the districts remind one of the worst of the congested districts of Ireland. In two other villages near the former matters are even worse, for the dwellings are but hovels, having no back-way, and with the privies literally in the street.

If the dwellings described are typical, surely something needs to be done to alter such a state of things, for it must be remembered that where these dwellings exist there is always more or less disease, and frequently heavy mortality from diphtheria and fevers.

SMOKE AND FOG.

In the course of a Royal Institution lecture on "Coherers," Professor Oliver Lodge made an experiment which may have an important bearing in the abatement of the smoke nuisance. He filled a bell-jar with magnesium smoke. Ordinarily these thick fumes would take a long time to disperse. Dr. Lodge passed a charge of electricity through the jar, and the smoke began instantly to clear, the smoke particles uniting and falling in the form of a white snow of magnesia. The word used to describe this action of the smoke particles is electric "cohesion" The explanation of it, Dr. Lodge said, is beyond our scientific knowledge, and it is one of those great problems of electricity which we hope that Lord Kelvin may solve. It is perhaps enough to say at this point that it is this quality of electric cohesion which makes Hertzian wireless telegraphy possible—by the use of sensitive electric devices called "coherers," which, like the receiver of a telephone, serve to indicate certain forms of electric waves. But Dr. Lodge incidentally referred to a possible extension on a large scale of his magnesium smoke experiment. "Some people," said he, "may imagine that this experiment suggests a means of dispersing London fog. An adaptation of some such method might be suitable for the dispersion of real fog, of sea fog, of fog arising from a moisture-charged atmosphere. A Scotch mist can be turned into rain by a suitable discharge of electricity, and ordinary rain can be changed into the large drops of a thunder shower by the electric discharge of the lightning flash. The reason for the size of the drops is that owing to the incident of electric 'cohesion' the drops are attached to one another and form conglomerate drops. But I don't think electricity could prevent London fog. The only way to prevent a London fog is not to cause it. And the way not to cause it is not to burn coal fires, like savages, in open grates. The day will come when it will be forbidden to import crude coal into London. I confess I should like to see the experiment tried of making gas at the great coal fields, and of

conveying it to the town in huge pipes and conduits. The experiment, of course, could not be made with respect to London; it would have to be conducted on too large a scale; it might be tried with a small town. It would have to come to that some day. People say that they can't bear 'gas stoves.' But as a matter of fact all fires are gas stoves. People make the gas themselves, and make it badly. No doubt, however, the gas stove of the inevitable future will be a very different contrivance from that of to-day."

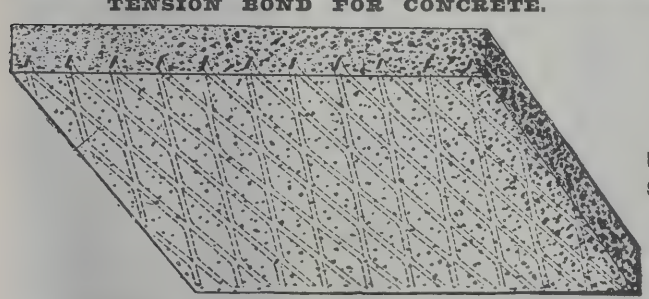
THE WORKMEN'S COMPENSATION ACT.

AT the Sheffield County Court Judge Waddy, on learning that three claims under the Workmen's Compensation Act were down for hearing, said he entertained a very strong view indeed that this Act was doing damage to the unfortunate workman, instead of doing good. He should be very glad if the solicitors practising in the Court would tell him whether their own practice confirmed this opinion, because if it did he ought to make representations. Were they turning back cases in consequence of the somewhat peculiar restrictions of the Act, such as those as to the height of chimneys, the question of scaffolding, and so on? Two of the solicitors in Court said that for one case brought before his Honour under the Act two were turned away, and the judge replied that the Act did absolutely nothing for working men which was not done by the old Employers' Liability Act and the common law, and working men were being driven back to them because the new Act was so full of restrictions.

At the annual meeting of the Leicester and Leicestershire Trade Protection Society—which represents many thousands of the manufacturers and traders—special allusion was made to the failure of the Compensation Act. The committee reminded the members that it had been promised that the Act would simplify the law of employers' liability and decrease litigation. But already many cases had been brought before the courts, and some of them had been carried to appeal. The result showed that the meaning of the Act was in some respects not as clearly understood as it was supposed to be, and that more difficulties were likely to arise in its interpretation than were experienced in regard to former Act on the subject. Mr. Alderman Wood, the president of the Harborough Division Liberal Association, in moving the adoption of the report, complained that the Act was creating a great deal of work for the lawyers and the law courts, and pointed out that an early amendment of the Act was necessary.

MUNICIPAL TRADING.

THE following memorial has been addressed by the Council of the Society of Arts to the Home Secretary:—



"Sir,—The Society for the Encouragement of Arts, Manufactures and Commerce have been giving very careful consideration to the increasing tendency of municipal and local authorities to embark in trading enterprises which may be in competition with, or to the exclusion of, private enterprise, and they have had forcibly impressed upon them the fact that as yet no limitations have been defined as to what enterprises should in the general interests of the nation be undertaken by municipalities and local authorities and what ought to be left to private effort.

"They therefore venture to approach you in the hope that you may see fit to advise Her Majesty to appoint a Royal Commission to consider the whole subject, and to lay down the principles and limitations on which Parliamentary powers should be granted to municipal and local authorities. They further venture to submit that until such Royal Commission has investigated the subject and reported thereon, no further powers for trading purposes ought to be granted to such bodies.

"We have the honour to be, Sir, your obedient servants,
"J. WOLFE BARRY, Chairman to the Council.
"HENRY TRUEMAN WOOD, Secretary to the Society."

At the instance of the Liberty and Property Defence League (7 Victoria Street, S.W.) the following petition to both Houses of Parliament has been signed by railway, tramway, gas, engineering, electric lighting, water, &c., companies, by chambers of commerce, and by associations of employers, traders, property owners and ratepayers throughout the United Kingdom:—"That, inasmuch as numerous local Bills are now before Parliament containing further and novel provisions for municipal trading, to the risk of ratepayers, the injury of traders, the checking of private enterprise and the arresting of national progress, it is desirable, before such provisions are sanctioned by the Legislature, that a committee of both Houses, or a Royal or other Commission, be appointed to define the extent to which municipal trading should be sanctioned by

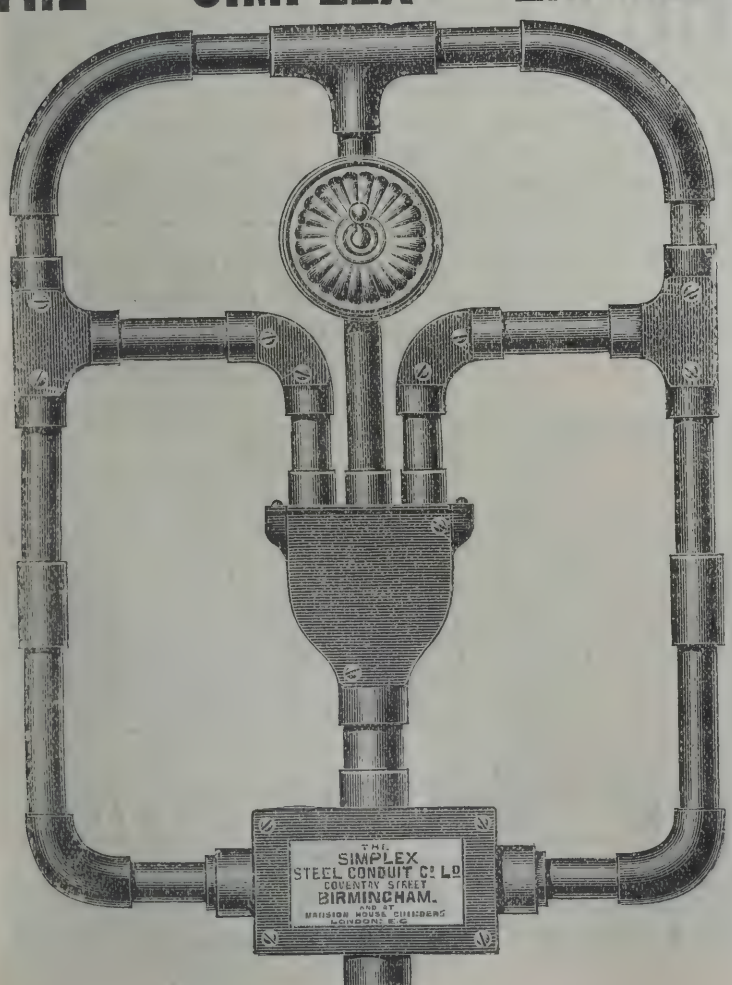
Parliament, and that meantime all provisions in local Bills for the extension of municipal trading should be suspended until such committee or Commission has reported thereon. And your petitioners pray that your honourable House may be pleased to appoint a special committee, or to obtain the appointment of a Royal or other Commission to define the extent to which municipal trading should be sanctioned by Parliament, and that your honourable House will meantime postpone the consideration of all provisions in local Bills for the extension of municipal trading until such committee or Commission has reported thereon."

BUILDING IN NAPLES.

It will be remembered that after the cholera epidemic of 1884 the enthusiasm of the public in Naples was aroused, says the British consul, by Signor Depretis, the Prime Minister of the day, by the celebrated phrase "Naples must be disembowelled." The Central Government granted 100,000,000 lire (4,000,000*l.*) towards the public works required. Sundry private building societies set to work, and an enormous number of large houses to be let in flats were constructed. The city was so overcrowded that there was no doubt a great deal of room for expansion, and things went well for a time, no great difference being observable in the rents of houses or in the demand for them. An important factor was, of course, the large number of houses pulled down for street improvements, which dislodged many thousands of the poorest inhabitants of the city. Speculators were consequently encouraged until the building became overdone. They then offered their new houses for one year only at very low rents, in order to tempt the public. This policy combined with the crash in the building speculations in Rome brought down the largest of the building societies, the preposterous rents of old houses fell, house owners complained bitterly, and numbers of houses both new and old remained alike untenanted and unsaleable. Although the crisis is far from being over, there are signs of a recovery, and many new houses are being built in the better parts of the town. The large area reclaimed from the sea at Santa Lucia is still undisposed of, the first concessionnaires having forfeited their caution money rather than handle a dangerous speculation.



A very brisk trade has been done in sanitary appliances and drain pipes, and in exporting these from England it will be wise of the trade to remember that, as we have no frost to contend with here and an abundant water supply, the cheaper kinds of syphon closets are more readily saleable than the more expensive ones. The pressure exerted by the public opinion of British travellers in these matters has caused a great awakening in Naples to the importance of sanitary matters, and all the chief hotels here are fitted with the very best apparatus. The same thing may be said of many private houses. In a recent case a gentleman here imported direct fourteen of the best English closets on the flush principle for his own house, besides many lavatories, urinals and several of Crapper's well-known ventilators for his sewers. Whatever may be the case in other articles of commerce, there can be no doubt that Great Britain is the pioneer in sanitary appliances, and that the foreign imitations of our apparatus are nearly always failures. There is a great demand in Italy, which our manufacturers should hasten to meet, and it would be advisable to stamp upon the supply tanks the minimum number of feet (or better still of metres) which should intervene between the tank and the closet in order to secure adequate flushing. This depends no doubt partly upon the size of the tank, but in no case should the fall be less than 8 feet. The pipe leading to the supply cistern should also be large enough to fill the cistern in a minute and a half, instead of three minutes, which is the time usually employed.

SANITATION OF THEATRES.

A paper was recently read before the American Public Health Association by Mr. W. P. Gerhard on "Theatre Sanitation," from which the following observations are taken :—

Drainage.—In arranging for the drainage and sewerage of a theatre building the general rules as to size and material for the sewer lines, the grade to be given, &c., should be followed. As a rule, the area covered by a theatre is so large as to require at least two 6-inch sewer connections. Proper attention should be paid to proportioning the sizes of the rain-water conductors which drain the roof surfaces over the stage and the auditorium, which latter are at times very extensive. All areas and courts should be properly paved and drained. A difficulty in the way of drainage often arises from the considerable depth to which that portion of the stage house known as the under stage has to be carried. Owing to the requirements of stage traps and stage machinery, the level of the under stage

is frequently located below the level of the sewer in the street. Any subsoil water accumulating in the sump must be removed by lifting same by means of either automatic cellar drainers worked by water pressure, or steam ejectors, or electric centrifugal pumps. Often the entire subcellar is constructed perfectly watertight, like the cellar of a warehouse situated below tide or subsoil water level. This not only keeps out the subsoil water and prevents dampness, which is undesirable for the stage house, as it would tend to ruin the stage flooring, the stage properties and the actors and supers' costumes, but it also prevents ground air from rising upwards, and tends to keep the air of the stage pure and wholesome.

Plumbing.—In recently built theatres of cities where plumbing rules and regulations are enforced, the soil pipes and waste lines are carried full size up to the roof and the fixtures are separately trapped. Generally, however, the plumbing is of the plainest kind, and without any attempt at elaboration. On the other hand, the plumbing of theatres in smaller towns exhibits often the worst defects imaginable, the entire work being carried out in a slipshod manner, the water-closets of dressing-rooms being generally set on dead ends of drain lines, having no soil pipe extension to the roof and often being a part of the dressing-rooms, partitioned off only by thin board partitions. Basins and sinks are often in direct connection with the sewer, traps being considered a superfluous and altogether too expensive refinement for such a building. In dark corners dissued closets or sinks are at times discovered. Drains are laid in a haphazard manner, often sloping the wrong way. Tile drains and cement pipes are used where extra heavy cast-iron sewer pipes should be run; all manner of faulty joints are discovered, and in many cases the sewage drips on to the floor and becomes the cause of the annoying odours which so often greet the audience when the curtain rises. Pan-closets and ill-flushed hopper-closets are used, and the apartments in which they are arranged are found to be in an indescribably filthy condition.

It goes without saying that the plumbing of theatres should be planned and arranged with the same care as that of other public buildings. There should be toilet-rooms for each tier in the auditorium, entirely separate retiring-rooms being provided for men and women. Sufficient accommodation should be provided in that part of the stage house which contains the dressing-rooms for actors and actresses. In addition, there should be in the basement well-arranged and ventilated toilet-rooms for the stage hands, employés and the supers. The office of the theatre manager often has a separate toilet-room, and there is in larger houses a toilet-room adjoining the star's dressing-room. Near the engine and pump-room a toilet-room for the engineer and his help should be provided, and if there is in the front part of the house a smoking-room or refreshment-room, a men's toilet-room is arranged with urinals and lavatories.

Handsome, nickel-plated work with fittings does not seem called for in a theatre, except possibly in the toilet-rooms of the parquet and dress circle, or for the occupiers of the boxes in large opera houses; but, nevertheless, the entire arrangement should be in every way sanitary, and the best workmanship is required. Woodwork should be avoided for well-known reasons. The floors and walls should be rendered waterproof and non-absorbent; partitions between water-closets and urinal-stalls should consist of marble, slate or soapstone. Every toilet-room should have a window to the outer air, and in addition artificial ventilation by exhaust flues should be provided.

The closets should be of glazed earthen or vitreous ware, which will not craze. The type known as washdown closet is particularly adapted for the theatre, and the flush for the same should always come from a special copper-lined flushing cistern, though an automatic seat-flush may often be preferable, owing to the careless manner in which the public, as well as stage hands, use such places.

For the same reason it may be preferable to have porcelain urinal bowls with self-acting intermittent flush-tanks. In theatres in which spectacular plays or ballets are performed, requiring a large number of female supers and dancers, self-flushing urinettes or pedestal urinals for women may with advantage be provided, as the same require for connection to the sewer a 2-inch waste-line, whereas the water-closet requires a 4-inch soil-pipe.

All stage dressing-rooms should be fitted with small corner or wall lavatories, which must have both hot and cold water faucets, and each of which should be safely trapped, while the waste line should be extended to the roof for ventilation.

There should be a few slop sinks, both near the stage and in the public toilet-rooms, as they are required by the women scrubbing the floors for the emptying of wash water and to draw clean water.

Water Supply.—Theatre buildings require a very ample and large supply of water. There should be two entirely distinct systems of supply, one for fire protection, while the

second system provides water for plumbing fixtures, flushing, washing and general cleanliness.

The water supply for fire-extinguishing purposes embraces large suction tanks in the basement, roof tanks to supply the automatic sprinkler system, a powerful fire pump in the engine-room supplying the fire standpipes and fire valves, &c. This system has been elaborately described by Mr. Gerhard in his book on "Theatre Fires and Panics," to which those interested are referred for further details.

The house supply should be entirely separate, and where the street pressure is insufficient to supply the plumbing fixtures in the upper parts of the theatre, special house tanks should be provided on the roof over the stage. It will readily be seen that it would be inadvisable to use the sprinkler tank for such purpose, as it might be found empty when water is wanted for fire-extinguishing purposes. The rules of the National Board of Fire Underwriters wisely specify that no branch for sinks or for drawing water for any purpose whatsoever should be taken from the sprinkler-tanks. Sometimes house-tanks placed above the highest plumbing fixtures, for instance, on one of the upper flies or in the rigging loft, fill at night by pressure from the street mains; in the majority of cases, however, it is necessary to pump the water to the tank, which is accomplished by means of direct-acting steam pumps, or by electric pumps, or hot-air engines, or even windmills placed on the roof.

The house-water service comprises, further, a hot-water tank, because the players and supers require in their dressing-rooms hot water in abundance at the basins and wash-sinks to remove face-paint, &c. Hot water is likewise required at the slop-sinks for the use of the scrub-women.

Ventilation.—When new theatre buildings are to be erected architects should always associate with them an expert in heating and ventilation, which two problems always go together. It is necessary that every part of a theatre should be ventilated; not only the auditorium, but likewise the stage, the dressing-rooms, the under-stage, the engine-room, the vault where the gas-meters stand, and, finally, the numerous toilet and retiring-rooms in both parts of a theatre.

In designing a system it should be borne in mind that ventilation means not merely the removal of foul air, but simultaneously the introduction of a sufficient quantity of pure air, drawn from a suitable source out-of-doors, suitably filtered and warmed in winter time, suitably sprayed or cooled with ice in summer time, and introduced at all times without any unpleasant air currents or draughts. It is manifestly insufficient, then, to merely provide in the auditorium a few outlet flues and ventilating registers of restricted size for the removal of foul air, and to rely upon fresh air being drawn in through accidental openings or cracks or crevices, or from the level of the stage. In all cases both inlet and outlet flues of generous size should be arranged, and care should be taken that the same are in no way obstructed. There should be a supply of fresh air to each and every person in the audience equal to at least 30 cubic feet per minute, or 1,800 cubic feet per hour.

The fresh air may be introduced at the top of the house, through the ceiling, and made to move downward in a steady and uniform current, until it reaches the lungs of the spectators, and then removed at or near the floor line; or else air may be introduced at or near the bottom and exhausted at the ceiling of the hall. To a certain extent, either one of the systems may be successfully planned and arranged; the plan and subdivision of the theatre building, the details of construction and local conditions will generally decide the question. Where a theatre is lighted with electric lights the downward system of ventilation will show better results than where gas lights are used.

A good system of ventilation should effect a complete change of air three or four times an hour, and this change of air is required not only in the auditorium, but also for the foyers, the stage, the dressing-rooms and toilets.

The question of ventilation should always be treated in connection with the question of safety from fire. To depend, for example, for the ventilation of the stage upon a strong current of air from the stage toward the auditorium would be a grave mistake. For, with such an arrangement, in case of a fire on the stage—and it is proved by statistics that the majority of theatre fires have their origin on the stage—the smoke from the burning scene decorations, &c., would be drawn into the upper part of the auditorium and suffocate numberless persons in the gallery before they could make their escape from the burning building. On the contrary, the aim should be to create in such cases a strong current from the auditorium in the direction toward the stage. Doubtless this can be efficiently accomplished, and one way of doing it is to provide large ventilators in the roof over the stage.

There should be adequate actors' dressing-room accommodation, and these likewise require to be efficiently ventilated, preferably by windows to the outer air, or by special vent shafts where windows are out of the question. Finally, all toilet-rooms require a constant change of air and an abundant

supply of fresh air to keep them sweet and wholesome. Special stress should be laid upon the necessity of arranging for a current of air from the halls into the toilet-rooms, and not *vice versâ*; for otherwise, however good the system of ventilation may work, unpleasant odours from the water-closets and urinals will penetrate other parts of the theatre.

The boiler and engine-rooms should also have plenty of fresh air, and all building regulations provide that the vaults where gas meters are set must have suitable ventilation to prevent explosions of gas.

THE NEW HIPPODROME.

A HANDSOME building is now nearing completion at the juncture of the Charing Cross Road with Cranbourn Street. It is the new Hippodrome which has been erected from the designs of Mr. Frank Matcham, and is designed to seat about 2,000 people, approximately as large an audience as the Lyceum Theatre will hold, but, of course, so much space having to be set aside for the track and stage, the interior will be vastly more imposing. In the seating arrangements the plan is original. They will differ from those adopted in Paris. For instance, at the Nouveau Cirque there are six rows of fauteuils round the ring and fifty-six loges, or open boxes, each seating five persons, radiating from the circumference, above them being the "galerie promenoir." There is also a promenade, with a gallery, however, over it, at the Cirque of the Champs Elysées; but the Winter Circus has, with the exception of the loges over the entrance from the stables and the seats in a "tribune," all the accommodation in concentric rings, the lowest-priced admissions being those farthest distant from the "piste." Mr. Matcham appears to have retained the best features of each plan, but there will be no promenade. The stalls, or best seats, will surround the ring, except on the side occupied by the stage; around these and the fauteuils will be the boxes, on each side of the royal box; above these will be a large pit circle, *i.e.* a circle for "pittites"; over that again will be the "gallery."

Architecturally the hippodrome will be a conspicuous ornament to the Charing Cross Road. Here an immense tower is to be placed, with a skeleton iron cupola, surmounted by a chariot and horses in metal. Very shortly, the scaffolding being in course of removal, an idea will be gained of the principal elevation. The whole site covers the block comprised within Cranbourn Street, Charing Cross Road, Ryders Court and Little Newport Street, which is being considerably widened, and the hippodrome replaces a collection of hovels, and will, together with the two fine hotels that are completing in Leicester Square, greatly beautify the district. Stables for horses will be in the basement.

PATENTS.

The Architect.

THE WEEK.

THE late EDWARD GODWIN wrote a series of articles for *The Architect* on "The Architecture and Costume of Shakespeare's Plays," forming the most complete work on the subjects which exists. For the costumes of the Venetians who appear in "Othello," as for those in the "Merchant of Venice," he followed the drawings of VECELLIO, supplemented by the paintings of TINTORET, BASSANO, ZELOTTI and PAUL VERONESE. For the costumes of Cyprus, where the action of "Othello" mainly takes place, he suggested that they should resemble those of Greeks or Persians rather than those worn by Western Europeans. We know that GODWIN'S recommendations have had their effect on managers who have attempted Shakespearean revivals, and indirectly they have been useful abroad. It may therefore be interesting to note how "Othello" has been costumed for the version of the tragedy which is now being played at the Comédie-Française. All the dresses were designed by M. CHAINEUX. He assumes that the incidents occurred between 1505 and 1515, while GODWIN concluded that the time was in the spring of 1570, in the period when MUSTAPHA was about to attack Cyprus. M. CHAINEUX, therefore, has had recourse to earlier artists; CARPACCIO furnished the principal types, but in addition use was made of PERUGINO, PINTURICCHIO, SIGNORELLI, SODOMA, and, what is more remarkable, both DA VINCI and RAPHAEL were utilised. But, like GODWIN, he employed VECELLIO'S plates for the doge, senators, patricians of Venice, as well as for the Levantines, Dalmatians, Uscogues, Cyprians, &c., who are introduced in Act II. In England OTHELLO has appeared as a Renaissance noble, a nondescript Eastern and as a modern Arab. For M. MOUNET-SULLY'S raiment very many books of travel were consulted. The casque he wears on his landing at Cyprus is a copy of BOABDIL'S, which is still preserved in Madrid. But archæological research was not confined to costume. The fight between the drunken CASSIO and MONTANO is exactly in accordance with the rules of such old swordersas MAROZZO, BOLOGNA and St. DIDIER.

IF the Workmen's Compensation Act is to remain in force (and to the workmen it should be by this time as obnoxious as it was from the first to employers) a special dictionary of the English language will have to be prepared for the use of litigants. Who could have supposed that a mortar-mill can be transformed into a factory? Yet that is evidently the belief of the Court of Appeal. Hitherto a factory was supposed to be a building of some kind, it might be only a workshop, but when once a piece of machinery becomes a factory there is no knowing what results will follow in a legal sense. Workmen should be protected against dangerous machinery, but there are Acts enough in operation for that purpose, and there was no need to pass a special Act. Parliament did not anticipate that a mortar mill was to be considered a factory, and decisions should be given according to the common meanings of words which were in use whenever an Act was passed. In another case the question arose whether a wharf was a factory. The County Court judge decided in the negative; but the firm who would have to pay compensation decided on an appeal, but they asked for security that the costs would be paid. In opposition it was shown that under the Employers' Liability Act there was no necessity for such a security, and it was argued that, under the Workmen's Compensation Act, a similar arrangement would hold. But the Court of Appeal held that as the ordinary rule of the Court was that whenever the respondent proved that the appellant was a person from whom costs were not likely to be obtained, the Court would order security for costs. If the appellant happened to be in a position to appeal *in formâ pauperis*, security need not be given; but in that case the opinion was required that the case was a proper one for appeal. The decision will be unsatisfactory to claimants who have not the funds of a trade society at disposal, but unless something is done in carrying out the conditions of the Act the litigation will be endless.

THE announcement that the Town Council of Perth have offered 600*l.* for the "fair maid's" house will give rise to a desire that the negotiations will be successful. There is some truth of course in the legend which Sir WALTER SCOTT has immortalised, but the attraction of the house depends on its romantic rather than its archæological interest. SCOTT says that CATHARINE GLOVER, the reigning beauty of Perth, lived with her father in the Couvrefew, or Curfew Street. We are told that the street or row must, about the time of the story, have formed part of the suburbs, and that "the shops, as well as houses of the glovers, were then, as the name implies, chiefly in the Skinnergate; but the charters in possession of the incorporation show that the members had considerable property in or adjacent to the Curfew Row, consisting not only of fields and gardens but of dwelling-houses." The glovers were among the most esteemed of the Perth craftsmen and deservedly so, for on their seventeenth-century banner they had inscribed these words:—"The perfect honour of a craft or beauty of a trade is not in wealthe, but in moral worth, whereby virtue gains renowne." If the house was never inhabited by the lady-love of HARRY THE SMITH, there can be little doubt that it is ancient; moreover, the associations have so long surrounded it no logic will convince people that it is not the "fair maid's" house. It would be a loss to visitors from England and America if it should be demolished and a modern building substituted for it.

THE report of the committee of the London Chamber of Commerce on Secret Commissions will, no doubt, aid those who are endeavouring to obtain an Act dealing with the subject. But it is an evil which will be difficult to control. It is generally supposed that in connection with building illicit commissions are very common, but in the statements on which the report of the Chamber of Commerce is based there is no evidence to confirm that theory. For instance, it is alleged that "secret commissions are given by chemists to medical men on their prescriptions supplied to patients, in some cases amounting to from 25 to 50 per cent. on the price charged by the dispensing chemist." Happily no charge of that kind is made against architects. It is true that a firm who were correspondents of Sir EDWARD FRY stated:—"We have met with serious difficulties in connection with some architects, who will demand a commission from the manufacturers whose machinery is used in cases where they prepare the plans, and who get paid for the same by the owners of the property." But, as we pointed out at the time, architects do not usually give orders for machinery, and the cases in question must be exceptional, and particulars of them should be furnished. At all events, the London Chamber of Commerce have been unable to adduce instances in which architects were culprits. But they have rendered excellent service by endeavouring to throw a light on nefarious practices which are familiar to those classes of people who cannot trust for success to legitimate efforts.

ON Thursday next the jury will be constituted that is to judge the suitability of the pictures offered for the International Exhibition of 1900 in Paris. Ten years ago when the last exhibition was held there was only one society of French artists. As there are now two, the former arrangements cannot be followed. The Minister of Fine Arts has decided that the number of jurymen will be fifty six. The fourteen members of the section of painting in the Académie des Beaux-Arts have, as a matter of course, to be appointed. The two rival societies will each be represented by fourteen members. Finally, the Minister of Fine Arts, with the aid of his department, will select fourteen. In a French exhibition the award of medals and distinctions is generally considered as inevitable. But when the National Society was constituted, one of the resolutions was that the bestowal of rewards was to be avoided in connection with the annual exhibitions. The members will not therefore accept any medals from the Exhibition of 1900, although the majority of artists who are represented by works in the galleries are likely to adhere to the old arrangements.

REMBRANDT AT THE BRITISH MUSEUM.

IT was a surprise to LOUIS VIARDOT when in visiting England in 1843 he discovered that REMBRANDT was esteemed not less highly than POUSSIN, CLAUDE and MURILLO. If the excellent author of "Les Musées" could have lived long enough to see London in 1899 he would be still more amazed at finding two official exhibitions devoted to REMBRANDT, and, with a very few exceptions, each made up of examples of the master's works which were derived from English collections. The splendid drawings and etchings on view in the British Museum, which are transferred for the occasion from the Department of Prints and Drawings, is a testimony to the provident care of the Trustees, the liberality of donors and the anxiety of the officers who were the custodians. In Mr. CARPENTER'S days it needed uncommon courage to solicit the favour of studying prints and drawings, and before and after his reign the portfolios and cases were guarded as if the contents were too precious to be seen by any but an exalted few. Inconvenience may have arisen, for it is hard that a British citizen should be deprived of any of his privileges, yet we are afraid few people will sympathise with the victims when they see prints which remain as brilliant as if they were pulled from the press a few days ago. Pencil strokes which REMBRANDT may have applied as an experiment before altering a plate 250 years ago still retain, as it were, the expression of haste, and reveal momentary efforts to attain effect. There is so much of what under ordinary conditions would be evanescent that we seem to be gazing at studio secrets, at records of trials, at struggles which come from a conflict of ideas rather than at the wares of print-sellers. That at least has been our experience, and consequently we have found an attraction in the Museum exhibition which is not always afforded by the sight of REMBRANDT'S etchings in various states. At Bloomsbury we are brought nearer to the great artist, and in many cases can easily imagine what he said to his pupils and friends or to himself when he contemplated changes or encountered failures.

We cannot suppose his expressions were those of a meek and resigned philosopher when the first version of the *Descent from the Cross* failed in the biting through the inefficiency of the protecting coat of varnish, and had to be abandoned. REMBRANDT was to be excused if he used strong language, and it is to be hoped he has had as pitying an angel to record the offence as attended on Uncle TOBY a century afterwards. The plate is a sad spectacle, and regret for the catastrophe is increased when we perceive it would be superior to the second version. In one impression of the *Angel appearing to the Shepherds* Indian ink has been used to impart more shadow, while a copy of the *Chist before Pilate* is boldly touched up in oil colours, suggesting the haste of the master to express a thought in the readiest material which came to his hand. The removal of the whole of the figures, amounting to about a dozen men, women and children, that in four states of the plate appeared in front of the tribune in the *Christ presented to the People* is also, we suppose, to be taken as evidence of an angry mood. If REMBRANDT thought only of artistic effect he could gain his end without so great a sacrifice.

When we see such changes the question arises whether they do not help us to understand the origin of the etchings. Apparently all, or nearly all, were executed by REMBRANDT for his own satisfaction. Like lyrics, they expressed his moods, and they were dashed off while the inspiration was glowing. Elaborate plates, like the *Christ presented to the People*, the *Three Crosses*, the *Christ Healing the Sick* ("the Hundred guilder piece"), the *Resurrection of Lazarus*, were, we suppose, speculations like the modern etchings which are seen in so many shop windows. The portrait of COPPENOL, the writing-master, was probably a commission, and was intended to be used as an advertisement of the bullet-headed caligraphist who possessed so many styles of lettering at command. EPHRAIM BONUS may also have wished to bestow a portrait of himself and his big ring on the patients who promptly paid him his fees, and for that purpose employed REMBRANDT. JAN SIX looks too refined a gentleman to obtrude a likeness on his neighbours for the purpose of securing their votes. But after allowing for all the works which can be considered as ordered for purposes of business, we still have a majority which apparently came into existence for the gratification of the man who produced them.

An artist inspired by commerce alone would not waste his labour on unsuitable plates. In a *Virgin and Child* (179) the catalogue tells us, "The head seen upside down near the VIRGIN'S right knee indicates where a different design had been begun and abandoned." REMBRANDT in such cases would be piqued to overcome a difficulty offered by the material, just as MICHEL ANGELO was when he made the *David* out of a block of marble which another sculptor had operated on. In No. 229 we meet with a beggar man, woman and child along with a portrait of the artist. On another plate there are or were five heads. The large number of portraits of himself may also be taken as evidence that REMBRANDT was not always thinking of the market. To use WILKIE'S words when he posed himself as a model of the nude, and copied the reflection in a glass, they were "cawpital practeese," and, moreover, the heads amused some of REMBRANDT'S cronies. He used as many dresses and appointments as if he were an actor in a variety performance of his own composition. His head was always available, and he was indifferent to preserving it in a state of dignity. REMBRANDT'S mother was another model he was glad to employ, but he was always careful to suggest she was worthy of respect, and it was reverentially he also drew his father's likeness. It is well to bear these circumstances in mind when studying REMBRANDT'S etchings. In using a copper plate he was generally his own master, and could be as spontaneous or as wilful as he pleased.

In arranging his etchings several divisions can be adopted. Mr. SIDNEY COLVIN has chosen the simplest and most satisfactory, for he has endeavoured to follow a chronological order throughout. Connoisseurs will of course say there are so many undated examples that order must be hazardous, but as we see it carried out in the Museum gallery it is confirmed by the evidence of increased power which is apparent. If a work of art in a mysterious way impresses us with the spirit in which it was produced, there are few collections which impart so much delight as those of REMBRANDT. There could hardly be a more marked contrast than is presented between his etchings and the few modern English examples which Mr. COLVIN has introduced to illustrate processes. The latter are excellent, but the apprehension of criticism is seen in every line. The artists were not at liberty, and consequently each stroke appears as if doomed to demonstrate its right to existence. REMBRANDT, on the contrary was as it were always at play. The unfinished etchings reveal in some measure his mode of production, but in general it is impossible to tell where he began. As BASAN, the engraver, said, "REMBRANDT'S etching-needle was free and vagabond, every stroke was made to tell, and the picturesque disorder he affected to expend over a plate is the principal cause of the warmth, the harmony, the seduction of his prints." It is often difficult to say what was his intention. Sometimes it was manifestly the contrast between light and darkness, and he illuminated a crowd of figures regardless of their relative importance, or concentrated the light on one among them according to his pleasure. On the other hand, there are etchings so dark the figures are almost invisible and the subject has to be taken on trust. But as he was lord of his own actions it cannot be denied that his unbounded liberty occasionally became mere license. In spite of all that is said to the contrary, we consider the straight lines which traverse the *Three Trees* as no more than a freak, a daring freak, to show how interesting a landscape he could make in spite of obstacles however unnatural. The countless lines, which are nearly straight, that cover a large section of the *Three Crosses*, form a *tour de main*, for a machine could not produce them more accurately, but they are out of keeping with the character of the work in other parts of the plate. The aim was to diminish what would be an excess of white light, but that could be regulated by REMBRANDT with less mechanical aid if he had desired.

So many of the etchings represent simple subjects, it is easy to conclude that REMBRANDT did not differ from his countrymen who devoted themselves to representing peasant life. It is not accepted that in conception his *Raising of*

Lazarus (final state) is grander than the joint work of MICHEL ANGELO and SEBASTIAN DEL PIOMBO. The contrasts of character in the numerous groups seen in the plate *Christ Healing the Sick* are amazing. But there are simple scenes which are remarkable for subtlety. GOETHE'S essay on "Rembrandt der Denker" was inspired solely by the etching *The Good Samaritan*, of which copies in two states (No. 93) are in the exhibition. It represents the wounded man being carried from the mule into a house or inn, the Samaritan paying all charges in advance to the host. GOETHE praises the delicacy of the execution, but what struck him most was the conflict of emotions suggested by the figure of the invalid, who, recognising among the people in the background and at a window some members of the band by whom he was waylaid and attacked, is afraid to enter a place where they are found and yet is too helpless to resist. In size the plate is small, yet to GOETHE it was a "wichtige Blatt," and to observers who possessed equal insight and culture many of REMBRANDT'S etchings would be no less eloquent.

It has also been doubted whether REMBRANDT was competent to realise the beauty of the human figure. As a rule his men, women and children are overburdened with clothes of the artist's devising, and which are not of any use in exemplifying the variations of costume. His Dianas and Eves and women bathing recall the story of the French painter who was compelled to employ no other model than his wife, without any regard to the effects of years. Neither SASKIA nor HENDRICKIE STOFFELS could compete in contours with the Medicean Venus, but REMBRANDT no doubt imagined he could transform unpromising materials. The etching, *Negress Lying Down*, in the exhibition (294) reveals more sensitiveness to beauty of line than is found in the rest of his works, and on that account its genuineness must always be doubted.

Mr. COLVIN has divided REMBRANDT'S work into three periods, viz. 1628-39, 1640-49, 1650-61. There are no landscapes belonging to the first period, but subsequently country scenes appear to have attracted him, and several etchings are in the exhibition which can be identified as transcripts of real landscapes. It is remarkable, however, that he does not appear to have made any of the scenes a subject for the display of his startling effects of light and shade.

One of the causes of REMBRANDT'S popularity is the clearness and definiteness of most of the plates, and by which they become most suitable subjects for reproduction. For several years Paris has produced selections from the etchings which are as enjoyable as the originals, although the cost is infinitely less. The success of the exhibition at the British Museum should inspire English publishers to undertake a similar enterprise.

The drawings by REMBRANDT are not so well known as the etchings. The Museum collection can supply nearly one hundred. They testify to the power possessed by the artist of realising a scene without the need of making several trials. Few painters were so happy in decisive strength, for REMBRANDT'S first glance was sufficient to reveal to him all that a subject could afford.

Several etchings by his contemporaries are also exhibited. CALLOT'S *Miseries of War* will probably be considered as the most attractive. They have an historic importance which cannot be claimed for REMBRANDT'S works. They show some of the pride, pomp and circumstance of war, but they also indicate how thin was the division between soldiers and marauders. The punishments inflicted were terrible. CALLOT was able to crowd an immense number of figures into one of his plates, and his work is therefore as effective as any descriptive volumes. Among the Dutch artists JAN LIVENS is the most remarkable. He and REMBRANDT were taught by LASTMAN, and each exercised an influence on the other. Altogether the exhibition is creditable to the Trustees of the Museum and to the officers who carried out the arrangements.

A Memorial of the late Mr. George A. Spottiswoode is to be placed in St. Paul's Cathedral by the members of the Lay Helpers' Association for the diocese of London, of which Mr. Spottiswoode was chairman for a period of twenty-two years.

SYSTEMS OF DISTRIBUTING AND GENERATING ELECTRICITY.

By F. J. WARDEN-STEVENS.

(*Continued from page* 141.)

Gas Power.

GAS is perhaps the most interesting form of motive power, and it is being adopted for electricity works to some extent. Its use is perhaps in the experimental stage at present, but some very good results are being obtained, although there have been a few failures.

The satisfactory running of gas engines depends to a large measure upon the quality of the gas used, as also does the cost of working. The obvious course to take in adopting gas-engines is to use ordinary illuminating gas, and this is satisfactory; in fact, it is the best, leaving out the question of expense. At Belfast this course has been adopted, and although the plant has worked very satisfactorily, gas-power is not being used for extensions in the plant, steam being substituted. This may be explained by the fact that the cost of fuel in 1897 was 1·3*d.* per unit, the usual cost in a works of the same size using steam-power being about ·5*d.* per unit. The reason of this high cost is on account of the gas being purchased from the gas-works at roughly the ordinary price for lighting, so the result is only what could be expected.

Other sources of gas supply, apart from the town mains, must therefore be considered, and the general course is to use "Producer" gas. There are several forms of apparatus for making this gas, which, it may be mentioned, is comparatively poor in quality and useless for ordinary illuminating purposes, but is a good heating agent and is inexpensive.

The "Dowson" producers are perhaps the best known, but there are several other types including the "Mond." Dowson gas may be described as representative of the class. The producer consists of an iron cylinder which is provided with a steam-jet producing an air-blast at the lower part, a small boiler generating the steam. A deep fire of anthracite coal is started in the generator, and the lower doors opening on to the fire-bars are then closed air-tight. Steam having been raised in the boiler to a pressure of about 40 lbs. per square inch, it is turned on through a nozzle which enters the generator below the fire; this nozzle passes in through a bell mouth through which a draught of air is drawn by the steam blast. The gas now arising from the anthracite fire passes out at the hopper at the top of the generator, and is here set alight and allowed to burn until the flame assumes a deep orange colour; at this stage it is fit to be passed into the holder, and the hopper is closed by means of a lever. The gas then passes into the cooler (a vessel of sheet-iron having a large surface exposed to the atmosphere), from there through the hydraulic box, which further cools the gas and acts as a check valve in case of back pressure, through the main valve to the holder. The scrubbers are merely iron vessels containing respectively broken coke and dry sawdust, space for the passage of the gas being provided by means of perforated iron partitions. The coolers and scrubbers are all arranged in the open air.

Dowson gas is practically carbon monoxide, which is highly explosive, and when ignited in the presence of air forms carbonic acid. The gas is highly poisonous, and great care has to be exercised in providing good ventilation, and in making sure that the pipes are tight. The gas-holders should be of considerable size, as the quality of the gas will fall if there is a sudden increase in the demand on the producer.

Coke may be used instead of anthracite coal, but it does not give such good results owing to its being porous and allowing air to escape through it unburnt. There is little heat really lost in the "Producer," the gas produced representing the heat which was originally in the coal.

In estimating the cost of producing this gas, it must be remembered that in addition to the cost of working, the fuel for raising steam in the boilers must be considered, and also the cost of recharging the coke and sawdust scrubbers.

Up to the present, it must be said that to obtain gas of

uniform quality much more care is necessary than is required to produce steam at uniform pressure.

It may be of interest here to state that at Leyton, a much smaller works than Belfast, where coal is probably more expensive, even in the first year of running the coal bill was only ·51*d.* per unit, as against 1·3*d.* at Belfast. The total works costs in the first year of running were only 1·87*d.* per unit, as against 2·63*d.* at Belfast in the third year of working. The Belfast works generated double the number of units, and should have given much better, rather than worse, results. These figures show the great effect of substituting "Producer" for ordinary coal gas.

Gas-engines.—The gas-engine is so well known that very little description is necessary. It is an internal combustion engine; the mixture of gas and air is drawn in on one stroke, is compressed on the return stroke, ignited and expands in the next outward stroke and the results of combustion are expelled in the return stroke. Thus only one useful stroke is obtained out of four—that is, two revolutions in the usual single-acting type of engine. It follows from this that the running cannot be uniform without the use of heavy flywheels. The impulses at each explosion are quite noticeable in the fluctuation of an electric lamp, unless a large storage battery is used and the flywheels are heavy. In order to reduce the fluctuations when slow-speed engines are adopted, the dynamos are driven by belts instead of being direct-coupled. The slip of the belt minimises the effect of the explosions on the fluctuations of the lamps.

High-speed gas-engines are used in order to increase the number and lessen the force of the explosions and also double-acting and double-cylinder engines are employed for the same purpose.

The efficiency of a gas-engine is much higher than that of a steam-engine for several reasons. In the first place the pressure is higher, and consequently the range of temperature is greater, and, as explained already, this tends to high efficiency. There is no loss from cylinder condensation, as is the case with steam, the effect of which is considerable. Were it not for the fact that if left to itself the gas would produce such heat as to burn the cylinder walls and valves, much higher efficiencies than those at present attained would result, but a water jacket has to be provided to keep down the heating of the cylinder.

Against the advantage of higher temperature range there has to be set the lower mechanical efficiency, one stroke only in four being effectual, and in some cases an unduly high temperature in the exhaust caused by insufficient expansion.

Gas-engines are difficult to start, and auxiliary engines have to be used in the larger sizes. In electricity works the dynamos are sometimes used as motors to start the engines, but this is not a very satisfactory method in general. Compressed air is occasionally used, it being forced into the cylinders in a somewhat similar way to the action in a steam-engine for a few strokes until speed is attained, when the gas is turned on. Small electric motors are sometimes used to start the engines, and in other cases a hand arrangement is adopted.

The governing of gas-engines is carried out in two ways: by reducing or increasing the charge of gas, or by entirely cutting off the supply of gas for a stroke occasionally if the speed increases above a certain limit. Extremely good governing has been obtained in practice by this latter method.

It is necessary to provide some arrangement for silencing the exhaust, and this can be accomplished to some extent by allowing the gases to pass through a gradually enlarging pipe on its way to the atmosphere. Unfortunately there are few, if any, devices which act to a sufficient extent, and the exhaust of gas-engines is always noisy, and is liable to cause trouble on account of nuisance.

It must be remembered that gas-engines, especially when used with "Producer" gas, require frequent cleaning and repairs, and will not run satisfactorily if dirty. The valves become choked with carbonised oil, formed by the oil being burnt by the high temperature employed. These are serious disadvantages, when it is remembered that the chief requisite for electricity works is reliability.

Gas-engines worked with "Producer" gas are undoubtedly more efficient than any steam-engines, and it is only the added complication and the greater liability to break down which has prevented their use to a greater extent.

Dynamos.

Continuous and alternating current dynamos are really one class of machine; the first is arranged to give continuous current, and the latter alternating. The nature of these currents has already been described.

Dynamos of all types for electricity supply works are now made in very large sizes; the latest have been made up to 1,500 kilowatts capacity—that is, equivalent to about 2,250 horse-power, or sufficient to light 50,000 8 candle-power lamps. On the other hand, dynamos are made as small as 10 kilowatts for electricity supply works.

The dynamo, both continuous and alternating, is a machine by which electric currents are generated by the action of a magnet on a coil or coils of conductors. If one pole of a magnet is plunged into the centre of a coil of wire, although there may be no actual contact between the magnet and coil, an electromotive force, *i.e.* electrical pressure, is induced in the coil, and if the circuit is closed a momentary current will flow in one direction. When the magnet is withdrawn the current flows in the other direction. The same effect can be obtained if a coil wound on part of a magnetic circuit is rotated so that the magnetic induction through it is being varied continuously, and this is the form in a dynamo or alternator.

Alternating Current Dynamos.—The alternator is the simpler of the two machines. There are many designs, but it is not intended here to go into particular types deeply. The types of alternators can be divided into three classes—1. Moving magnets and magnet coils, stationary armature and coils. 2. Moving armature and coils, stationary magnets and coils. 3. Armature and magnet coils stationary, but part of the iron magnetic circuit moving, which varies the magnetism through the armature coils.

The first type is mostly used; its great advantage is that the armature coils are stationary, and no high pressure conductors are exposed. If as in type (2) the armature rotates, the current must be collected by means of collector rings and brushes. This necessitates exposed high-pressure metal, and there is danger of shock. Further, the armature is the weakest part of the machine, and it is yet further weakened if the armature rotates. The most mechanical type is undoubtedly the last named, which is called the "inductor" alternator. In this type the only parts which move are the "inductors," which are plain masses of iron that can be evenly balanced. It must not be imagined that these are the only classifications of alternators. They may be classified also as those which have air cores to the armature and those having iron armature cores. The differences between these types are very marked. The air-core machines have very little "self-induction." The effect of self-induction is to act as resistance to the flow of the varying current. It is like the inertia of a mass of metal which causes a resistance to any change of speed, whether faster or slower. The effect that this has on the alternator is that if a machine has a large self-induction, there is a large drop of pressure as the current generated increases, and consequently either the speed must be increased to bring up the pressure, or the strength of the magnets. Another effect is that this self-induction automatically protects the machine from the bad effects of short circuits, as the maximum current the machine will give is limited by the self-induction. It can thus be seen that it is desirable to have an air-core machine because of the good regulation, but the iron-core machine is less easily damaged by short circuits on the mains, &c. The air-core machines are considerably more efficient than the iron core, as energy is expended in carrying the iron through the cycles of magnetism due to what is called "hysteresis." There is a definite amount of energy lost per pound of iron every time the current in the coil, and consequently the magnetism, is reversed, but this loss does not occur in air, hence the advantage in the latter type. Of course this advantage is discounted somewhat by the fact that more energy must be expended in sending the magnetism of the magnets through the air than through the iron core.

One characteristic of the usual type of alternator is that it is always multipolar, and is of large diameter compared with the length. The reason for this design is that

certain frequencies are required in alternating current working. Every time a magnetic pole passes a coil the current rises and falls, and as a rise and fall in current is half a complete period or cycle, the number of cycles per revolution is equal to half the number of magnetic poles. Thus the number of cycles or periods per second are equal to the number of magnetic poles multiplied by the number of revolutions per second divided by two.

This number varies for lighting from 50 to 150 per second. Taking the latter number, and remembering that a large dynamo direct coupled to an engine cannot run at more than about 400 revolutions per minute, it can be seen that to obtain a frequency of 150 alternations per second 30 poles are required to the magnetic circuit. In order to space these round an armature the latter must be of large diameter; but each magnet need not be very wide, and in consequence this dynamo would need to be of large diameter and narrow.

It will be seen later that continuous current machines usually consist of two magnetic poles, and the reason is that as the current is continuous, periodicity or frequency does not enter into calculations.

Every alternator must have a magnetic circuit, and because permanent magnets would, if powerful enough, be heavy and expensive, it is now the invariable practice to use electro-magnets. This necessitates a continuous current, which is usually provided from a small continuous current dynamo coupled either directly or by means of a belt to the alternator. The construction of continuous current machines will now be dealt with, and then the subject of the exciting circuits of alternators will be considered.

Continuous Current Dynamos.—The continuous current dynamo is exactly similar in principle to the alternating, with the addition of a commutator, which converts the alternating into the continuous current. There is practically only one general type of continuous machine, viz. the one in which the armature rotates and the magnets are stationary. It is possible to construct a machine on either of the three principles mentioned for alternators, but in all except the first method difficulties are experienced with the commutators and brushes.

Continuous current dynamos are usually two pole, and consist of one massive horseshoe shaped magnet with the armature rotating between the poles.

The voltage or pressure which any machine, either continuous or alternating current, will give, is proportional to the total number of magnetic lines of force all round the armature, the rate at which these lines are cut by any individual conductor on the armature and the number of conductors.

It may be well to explain what is meant by lines being cut by conductors. Every conductor around the circumference must have its axis nearly parallel to the axis of rotation of the armature, and is connected to another conductor, forming a loop. When this loop or coil is in such a position that all the magnetism passes through it, and the coil is moving in such a manner that the magnetism is decreasing, the conductor or coil is cutting lines of magnetic force, and also if the coil commences with no induction and moves so as to increase it, it is again cutting lines.

If two slip rings were connected to the two ends of the armature coil, alternating current could be collected. A commutator, however, is fixed to the shaft; this consists essentially of a tube split axially into two semicircular pieces, one connected to each end of the armature coil, the segments being, of course, insulated from each other. Two metal springs press on this split tube, on opposite sides, and are placed in such a position that when the current is at zero and reversing, the one half of the tube leaves the brush and the other half is connected. Thus, while the current in the armature is alternating, that in the outer circuit will be in one direction. With this elementary commutator the current would not be steady, but will rise and fall periodically, always keeping in one direction. These pulsations will occur twice in each revolution of the armature.

Suppose a dynamo to make 500 revolutions per minute, there would be 1,000 pulsations per minute, or 16 per second, which would be noticeable if used for lighting.

To obtain a practically steady current, the commutator consists of a large number of segments, each connected to a coil on the armature. By this means the pulsations are rendered more frequent but of less amount, and as a matter of fact the pulsations are inappreciable. Dynamos have usually from 50 to 100 segments on the commutator.

Details.—There is no need here to enter into the question of sparking on commutators; it is assumed that an engineer is in a position to insist on having dynamos which are practically sparkless. All first-class dynamos are practically as good as each other, and it is impossible to recommend one type more than others for use with continuous current systems. Given a strict specification and the power to enforce it, the least expensive should, as a rule, be obtained. The same, however, hardly applies to alternators. The most important points in connection with the construction of continuous or alternating current dynamos are mechanical strength and efficiency. A machine may be strong and inefficient or the reverse. Perhaps the latter is the greater fault of the two. Efficiency which is obtained by reducing air gaps and clearances between the armature and magnets, or by reducing the metal fixings of coils, is often met with, and is to be condemned. On the other hand, efficiency and mechanical strength obtained by almost wasteful expenditure of material and design are desirable in alternators.

In alternators the exciting circuit is supplied from a separate continuous current dynamo, often driven from the main shaft and sometimes from a separate engine, as previously stated, the latter being convenient when there are several alternators to excite. Exciters, connected one to each alternator, are very usual, as each machine is self-contained and switching gear for the exciting current is reduced to a minimum.

Continuous current dynamos are excited by two methods (1) by winding a fine wire coil of many turns and connecting it across the mains, or to the dynamo brushes, known as "shunt" winding; (2) by passing the main current through a thick wire coil around the magnets, on its way to the mains.

The former type is used for continuous current work for ordinary lighting systems, as by its use the pressure given by the dynamo if driven at constant speed will vary little with the output, the magnetism being constant. With the second type, called the "series," the magnetism increases with the current delivered, and consequently the pressure will increase as the current increases. This type is unsuitable for ordinary work, but it is used for exciting alternators to a large extent, as the current is kept fairly constant, and there is little chance of breakdown. Series-wound dynamos will not run in parallel, and this, again, unsuits them for use in electricity supply works.

Running in parallel means the use of two or more independent dynamos supplying one set of mains, and shunt wound machines will work easily in this manner. With continuous current dynamos all that is necessary is to run both machines until they give equal voltages, and then connect the two positive terminals together, and also the two negative terminals, when the load is shared between them.

With alternators, not only have the two pressures to be made equal, but the machines have to be running exactly in step—that is, the poles of the two machines must be passing the coils at exactly the same speed, and the coil and pole must be exactly similarly placed in each machine at the moment of connection. For instance, if in one of the machines the poles are exactly opposite the middle of the coils, then the poles must be exactly similarly placed in the other, otherwise there may be a short circuit on connecting the two together. Special apparatus has to be provided to indicate when these two conditions are satisfied, and the process of getting two alternators in step is called "synchronising."

(*To be concluded.*)

Mr. George Pearson died at his residence, Brickendonbury, near Hertford, on the 3rd inst., after an illness of several weeks' duration. Mr. Pearson was formerly head of the well-known firm of contractors, Messrs. S. Pearson & Son, of Westminster, a position which is now held by his eldest son, Sir Weetman Pearson, M.P. He was born in 1834.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Instftute was held on Monday evening last, at Conduit Street, W., Professor Aitchison, R.A., president, in the chair.

Mr. A. C. Dickie read a paper on

Some Early Christian Churches in Palestine.

The lecturer said that Jerusalem was rich in remains of early Christian churches, and he had selected for discussion three interesting types of plans which were comparatively unknown, viz. those of the church of St. John the Baptist (eleventh century), an Armenian mortuary chapel (sixth century), and the church of the Pool of Siloam (fifth century). Before dealing with these the lecturer briefly outlined the history and described the great cathedral church of the Holy Sepulchre, the most important and most interesting early Christian church in Jerusalem. Constantine, in the fourth century, built a basilica over the site of the discovery of the true cross by Queen Helena, and a rotunda over the Holy Sepulchre, which seems to have been separated from the basilica by a cloister. These were burned and destroyed by the Persians in 614, and partly restored by Modestus soon after, with the addition of a chapel over Calvary and a chapel to the Virgin Mary. Arculf (seventh century) gives a plan of the buildings, showing the rotunda isolated, and between it and the basilica the chapel over Calvary and the chapel of St. Mary. The buildings were again destroyed and restored in the ninth and tenth centuries, and totally destroyed in 1010 by the Khalif Hakem. Not long afterwards they were restored, and in the beginning of the twelfth century the restoration of the Crusaders made the church much as it is now seen from the housetops. The façade, with its domes and tower, and the Mohammedan minaret in the foreground, is the most charming group of the city; the rich tawny colour of the weathered stone and the lead and white domes set in bright sunlight against the intense blue Syrian sky is a picture to be remembered. The lecturer acknowledged his indebtedness for the facts given of the church to the careful researches of Mr. George Jeffrey, a fellow of the Institute. The church of St. John the Baptist lies on the way to the church of the Holy Sepulchre, in Christian Street, adjacent to the Pool of Hezekiah. Over the original church a modern one has been built, very nearly on the same plan, and the ancient building now takes the place of a crypt, the surface of the ground being at the level of the upper church floor. The lower church is reached by a rude flight of steps on the south side descending into a narthex, from which three doors enter the main building. The total length of the church north and south is 62 feet 9 inches, and width 24 feet 9 inches, which the later wall thickening has reduced to 16 feet 6 inches. The west wall of the narthex is 6 feet 10 inches thick. The floor of the eastern apse is raised 6 inches, and the original window is now formed into a recess. The present vaulting is Late Pointed, the centre bay having intersecting vaults and the flanking bays plain vaults. A close examination of the vaulting convinced the author that it had been constructed in the same way as the natives construct the vaults at the present day, viz. by a rude centring of timber, brushwood and earth, modelled to the form of the vault, and then completed in concrete of stones and lime thrown quickly over the centring and left to dry.

An Arab Effendi, when excavating the foundations for a new house, came upon one of the most beautiful Byzantine floor mosaics yet discovered. He preserved it by building a cell on the old foundations. The mosaic formed the floor of an Armenian mortuary chapel, a tiny rectangular cell 21 feet by 13, with an apse on the east end. The lecturer quoted Dr. Bliss's account of the discovery, and a note by Dr. A. S. Murray on the design of the mosaic.

Next to the church of the Holy Sepulchre, perhaps the most interesting is the church dedicated to the waters of Siloam in the middle of the fifth century. This long-lost ruin was discovered during the recent three years' excavation by the Palestine Exploration Fund under Dr. Bliss's direction. Having given a description of the Pool of Siloam and its present condition, and some account of Dr. Bliss's excavations, the lecturer went on to discuss the church itself. There is no record of any building attached to the pool prior to the time of the Empress Eudocia in the middle of the fifth century. The sacredness of its waters to the pilgrims who sought relief from their infirmities at its healing stream inspired the empress with the idea of building a place of worship over the pool. The plan adopted is unique. It consists of a nave and two aisles, measuring over all 86 feet by 52. In the centre of the nave are four piers, 4 feet 3 inches square, the supports of the Byzantine dome of a later restoration. The projecting choir is also of the period of this later work, as well as the thickening of the pier in the entrance colonnade to the north, inserted evidently to provide for the extra thrust of the dome arches. There is no entrance in the west, and access is gained from the north by a great stair of sixteen steps, 68 feet wide, descending through an arcade of seven arches almost the whole length of the aisle. The staircase is reached by three doors, entering from an atrium, the centre doorway being accentuated by the addition of a small portico. Between the doorways occur low stone benches set against the wall, used as seats. Ranged round the apse are five tiers of steps, with the centre raised at a higher elevation than the flanks for the seat of the bishop, as existing more or less complete at Torcello, illustrated by Fergusson. There is a small chapel in the east end of the north aisle, screened by a low screen of red marble 2 inches thick, let into the sill and walls, and coped with a moulded coping stopped by moulded stone gate-posts in the centre, the remains of which were found lying at this point. In considering the influences which had worked together to bring about the peculiarity of plan, the lecturer explained that the church was designed to fit into an existing scheme in the building of which no such extension was contemplated. At that time the pool was believed to be supplied by a spring, the builders being ignorant of the existence of the Siloam tunnel.

The position of the supposed spring to which the church was dedicated therefore fixed the position of the altar directly over the spot where the waters were believed to spring from, 27 feet below. This practically settled the eastern apse, and the west wall was fixed by the position of the rising scarp and city wall then existing, and forming the western butt of the great staircase, the necessity for incorporating the latter in the plan forcing the builders to draw the wall to within a few feet of the scarp, leaving a space only sufficient for a narrow passage and a western light to the church. It was desirable to have as much of the church as possible over the pool, and this was easily managed by carrying the south wall on the pool arcade and the aisle colonnade on the north wall of the pool. Thus the north was the only side available for the entrance to the church, and although the rapidly rising ground rendered this difficult, necessity demanded it, and the magnificent idea of a great staircase entering the north aisle through seven arches (almost its whole length) was the result. The traditional three doors were placed at the entrance to the staircase, and an atrium put in front.

Thus all the traditions of the early church plan were retained in a modified form—a most successful solution of an exceedingly difficult problem. An unsuccessful attempt was made to buy the site, with the intention of restoring the church and pool to its original state. Among the illustrations was a sketch restoration made by the lecturer founded upon the theories advanced in his paper. A careful study of the existing remains leaves little to conjecture, as the buildings practically stand for a height of 35 feet from the pool pavement to the ruined top of the church walls.

The Chairman said that, owing to the lateness of the hour, there would be no discussion. But he hoped that any of the members who cared to offer remarks on Mr. Dickie's paper would send them to the secretary.

A vote of thanks to Mr. Dickie was proposed by the hon. secretary and seconded by Mr. R. Phenè Spiers.

MADINGLEY CHURCH.

ON Monday Mr. G. J. Talbot, chancellor of Ely Diocese, completed at the Guildhall, Cambridge, the hearing of two petitions respecting Madingley Church. The first was presented by the Rev. T. A. Lacey, vicar, for a faculty confirming alterations that had been made in the church, and authorising certain alterations and additions proposed to be made hereafter; the second was by Mr. H. W. Hurrell, lord of the manor, for a faculty to remove a stone altar which had been placed in the chancel of the church. Mr. J. T. Micklethwaite, architect to the Dean and Chapter of Westminster, said the alterations had been made in the church according to his report. He designed the stone altar which took the place of the wooden table. There were stone altars in many parts of England. A stone altar was erected in Durham Cathedral a little before the Civil War. The altar in Westminster Abbey was a wooden table with a marble top. A screen would add to the beauty of Madingley Church. Mr. Hurrell said he gave up attending Madingley Church because he did not like the variety of things which were introduced in connection with the service. He objected to pictures and to a cross because it would lead to adoration. The Chancellor reserved his decision.

NOTTINGHAM ARCHITECTURAL SOCIETY.

DURING the past week the drawings which were recently awarded prizes by the Royal Institute of British Architects were, in accordance with an accepted annual custom, exhibited at the Nottingham Castle Museum and Art Gallery. The exhibition was organised by the Nottingham Architectural Society, and the works contained much of interest. They were hung in the Felix Joseph Gallery, and comprised drawings which were successful in competition for the Soane medallion,

the Royal Institute silver medal (measured drawings), the Pugin Studentship, the Tite prize, the Owen-Jones Studentship and the Grissell medal, together with "testimonies of study" from the final and intermediate examination. The Soane medallion was awarded with 100 guineas to Mr. W. A. Melton, for a design for a concert hall, and the Pugin Studentship, with 40*l.*, was won by Mr. J. H. Rutherford, who sent a collection of Gothic studies. Mr. Jas. B. Fulton secured the Tite prize by elaborate designs for a royal mausoleum, and Mr. Jas. Stewart the Owen-Jones Studentship and 100*l.* for a series of clever colour drawings. Among the other sketches were designs for a fruit and vegetable market and drawings of Chartres Cathedral, the mosaics at the Cappella Palatina, the north porch of St. Paul's Cathedral and Catharine College, Cambridge.

TESSERÆ.

Roman Architecture.

THE essence of good architecture of any kind is that its constructive system should be put boldly forward, that its decorative system should be such as in no way conceals or masks the construction, but makes the constructive features themselves ornamental. Both in Grecian and in Gothic architecture this rule is thoroughly and consistently carried out. In a Grecian building the entablature is the main feature of the construction, and it proclaims itself as such. In a Gothic building the pointed arch is the main feature of the construction, and it proclaims itself as such. In neither case is there any attempt at concealment or disguise of any kind. But how stands the case with Classical Roman architecture? Here we have a style in which the main feature of the construction is not made the main feature of the decoration. Here we have a style in which the great constructive features seem, as it were, ashamed of themselves, where they try to hide themselves behind a mask borrowed from a different system of construction. The architecture of classical Rome is, like the literature of classical Rome, imitative. Italy, the land to which the world practically owes the great discovery of the arched construction, may very likely have had a native architecture, as well as a native literature, in the days of the kings and the early consuls. But the architecture of classical Rome was a mere imitation of that of Greece. It was indeed but an imperfect imitation. The Roman architects were not so besotted as to cast away their own great invention of the arch, and to fall back on the less flexible, less diversified, constructive system of the Greek entablature. But just as they spread a varnish of Greek forms, Greek metres and what not, over their native Italian literature, so in like sort they spread a varnish of Greek decoration over their native Italian construction.

The Baldachin.

Bingham in his "Christian Antiquities" tells us about the early history of the baldachin. "In some of the more stately churches," he says, "as that of Santa Sophia, the altar was overshadowed with a sort of canopy, which from the fashion of it is termed by Paulus Silentiarius the turret, by others umbraculum, but among the Greeks most commonly ciborium, which Durandus and other modern ritualists usually mistake for the Pyxis where the Host is kept; but Du Fresne shows it to have been anciently quite another thing, viz. an ornamental canopy hanging over the altar. This was raised in the form of a little turret upon four pillars at each corner of the altar. The heads of the pillars were adorned with silver bowls, which was an usual ornament in those days, as is evident from the description which Eusebius gives of the twelve pillars in Constantine's church at Jerusalem. The top of it was in the form of a sphere adorned with graven flowers, whence it has sometimes the name of Sphera, Lilia and Malum. Above the sphere stood the cross as Paulus Silentiarius represents it. . . . I have been the more particular in describing this ornamental structure about the altar, after Du Fresne, because the common ritualists so generally apply the name ciborium only to mean pyx, whereas in the most ancient writers it signifies this beautiful fabric about the altar." There is an example of very ancient design in the church of San Clemente at Rome. Wren's (unfinished) model of the one he designed for St. Paul's is a lofty ornamental canopy, supported on couples of twisted columns at the north-west and south-west corners and by simpler supports at the eastern corners. In many of the Classical churches by Wren and other architects there were altar-pieces against the east wall of the chancel, which had detached columns, twisted or fluted, and were intended to give something of the same effect as a baldachin would give. In Mediæval illuminated manuscripts the canopy over the altar is often represented as a conical canopy suspended from above. But the ancient type of architectural canopy carried on four pillars is also found, though rarely. There is a beautiful Early Gothic example in the church of Our Lady at Halberstadt. What was it for? It had no use and no meaning beyond this, that it was a canopy of honour over the altar, and was used in the earliest churches which were built. The architectural argument in favour of these canopies is rather a strong one. The altar is the culminating point of the building, but it is a small object and it is difficult to give it prominence. The use of reredoses is partly to give artistic value and importance to this culminating point.

Masonic Craftsmen.

The wonderful fiction of wandering masons may be brought down from its high antiquity, and in all probability originated in the Middle Ages. We believe bodies of artificers were usually attached to Roman legions, who of course were wandering masons. After the downfall of the Roman empire, and when stone churches began to be built, artificers as well as priests came from Rome to instruct the people to raise durable places of worship. In consequence of the Italian expeditions of the German emperors of the Middle Ages some knowledge of the arts was imported into the countries beyond the Alps, and hence it grew into a custom for the German craftsmen after finishing their apprenticeship at home to spend a year in Italy to complete their education. Such, we suppose, was the origin of wandering masons.

Constable as a Landscape Painter.

It was probably the manner of Constable's execution, as much as anything else, which for a time interposed a serious obstacle to his success, particularly with artists or persons accustomed to attend to the executive detail of painting. "My pictures will never be popular," he said, "for they have no handling; but I do not see handling in nature." His aim, in fact, though we must admit it was not always successful, was to exhibit art, but not artifice—to efface all traces of the mere mode of execution—to conceal the handwriting of the painter and to imitate those mysterious processes by which nature produces her effects, where all is shadowy, glimmering, indefinable, yet pregnant with suggestion. In Turner more than any other modern artist—for in this respect we think he far excelled Constable—is this alchymy of art carried to perfection. Look closely at his pictures, and a few patches, dashes and streaks only are visible, which seem a mere chaos of colour, but retire to the proper distance, what magnificent visions grow into shape; how the long avenue lengthens out for miles; how the sun-clad city brightens on the mountain—the stream descends from the height—the distance spreads out into infinity; all these apparently unmeaning spots or accidents of colour, in which it is difficult to detect the work of the hand or pencil at all, being, in fact, mysterious but speaking hieroglyphics, based on profound combinations of colour and light and shadow, and full of the finest harmonies to all who can look at nature with the eye of imagination. Constable, as we have said, was not always successful in this, the most hazardous of all attempts in painting. If the touches of pure white, which he seemed to scatter on his trees as if from a half-dry brush, sometimes assisted the dewy effect which he loved to produce, they very often, from the absence of that power of just calculation which Turner seems so unerringly to possess, produced a spotty effect, as if the trees had been here and there powdered with snow. Very frequently he exchanged the pencil for the palette knife, in the use of which he was very dexterous, but which he occasionally carried to a blamable excess, loading his pictures with a relievo of colour, and provoking the remark that if he had not attained breadth he had at least secured thickness. On the whole, Constable, though now and then missing his object—sometimes, it would seem, as in his skies, from overlabouring his effect and trying too studiously to arrest and embody fleeting effects—was eminently successful in the result at which he aimed—that of conveying vividly and almost irresistibly the sentiment and delineative character of the scene. Everybody knows Fuseli's remark when standing before one of his showery pictures. "I feel the wind blowing on my face," was honest Jack Banister's remark while contemplating another of his breezy scenes, with the rolling clouds broken up by gleams of sunshine and the bending trees turning out their lighter lining to the gale. "Come here," was the remark of a French painter in the exhibition of the Louvre in 1824; "look at this picture by an Englishman—it is steeped in dew." "We never ask," said Mr. Purton, "whether his figures be well or ill placed; there they are, and unless they choose to move on there they must remain." This truth and artlessness and natural action or repose of his figures, only equalled in English landscape by those of Gainsborough and Collins, he probably owed in some measure to an observation of an early acquaintance—Antiquity Smith, as he was nicknamed by his brother artists, who at the commencement of his studies had given him this judicious advice:—"Do not set about inventing figures for a landscape taken from nature; for you cannot remain an hour on any spot, however solitary, without the appearance of some living thing, that will in all probability accord better with the scene and time of day than will any invention of your own."

NOTES AND COMMENTS.

The authorities of the University of Cambridge having obtained an assurance of financial aid are showing praiseworthy energy in arranging for the erection of buildings which are required if the University is to uphold its reputation as a school that represents the advances in science. Additional space for nearly all the museums is indispensable. The Museums and Lecture Rooms Syndicate, being of opinion that new botanical buildings are urgently needed, therefore recommend that immediate steps be taken to provide new buildings for the department of botany. The antiquarian committee also recommend that a syndicate be appointed, with power to consult an architect, to obtain plans and estimates for a new museum of general and local archæology and of ethnology, to be erected on the Downing College site. Other building projects are under consideration, and a very large sum could be expended with advantage. The financial board have recommended the introduction of the electric light into the Senate House, in accordance with the designs and specifications of Mr. T. G. Jackson, R.A., at an estimated cost of 400*l.*, exclusive of the architect's commission.

The reception of M. Guillaume, the sculptor, who is director of the French School of Rome at the Académie Française, gave an opportunity to M. Mézières to speak about the history and work of that school. France could claim the distinction, he said, of being the first country to recognise the advantage for young artists of a residence at Rome. Some critics suppose the training is merely to enclose their minds within narrow formulas. But there is no attempt during the three years to do violence to their instinct. The aim is, on the contrary, to provide the most solid and abundant intellectual nourishment, and by means of a variety of models to enable the student to discover what class of work is best adapted to his own powers. Then M. Mézières went on to speak of M. Guillaume as a sculptor. He believed that beneath the correct attitudes and the calm expression of M. Guillaume's figures there was a suggestion of ardent passion. There was a close relation between the sculptor's statutes and his own life, which was comparable to a work of art. Few contemporary artists have produced so much, and none has traced with a firmer hand the fundamental laws of æsthetics. The speech of M. Mézières was the reply which usage demands to the address of M. Guillaume on his predecessor the Duc d'Aumale. Owing to a temporary loss of voice the address had to be read by M. Brunetière, the editor of the *Revue du Deux Mondes*. M. Guillaume testified to the prince's complete knowledge of the history of art and his skill as an expositor of the great works at Chantilly with which he endowed France. As a man he followed an ideal, and realising that in our time a prince could not depend for position on birth alone, he endeavoured to prove that he was representative of advanced thoughts as became a French citizen in the nineteenth century, without forgetting his illustrious race. Although M. Guillaume was unable to take the principal part in the ceremony, all present sympathised with him. He can return to the Villa Médici with the confidence that his countrymen can appreciate his numerous disinterested efforts for the benefit of his country. A portrait of M. Guillaume appears in Boulanger's "Union of the Arts," which we have published, and he there forms one of a group of which the members are fast disappearing.

"One touch of nature makes the whole world kin," says Shakespeare, and the words could be applied to express the universal influence of the world's poet. After all the excitement which diplomatist emissaries of civilisation and others have caused, it is gratifying to find the French Chamber applauding Shakespeare with a fervour for which no precedents could be found recorded in "Hansard." In the debate on the Budget a week ago an ultra-Nationalist deputy objected to the performance of Shakespeare's plays in theatres which were partly supported by French taxpayers. The Minister of Fine Arts exclaimed, "Is not Shakespeare in his right place in the Comédie Française and the Odéon? and was not the city of Paris acting properly in erecting a statue of him as a homage to his genius?" Forgetting Fashoda, there were cries of "Très bien! très bien!" One enthusiastic deputy was so carried away as to demand that Shakespeare's dramas should be acted in their entirety and not adaptations of them. The Minister, in the continuation of his speech, said they must be logical, and if Shakespeare were excluded from the French stage, then it followed that the works of Titian, Raphael and Correggio, and other foreigners, should be evicted from their places in the Louvre. Reasoning of that kind was too convincing, and the Minister was allowed to have his way.

The term "Watling Street" is by itself sufficient evidence that the word street, like the Latin *strata*, signified a highway, a road. But in course of time the use of street was confined to ways in towns, and therefore there was a connection between it and the houses on one or both sides. Lord Selborne, in one of his judgments, said:—"In the natural and popular sense of the word 'street,' or the words 'new street,' I should certainly understand a roadway with buildings on each side (it is not necessary to say how far they must or may be continuous or discontinuous); and by 'new street' a place which before had not that character, but which by the construction of buildings on each side, or possibly on one side, has acquired it." A case has been decided (Allan & Others *v.* Vestry of the Parish of Fulham) in the Court of Appeal on the basis of that judgment. The plaintiffs received a demand from the vestry to pay sums of 554*l.*, 968*l.* and 248*l.*, the assessed proportion of the expenses of paving the Wandsworth Bridge Road. It so happened that the road or street was put into proper order by the Local Board of Works in 1876, a time when there were no buildings alongside the road. Houses commenced to be erected in 1890, and in 1897 the vestry decided that the road, having become a new street, should be paved. Subsequently a demand was made for the sums mentioned. The three frontagers considered that the road had been already prepared in the manner that was customary at the time. The magistrate decided that the street did not exist until houses were erected on it, and therefore the frontagers were liable. A divisional court took the same view of the responsibility for the paving. The Court of Appeal considered the previous judgments were right, because the road was not a new street in 1877, and did not become a new street until houses were built along it, and therefore the vestry were entitled to charge the paving expenses on the frontagers.

Although there appear to have been some rash statements in connection with the proposed Vauxhall Bridge and the County Council remain masters of the position, it is still the fact that the interference of architects has been advantageous. Some of the suggestions for the improvement of the design will be accepted. The weakest parts in an æsthetic sense are the supports for the lamps, but it is not difficult to make alterations which will entirely change the character of that part of the work. "They manage these things better in France" was the opinion of Sterne, and it would be a public advantage if architects could co-operate with engineers as easily as it is done in Paris. There, however, there are accepted principles of design, while it would be difficult to attain unanimity among the English architects who have signed the protest in regard to what should be realised at Vauxhall. But the principal obstacle to so desirable an arrangement is the belief that the ugly bridges over the Thames have paid better than those in which art was supposed to be respected.

SOME GOTHIC CATHEDRALS.*

(*Continued from page* 147.)

THE buildings in the Early English style to which attention had already been drawn belonged to the Lancet phase of now he would present them with an example of the same le just as it was about to pass into the Decorated—the rious Abbey church of Westminster, and, in the opinion of lecturer, superior in several points to Rheims, with which had features in common, both architecturally and his- ically. Henry III.'s portion of the Abbey consisted of the ir with its radiating chapels, and the transepts.

The first five bays of the nave, counting from the east, re added by Edward I. to contain the chorus cantorum; the nainder was not completed until the reign of Henry V.; but e same character with some differences of detail—noticeable efly in the omission of the rich diapering from the spandrels the six western nave arches—was preserved. Westminster bey was a French church in an English dress, the plan ing decidedly foreign, while the detail was throughout racterised by that grace and refinement inseparable from works of our architects, in illustration of which the triforium the north transept was shown.

Other views of the Abbey included that from the south the north transept, whose rose window was filled with ne of the most curious and historically interesting stained- ss in England. The work of Price, who flourished at the ginning of the eighteenth century, it was unrivalled as a cimen of his use of the pot metal. Another fine example of ice's work was the east window of St. Andrew's, Holborn.

The chapter-house of Westminster, after remaining for a g period in a state of terrible degradation and disfigure- nt, had been restored to its primitive splendour between 57 and 1871 under Sir Gilbert Scott, and the stained-glass ich filled its windows was among the finest produced since Revival—a liberal use of white enabling the colours to flash th with jewel-like brilliancy.

Remarking upon the octagonal form of the chapter-house at estminster, the lecturer was unable to offer any solution to question as to why the old Benedictine rectangular arrange- nt was departed from in this instance, beyond the sup- sition that privileges for building it in this form were corded to Westminster as a royal monastery, the chapter of ich would rank with those under episcopal jurisdiction. oughly speaking, the chapter-houses attached to cathedrals the old foundation, as York, Lincoln, Wells, Lichfield and isbury, were octagonal; while in such churches as were both riventual and cathedral, as Canterbury and Durham, and in se which, originally abbeys, were converted by Henry VIII. to cathedrals, as Bristol, Chester, Gloucester and Oxford, the engated or rectangular form was the rule. The subject of apter-houses was a highly interesting one, and required far re time than was at their disposal that evening.

Rheims Cathedral was shown next to Westminster, the turer remarking that the English abbey only required the stern towers of its French sister to render it one of the most autiful exteriors in Europe. The western façade of Rheims oked much attention, and Mr. Bumpus remarked it had been d that, to form a perfect cathedral, you must take the west nt of Rheims, the spires of Chartres, the nave of Amiens and the choir of Beauvais—he thought Le Mans.

In dealing with the various phases through which English hitecture had passed, it was difficult to assign any precise date the commencement of a particular style, each growing imper- otibly out of the preceding one. He had shown them a noble ecimen of the Transition from Early English to Decorated Westminster Abbey; now he would present them with one of the English style which had attained its highest excellence to- rds the end of the thirteenth century—the Angel choir of Lincoln Cathedral. This magnificent piece of work suffered rhaps from want of height, but the architect was fettered in s respect by the Early English choir and transepts he had to ld on to. The cost of this Angel choir at Lincoln was de- yed by offerings at the shrine of St. Hugh—a source of ome often in those days made available for great works, as had already mentioned when describing the work of North- ld at Ely for the reception of the shrine of St. Etheldreda, l the choir of Worcester for that of St. Wulfstan. England's ndest work in the Geometrical phase of the Decorated style s the cathedral of Exeter, rebuilt towards the end of the rteenth century by Bishop Quivil on the site of a Norman urch, of which the towers, now forming transepts, alone ained.

To the skill and munificence of this prelate and the good te of his successors in adhering to his plan we owe this, the st beautiful of England's cathedrals of the second class, whose glories were its unbroken line of vaulting, its window tracery, its choir-screen, upon which one of the noblest speci- mens of the king of instruments still stood, and its bishop's throne.

They would observe that in this cathedral the triforium had retired to the form of a mere arcade, probably from the wish of the architect to obtain a greater field in his clerestory for the display of stained-glass, which at that period was approaching such a state of excellence in this country. The same arrange- ment, viz. of the small triforium and the lofty clerestory, appeared in the nave at York, where, however, the two were combined. The nave of this cathedral was one of the largest and most important works undertaken during the Decorated period in England, but it could hardly be pronounced a success, the wide spacing of its pier arches enabling the visitor to see through the building in every direction. In this respect it was inferior to a contemporary and more modest work, the nave of Lichfield Cathedral, of which a view of the south side was shown. Here the arrangement of triforium and clerestory was reversed, prominence being given to the former, while the latter took the shape of spherical windows, but so beautifully arranged that their lines accorded perfectly with the severeys of the vaulting. Another lovely specimen of late thirteenth-century Decorated work was the chapel of Merton College, Oxford, a view of the interior with the seven lights of its east window taking the unusual form of a triangle, but enclosing the more familiar cinquefoil, was greatly admired. The chapel had been restored early in the fifties under the superintend- ence of Mr. Butterfield, and the colouring of the roof by the Mr. J. H. Pollen was alluded to as an interesting example of modern decorative work.

Another magnificent work of the Decorated period was the octagon of Ely Cathedral, so nobly conceived by Alan of Walsingham, to get rid of the narrow, tall openings insepar- able from the use of the tower in its normal shape. This old Norman tower at Ely had crushed in its fall (c. 1332) the first three bays of the choir, which had hereafter to be rebuilt, but in the Flowing phase of the fourteenth-century style (*i.e.* between 1345 and 1362). Mr. Bumpus directed attention in the view before his audience to the line of demarcation between this Flowing Decorated portion of the choir and that built nearly a century earlier by Bishop Hugh, of Northwold, not only by the total divergence of style, but by a rise of two steps and by the great shafts indicating where the old Norman apse began. He could not part from Ely Cathedral without remark- ing that its present magnificent appearance was due to those two eminent ecclesiologists, Deans Peacock and Harvey Goodwin, under the former of whom scholarly restorations were initiated under the superintendence of Sir Gilbert Scott, and which, begun during the later forties, were on this account in- vested with more than ordinary interest. Few cathedrals had had their choral arrangements more frequently shifted than Ely. Prior to 1768 the stalls for clergy and choir extended across the octagon into the nave. Between that year and 1771 they were removed under the superintendence of James Essex into the choir, and made to fill up the six Early English bays of Bishop Northwold's work, the first two Late Decorated bays forming a species of ante-choir, and the third being occupied by the screen supporting the organ. A water-colour drawing by R. H. Essex (d. 1855) in the South Kensington Museum, and one by Wild in his series of English Cathedrals, gave good ideas of the arrangements prevailing before Sir Gilbert Scott removed the stalls into the three fourteenth-century bays, did away with the cumbrous organ screen, erected the present light jubé, which admitted of the use of the glorious octagon for all the services, and arranged the reredos in a position that con- tributed a grandeur and dignity to this most beautiful of English choirs.

Imperceptibly the Geometrical phase of the Decorated style passed into the Flowing or Reticulated, and a fine example of this was shown in the great east window of Carlisle Cathedral. The carving of the pier caps was instanced as remarkably beautiful, and in the arches themselves the old Early English work was used up again, patent in the mouldings. The upper portions of this choir at Carlisle were, from lack of funds, poor and disappointing, compared with the arcades.

Exterior views of the grand east window of this cathedral and of that at the west end of York having been thrown on the sheet, the lecturer passed on to the choir of Wells, where the Late Decorated work of the last three bays, and of the triforium and clerestory above the first three arches, was mentioned as a particularly rich and beautiful example of the style just as it was about to pass into the Perpendicular.

Mr. Bumpus instanced the stained-glass in the east window of Wells Cathedral as a fine specimen of contemporary work. It represented the Tree of Jesse, and was thought very highly of by Henri Gerente, who was called away at the very moment when he seemed to have been raised up to carry out great things, and to take the place of a leader in the ecclesiological movement. This artist in stained-glass was on a visit to England during the forties for the purpose of studying our

* A lecture delivered on Thursday evening, March 2, by Mr. Francis Bumpus, before the Guild for Young Men and Women ached to New College, N.W.

ancient vitreous decoration. At the time of Gerente's visit a scaffolding happened to be fixed before this great east window at Wells. Procuring such paper as was to be got in the city he fell to work, and with his own hands succeeded, after a week's arduous labour, in making a tracing of the window. His labours were not thrown away, for when, after Gerente's untimely death in 1849, much of the work which he had projected was carried out by his brother Alfred, this window at Wells was reproduced in the western one of All Saints, Margaret Street. It did not prove satisfactory, however, and about five-and-twenty years ago was removed under the advice of Mr. Butterfield, to make way for the present magnificent one by Gibbs, but in which the same subject—the Radix Jesse—has been preserved, with superior figure-drawing and less offensive tinctures.

The number of English Decorated buildings, Early and Late, were of such extent that the lecturer could do no more than call the attention of his hearers to a few specimens, especially recommending to their notice the south side of the nave of Worcester Cathedral, the southern range of windows in the nave of Gloucester, the choir of Selby Abbey, the nave of Howden, the east end of Ripon Cathedral, whose window was a typal one of the Geometrical Decorated period, the central tower and north transept at Hereford, the choir of Bristol, the chapter-houses of Southwell, Wells and York cathedrals; the lady chapels of Chichester, Lichfield and Wells, and the tower and spire of Salisbury. But it was not among cathedrals that specimens of Decorated work must be looked for, but among the parish churches found in every corner of the land, and which, particularly in this and the succeeding style, were unrivalled by those on the Continent for grace and refinement. Mr. Bumpus recommended his hearers to study the churches of the Nene Valley from Northampton to Peterborough; while another magnificent line would be found to extend all the way from Sleaford in Lincolnshire to King's Lynn in Norfolk—including such gems as Ewerby, Heckington, Boston, Spalding, Holbeach, Gedney, Wisbech, Leverington, the Walpoles and the Wiggenhalls.

In showing a view of the interior of St. Ouen at Rouen, Mr. Bumpus remarked on the paucity of great Northern French churches in the Geometrical Decorated style, the greater portion of them having been built either too early—*i.e.* between 1190 and 1240, before the style had reached maturity—as, for example, Amiens, Bourges, Chartres, Coutances, Rouen, Rheims, Soissons, and the choirs of Auxerre and Troyes, or a little too late, just as Gothic was at the turning-point of its career, as exemplified in the naves of Auxerre and Tours. The gap left was but imperfectly filled up by the nave of Troyes, the church of St. Urbain in the same city—"the most magnificent spectacle that the genius of man has bequeathed to successive ages"—by Notre-Dame de l'Epine, near Châlons-sur-Marne, and by St. Benigne at Dijon. We were constrained therefore to look for examples of the French Middle Pointed style, as practised at the end of the thirteenth and beginning of the fourteenth centuries, in such portions of buildings as the lower part of the nave, with its aisles, at Troyes, in the chapels fringing the nave at Coutances, and in those occupying the same situation at Rouen.

The square east end was popularly supposed to be a distinctly English feature, but it might be found in various districts of France, though the causes which led to its adoption must be left in a great measure to conjecture. The view of the interior of the cathedral at Dol, in Brittany, was a good exemplification. Another and very similar instance was St. Julian at Tours, while in the Orleannais, especially in the vicinity of Etampes, the rectangular eastern termination formed the rule rather than the exception.* Nor was the use of the square end confined to France and England; it was met with in Germany, especially in Westphalia, the vast churches of Osnabrück, Paderborn and Herford being among the number thus terminated, and the lecturer remembered meeting with others similarly planned in Thuringian Saxony.

Several of the great Belgian churches which were rising during the thirteenth and fourteenth centuries were next shown and commented upon—Bruges, Ghent, Malines and Antwerp. Although very spacious and imposing in their ensembles, the religious edifices of the Low Countries fell very far below those of France and England in an artistic point of view, probably from the fact that their erection had not been entrusted to an educated body like the clergy.

Too many of them had been disfigured by successive coats of paint and whitewash, thus imparting an air of coldness and monotony to several of the most imposing interiors, but the lecturer was glad to say that of late years efforts had been made to get rid of these horrors, and churches like St. Martin, St. Paul and St. Croix at Liège, and the cathedral and church of St. Jacques at Ghent, now stood forth in all the splendour of natural polychromy, the red brick of their vaults and the blue and yellow of their columns, shafts and vaulting ribs presenting a striking assemblage of colours. But if they went to Mons they would see, in the great church of St. Waudru there, one whose interior had never been touched by the painter or whitewash dabber, and thus its interior as a virgin specimen of natural polychromy was of the highest value and interest.

Mr. Bumpus then said he would revert with them for a brief space to Germany and see what had been doing there during the thirteenth, fourteenth and fifteenth centuries. They would remember that at an earlier stage of the lecture he had dwelt upon the sudden transition on the part of the people of that country from their curious intermingling of the Round-arched and Pointed styles as exemplified in Neuss, St. Cunibert's Cologne, Bonn, Limburg and others to the complete Gothic. The church of Our Lady at Trèves was one of the earliest indications of this, and next came the vast cathedral of Cologne whose foundations were laid in 1248, and whose choir with its double aisles and radiating chapels, copied no doubt from Amiens, or Beauvais, or Rheims, stood completed in 1322. The transepts and nave were then proceeded with, but enthusiasm had died away, and all hope of completing the cathedral being abandoned early in the sixteenth century, those portions were hastily roofed over at the springing of their arches, and so left, with the colossal choir towering above them, until 1842 when, exactly 600 years from the commencement of the cathedral, the work of building it was resumed, and with such much ardour that in October 1863 the nave was completed and thrown open to the choir. Tom Hood, of whom it was said by a kindred spirit "that his various pen touched alike the springs of laughter and the sources of tears," visiting Cologne when the hopes of completing its cathedral were at zero, describes it in one of his letters as "a broken promise to God," and Wordsworth apostrophised it in the sublime sonnet commencing—

> O for the help of angels to complete this temple,
> Angels governed by a plan
> Thus far pursued (how gloriously!) by man.

Magnificent as it was, taken as a whole, Cologne Cathedral failed to interest in the same way as the old national church of the Rhenish provinces did. What the original Dom was like could not be ascertained beyond conjecture, but it most improbably resembled those of Worms and Speyer. He strongly urged the audience when visiting Cologne Cathedral to give their greatest attention to the magnificent old stained glass in the clerestory of the choir, which was too frequently overlooked by the ordinary run of visitors in their admiration of the glass which the well meant, but sadly mistaken liberality of royalty had endowed the south aisle and transept.

A more beautiful and truthful building, but one which might stand inside Cologne Cathedral, leaving plenty of room to spare, was that of Halberstadt, whose erection was spread over the whole of the complete Gothic period. A view of the nave was shown, bounded by its early sixteenth-century rood-screen, one of the finest in this land of screens, and of which another and more detailed view was given. Passing beneath it they would find the choir of Halberstadt Cathedral—now held by the Protestants—in much the same state as when, towards the end of the sixteenth century, prelacy was abolished in Saxony with its bishop's throne placed at the west end of the choir facing the altar; its stalls, tapestry, branch candlesticks and stained-glass.

The weakest part of this cathedral was the arrangement of its circumambient aisle, the awkward manner in which the lady chapel had been united to the north and south walls of the choir aisles being a blunder worthy of a German. The people of that country never seem to have had any affection for the procession-path with its chapels, preferring the tall and aisled apse as being more in accordance with their ideas of orientation, a point in which they were as strict as ourselves. The French arrangement, Mr. Bumpus remarked, might be seen with at Münster, Freiburg and Magdeburg, but, as in the case of Halberstadt, it was not nicely managed, and therefore far less satisfactory than the customary German arrangement of three or sometimes five parallel apses. In illustration of this the east end of the Dom at Erfurt was shown, the lecturer remarking that he had hardly ever met with such refined specimens of the complete Gothic of Germany as were displayed in the numerous and noble churches with which the capital of Thuringian Saxony is so liberally bestrewn.

With some detail from the western façade of Strasburg Cathedral, the series of German views came to a close.

In passing on to the Perpendicular style, of which they had seen the adumbration in the choir of Wells Cathedral, the lecturer remarked that of all the phases which Pointed architecture had passed through, this had the longest existence, was, moreover, peculiarly English, and retained its nerve long after the Flamboyant of France and Germany had passed into the Renaissance and Classical.

Its title, too, was singularly appropriate, but, as in the case of the other styles, it was difficult to assign the precise cause why

* It occurred too in Laon Cathedral and some neighbouring churches.

to its adoption. It may have been introduced for economical ons, the Flowing Decorated being very costly, or for the er display of stained-glass, which, during the fourteenth early part of the fifteenth centuries, had reached its per- ion. It was hardly necessary to point out the salient ures of this style, as they would be patent enough in the edrals and churches they were about to be shown. As an y specimen of the style the noble church of St. Mary at erley was presented, being followed by the naves of terbury and Winchester, both of which had their special its of beauty—the former having been built *de novo*, the r being Norman encased in Perpendicular. Another imen of this veiling of the styles was the eastern portion of ucester Cathedral, but although very noble and wonderful a whole would not bear minute inspection, much of the il being thin and poor. The choir of York Cathedral was d as another fine example of the Perpendicular in its ier stage, the lecturer remarking that its restoration and ting by Sir Robert Smirke after the fire in 1829 was arkably good, when we consider the early stage of the hic revival which witnessed it. Three noble Perpendicular ers, those of Magdalene College, Oxford, Gloucester edral and Canterbury Cathedral—each of a totally rent type—were then shown as glories of this epoch of lish Gothic. If Gloucester Cathedral tower, with its nacles set west country fashion on the top of the tower with- any connection with the other stages, was the king of pendicular towers, that of Canterbury was the queen, the urer only regretting that he could not show them such ncely West Anglian examples as those of St. Cuthbert, ls, Wrington, Bishop's Lydeard, Huish Episcopi and North herton. In illustration of a Perpendicular spire, the enth-century one of Norwich was given, surmounting the Norman tower, attention being directed to the lofty clere- y of Bishop Percy, which, with its chevet and flying resses, approached nearer to the continental type than thing we possessed.

Although the view before them was very good in this ect, Mr. Bumpus remarked that he was sorry the distance hich it had been taken precluded him from showing them old Norman processional aisle of the choir with its project- chapels, to which he had drawn attention at an initial stage he lecture.

St. Michael's, Coventry, another noble spire of the Third was next shown, followed by the interior of the chancel of tford-on-Avon—a remarkably charming specimen of the e. The magnificently restored reredos of All Souls College, ord, and the choir of Chester Cathedral, looking west, rded opportunity for some remarks upon the richness of the ner in which English churches were fitted up at this period, ancing the roofs, screens, stalls and bench ends of West and t Anglian Perpendicular.

(To be concluded.)

THE PROPOSED VAUXHALL BRIDGE.

A PROTEST against the erection of the new Vauxhall Bridge according to the design of Sir A. R. Binnie, the ineer of the County Council, has appeared in the *Times*. It is signed by the Archbishop of Canterbury; the Duke of stminster; Earl Wemyss; the Bishop of London; Sir ward J. Poynter, P.R.A.; Mr. Edwin A. Abbey, R.A.; Mr. orge Aitchison, R.A., president R.I.B.A.; Mr. Thos. Brock, A.; Mr. E. Onslow Ford, R.A.; Mr. T. G. Jackson, R.A.; W. B. Richmond, R.A.; Mr. R. Norman Shaw, R.A.; Mr. Alma-Tadema, R.A.; Mr. Hamo Thornycroft, R.A.; Mr. Waterhouse, R.A.; Mr. G. F. Watts, R.A.; Sir Arthur W. mfield, A.R.A.; Mr. G. F. Bodley, A.R.A.; Mr. Wyke liss, president B.A.; Mr. F. C. Penrose, ex-president R.B.A; Mr. G. H Fellowes Prynne, president Architectural ociation; Mr. W. Butterfield; Mr. Mervyn Macartney, ster Art Workers Guild; and Mr. John R. Clayton.

They say:—The leading London architectural societies (the Royal Institute of British Architects and the Architectural Association) have condemned the design in unqualified terms. The Institute coupled its protest with a request that the Chairman of the London County Council would receive a deputation on the subject from some of its leading members. This proposal has been declined, and all protests ignored. To all appearance the County Council is bent upon carrying out a design at once pretentious and costly, but lacking in those qualities which would make it in any way comparable to Waterloo or London Bridges, of which we are justly proud.

We desire to make our emphatic protest against the execution of this design in its present form, and to express our opinion that in this country, as in France, the design of an important bridge, where any attempt is made beyond utilitarian construction, ought to be placed in the hands of a competent artist, who should be responsible for its architectural detail as the engineer is for its structure.

For the want of this collaboration of the architect with the engineer, we have already seen the erection of three bridges of deplorable design—those at Blackfriars, Battersea and Hammersmith: we are now threatened with a fourth. The substitution of a good design, so far from increasing the cost of the bridge, would be rather likely to diminish it, since some of the features added for the purpose of adornment appear to us incongruous and unnecessary.

The London County Council has to seek Parliamentary powers for the erection of any bridge across the Thames.

If it refuses to listen to advice or suggestion on matters artistic, the ratepayers of London, or those among them who care about the architectural dignity and improvement of the capital, should look to Parliament for some future safeguard against any repetition of the expenditure of public money upon structures such as that now proposed, which, in despite of the costly nature of its architectural accessories, will, we fear, reflect no credit upon contemporary architecture, upon London, or upon the London County Council.

At the meeting of the London County Council on Tuesday last the subject was introduced.

Mr. Ward (chairman of the bridges committee) said he was glad to have an opportunity of going into this question. He felt that many of those gentlemen who had signed the letter in the *Times* would not have signed such a letter had they been cognisant of the facts. The bridges committee had received deputations from the art committee of the Royal Institute of British Architects on several occasions on the subject, and they had gone a long way to meet the various suggestions which had been received. As the result of a letter the art committee were received by the bridges committee on May 23, 1894, the President of the Royal Institute of British Architects introducing the deputation. On December 12, 1894, the standing art committee of the institution again saw the committee, and the engineer was instructed to furnish the standing art committee with sections of the bridge and give information as to the form of construction. On July 17, 1895, the bridges committee received the third deputation from the architects, who submitted a sketch design for the piers and abutments. This was referred to the engineer for consideration. Several letters passed, and the engineer was instructed to avail himself, as far as desirable, of the suggestions with which the bridges committee had been favoured. A model was subsequently prepared of the engineer's design, which included several modifications suggested by the art committee, and the engineer invited Mr. Waterhouse and Mr. Mountford to see the model. On February 19, 1898, Mr. Waterhouse wrote:—"Dear Sir Alexander Binnie,—The great courtesy shown Mr. Mountford and myself on Saturday last, in allowing us to see and have the advantage of your personal explanation of the drawings, model and details of your new Vauxhall Bridge, merits some expression on our part beyond mere verbal thanks. We congratulate you heartily on the general design and proposed construction of the bridge." They, however, went on to make some half-dozen further suggestions, and probably three or four of these would be adopted in carrying out the working drawings for the superstructure which were being made. It was manifest that the committee had gone a long way to meet the views of the architects, and in the end they felt that the engineer must be responsible for the design, as it would hardly do to put an irresponsible advisory committee in his place. It had been stated that a deputation asked to see the Chairman of the Council. The explanation of that was that the clerk opened the letter, and, seeing that it referred to bridges, at once sent it on to the bridges committee. The Chairman of the Council had stated that he had not seen that letter, but no doubt he would be willing to receive the deputation. The contract for the piers had been let, and the only thing that the committee could now alter was the superstructure. A sketch design had been sent in, but it was so unworkable in many respects that it could not be adopted.

NATIONAL PORTRAIT GALLERY.

THE trustees of the National Portrait Gallery have accepted as a gift a portrait of William Hone, the well-known satirist and author, painted by George Patten, A.R.A., and presented by Mr. Hone's daughter, Mrs. Joseph S. Soul. The trustees have also made the following purchases:—"Dr. Samuel Johnson," an unfinished sketch in oils, painted by James Barry, R.A.; this portrait, which was engraved in 1808 by Anker Smith, A.R.A., was for many years in the possession of the late Dr. George Tomlinson, Bishop of Gibraltar. "Charles, Second Earl Grey, K.G.," the "Reform" Prime Minister, painted by Sir Thomas Lawrence, P.R.A. "Col. Isaac Barré," the famous debater and orator in the days of William Pitt, painted by Gilbert Stuart; this portrait was given by Colonel Barré to his cousin, Colonel Phipps, from whose grandson it was obtained. "Robert Louis Stevenson," a pencil drawing, done at Sydney,

N.S.W., on March 17, 1893, by Percy Spence; purchased from the artist. "John Manners, Marquis of Granby," the famous military commander, drawn in black chalk, by Sir Joshua Reynolds, P.R.A., being apparently the original study for the various well-known portraits in oil. "David Garrick," a pencil drawing, done from the life by John Keyes Sherwin, the engraver. "James I.," a small portrait on panel, as James VI. of Scotland; formerly in the Brühl-Finkenstein collection in Germany. "James Clerk Maxwell, F.R.S.," the eminent scientific discoverer and professor; a painting on china.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last, Mr. G. H. Fellowes Prynne, president, in the chair.

The following were elected members of the Association:—Messrs. N. B. Fairweather, C. F. Houston, G. Gilbert Scott.

The Chairman referred to the resuscitation of the A.A. cycling club, which, he considered, possessed many advantages for members, especially as arrangements had been made for the co-operation of the camera club.

It was announced that the next spring visit would take place on Saturday, March 11, to the Great Central Hotel, Marylebone Road. Colonel Edis, the architect, would conduct the party over the building. Members were to meet at 2.30 P.M. At 3.30 P.M. a visit would be paid to the Great Central railway station adjoining the hotel.

Mr. A. Saxon Snell read the following paper on

Public Baths.

It is not my intention to go over the ground so ably traversed by Mr. Hessel Tiltman in this room a month since, if only because my paper might appear in some measure a mere résumé of his, and would lack interest to you. He described the broad lines and the general disposition of public baths and washhouses. I have proposed to deal with the subject much more modestly and rather with constructive details. But one cannot approach the constructive details without some preliminary survey of the planning of these institutions, and if the remarks I have to make under this head are somewhat more lengthy than a preliminary survey might appear to warrant, you must ascribe it to the weakness of an enthusiast who cannot help airing his pet theories, and I have many with respect to the planning of public buildings.

It is difficult to lay down hard-and-fast rules for the planning of any class of building in London, if only because of the restricted area and often extraordinary configuration of the sites which are chosen by enlightened public bodies, it would almost appear, with the idea of setting prize puzzles to aspiring architects.

In most other countries the best sites are always reserved for public buildings; in London for enterprising speculators. Generally in continental towns nearly every public building of any importance is bounded by streets on at least two sides. If the architect gets one fairly good frontage in London he is lucky.

But our very difficulties in this way stimulate inventiveness, and nowhere in the world can more ingenuity in planning be found, nor have greater triumphs been achieved in making the most of limited opportunities than in this huge conglomeration called London.

Given, however, a fair site, the least we can do in making our plan is to study carefully the uses of our buildings and the essential requirements of their administration, and then to concentrate all our attention upon so arranging the various parts of the building as to fit these requirements, and to render future administration as easy and economical as possible. It follows without saying that if we are architects in the most practical sense of the word, we shall be able to construct our buildings strongly and clothe them in the most seemly array, and make even our difficulties yield opportunities for effective design.

The word "economy" has been brought into contempt so often by its misuse in the mouths of those narrow-minded people with whom it is synonymous with "cheapness," that it is worth while to define our own meaning, the short form for which is arrived at by labelling it with the words "wise" or "true."

In planning a building, then, to insure or make possible "wise" or "true economy" in its administration, we mean arranging the various parts in such order as will enable those who administer it thereafter to do so with the least waste of human energy, and happy is the architect whose client perceives the true bearing of this principle and follows it to its logical outcome. It is only just to our clients, by the way, to say that it is largely recognised by them to-day, as can be shown by the lavish expenditure upon glazed bricks, majolica and other surface decorations, the great first cost of which is so soon repaid by their permanence, and the small cost of maintenance. We, as architects, are much more interested in the first cost of a building than in its subsequent maintenance, and it is therefore also our interest to build well from the first. That is by the way; it does not benefit us alone. Indeed, our share is, comparatively speaking, small; the benefit to the client far greater. For it is obvious that if by our skilful planning we make it possible to administer a building with five servants, say, instead of six, we save our clients a subsequent expense—to take a low estimate—of 50*l.* annually, a sum which capitalised could be expressed in buildings to the value of 1,500*l.* or thereabouts. Inversely, if by expending an additional 500*l.* our client saves the cost of one servant, he is the gainer by 1,000*l.*, and we, the architects, by 25*l.* It ought to be the other way round, but let that pass.

Those who, like myself, have had the privilege of going over the new baths at Shoreditch will agree with me that we are improving in our ideas as to what a public building should be. For some years our rulers have been slowly learning the lesson which we architects have endeavoured to teach them for many years; but they listened not to our voice, and even hinted that we advocated magnificence in our public buildings mainly because of the increased benefit to ourselves. But they begin to see now that money spent in buildings is not spent in the sense that it leaves us poorer, but rather that it is invested. They begin to realise that in no way can money be more widely circulated or give a better return to the community than in building. They realise that nothing is more educational to the lower stratum of human life than to house it decently and to accustom it to better surroundings. That money spent in public buildings must be regarded as invested only—and well invested—we have but to point to our old cathedrals, buildings which are now priceless, and who shall estimate their educational effect, even at the present day?

A little sign that the public are beginning to perceive these things is afforded by the growing tendency in competitions not to hamper the competitors by a fixed price. May the tendency grow into custom. Another is the custom of visiting other institutions to learn what is their best, and then to go on better.

Gentlemen, we of the younger generation of architects have a good time before us, and it behoves us to rise to the occasion and endeavour to inaugurate a new renaissance in architecture not only in purely architectural features, in new methods of construction, in the use of new materials and a better knowledge of the old ones, but particularly in our ideals of space and order. So we may foster the growing imagination of our clients and lead them on to yet higher ideals, yet nobler efforts. In that day the architect may be honoured in the land, and always get his name mentioned (and spelt correctly) in the daily papers when they describe a building.

I need not dwell upon the necessity of directness and simplicity of planning in public buildings. I remember many years ago hearing Mr. Aston Webb say, in effect, that one of the charms of domestic planning was what he described as "mystery," and when we call to mind the rambling arrangement of some delightful old houses known to us all, we must agree with him.

The very reverse obtains in the case of public buildings. The simpler and more direct our plans and the greater the proportion between the rooms and passages the better.

These and many other rules are common to all buildings for public use, and it is my purpose now to apply them, especially to baths. To do so more effectively, I have thought it well to try and realise what one would do with a fairly unrestricted site for a moderate-sized establishment; and the plan on the board is, perhaps, not perfect, but it will suffice for my purpose. I do not suggest for one moment that it is superior to any of the other designs which you see around the walls, but the difficulty of deducing rules of planning from the latter arises from the fact that in nearly every case the sites are not ideal, and therefore the plans represent only the best arrangement under the particular circumstances.

It will, perhaps, be more to the point if you regard the design in the light of a diagram such as are sometimes given out with the conditions of competition to indicate the lines upon which the client desires to have the building arranged.

I may be permitted to anticipate a criticism which will, I should, occur to some of you, and it is this:—Mr. Tiltman foreshadowed a different classification and distribution of baths in the near future, and his remarks upon this point were by no means the least interesting and suggestive part of his paper. You may be disposed to ask why I have not planned my building upon future rather than present-day ideals, especially as I have proclaimed my sympathy with the former. I can only say that until these new ideals have been well ventilated, it is impossible to say in what form they will be best adapted to the peculiar conditions of our own country. Moreover, the principles I shall draw from the diagram will, I believe, be applicable as much to future as to present-day planning.

Let me take you through the building, pointing out by the

ay the *raison d'être* of the various parts. It comprises three vimming-baths, respectively for first and second-class men id women, and eighty private baths allotted to the two classes id sexes in the proportion laid down in the Public Baths and ashhouse Acts. We will commence with the entrance iting-hall, which should always be the key to a plan. It is out 30 feet by 20 feet, and undivided, entered from the public reet by a short and wide vestibule, and dominated by the pay-fice in the rear. The first point some of you will notice is at I have only one entrance, which you will say is unorthodox. it is; it is usual to have at least two entrances, one for men id another for women. In many baths there are as many as ur, respectively for first and second men and first and cond women. I hope the time is coming—and that soon—ien we shall recognise that if it is not necessary to have parate booking-offices and entrances for men and women in raries, railway stations and other public buildings, it should t be necessary for public baths. When this is recognised we all do away with one of the most hampering restrictions ere is in planning these buildings. The hours I have myself ent in endeavouring to design a pay-office which should serve ur separate entrances, and yet be decently lighted and ntilated, I feel sad to think of.

Of course, when there is a public washhouse attached to e baths, two entrances at least are absolutely necessary. In ch a case I should, if possible, make the second entrance rve also for the second-class women's baths. I believe that lies find it less objectionable to meet a rough class of men an the same order of women; a working man is much more ely to bear himself chivalrously before a lady than one of her n sex in the same class.

Another point to which I draw your attention is the small-ss of the hall and corridor area compared to the size of the ilding, which is due in some degree to the one entrance plan. actically the same result has been obtained at the Plaistow ths, although the entrances are separated. Whatever may said in favour of a large entrance hall (and I myself would ve it of ample size) little can be urged in favour of corridors, pecially long and tortuous corridors. They take up room, st much to build, and more to maintain, clean and overlook, d to my mind show weak planning.

On one side of the vestibule is the superintendent's private ice, and on the other a staircase to his apartments above. cept in quite small baths it is a mistake not to provide a parate office, in addition to the pay office.

The pay office itself should be about 100 to 150 square feet t larger), and fitted all round with shelving for towels and thing drawers, &c. In an establishment of this size two pay ndows are necessary. It is desirable for many reasons (not least being that of commanding the entrances, &c., from all rts) that the front and sides should be glazed in the upper nels with obscured glass to the height of 4 feet from the ound, and above with clear glass.

Before leaving this part I may remind you that if you can ord any luxuries in the way of expensive fittings, joinery, vings, &c., your clients will raise less objection to their use the entrance hall than elsewhere. Public boards are very man—at least in their weaknesses. The superintendent's ice should also always be close to the entrance, as many ople come to see him who should not be allowed to pass into e building generally; 150 square feet is quite large enough.

On either side of the pay office are lobbies and short rridors—the shorter the better—leading to the swimming and arm baths.

You will see that the first-class men's swimming-bath is aced centrally, with those for second-class men and for men on either side, the warm baths naturally being on the rresponding sides. The provisions of the Baths and Wash-use Acts as to the proportion of numbers between the sses make it very difficult to preserve symmetry in planning.

Now my reason for placing the first-class bath centrally is at in all probability it would be convenient to alternate its e for first-class men and first-class women; and this may en be conveniently done, because ladies, I think, prefer to the, if at all, in the morning, whilst the men's baths are ways filled up in the evening. It is also in a convenient sition for use as a winter gymnasium, alternately for men and men.

The shorter length of the second men and women's imming-baths leave room for the boiler-house and engine-om, and the establishment or towel laundry, &c. These are t infrequently placed together, but it is not a necessary rangement, and is, indeed, undesirable if women are to be ployed in the laundry. The subway under the end of the st-class bath affords access from the engine-room to the iler-house.

If the site permits, these departments may be advan-geously placed in the basement, but if so, we should never ake the mistake of depriving them of light and air.

A system of subways is almost essential in public baths, and possible all main pipes for drainage and hot and cold water-supply and heating should be fixed along their walls or ceiling, where they can be repaired or renewed without disturbance or injury to the rooms above.

I may say that both at Marylebone and Plaistow, and also Stratford, I have subways under every part of the building. The superintendent's apartments will, of course, be placed on an upper floor over the front centre of the building; and one of the most important points to observe is to arrange the approaches so that the damp, warm air, which inevitably hangs about even the best ventilated baths, cannot find its way into the rooms. There are not a few superintendents who can speak feelingly upon this point. A small area or a way out on to a flat is very desirable. It is usual to provide about six rooms, and they should not be too small. It is not the most enviable existence to live and work all day in the atmosphere of public baths.

Now I propose to take the various parts of the building in detail, but before commencing I would draw your attention to certain features in some of the plans round the room, many of which have been most kindly lent me for the evening by their authors.

I call your attention, however, first to one which was not lent me by the author. I had it enlarged from a small plan in one of the building papers, where it was ostentatiously labelled as having been designed by a superintendent engineer. The name of the architect "for the erection" was also given, and I am inclined to think that it was the latter who published the plan with a suspicion of sardonic humour. The least I can say of it is that it contains a number of things which are not to be commended. I, who am indebted for so many suggestions and so much information as to the working of baths to one of the most enterprising and thoroughgoing superintendents in London, am scarcely likely to belittle the value of their opinions and experience, but I do not think that any capable superintendent with a sense of humour doubts the wisdom of each one of us "sticking to his last."

Note the plan of a bath designed by Messrs. Harrington & Lee now in course of erection at Romford. It appears to me to be a model in its way of good arrangement for a very small set of baths. We have another small example in the bath erected at Alloa, near Glasgow, from the designs of Messrs. Burnett, Son & Campbell. I cannot quarrel with the want of directness in the passages to the warm baths, for instance, because the very breaking away from the simple austerity of planning is made use of for some charming architectural effects. A small set of Turkish baths, with a separate entrance and a billiard-room, is provided.

I have ventured to show also the plans of the St. Marylebone Public Baths and two sets for the borough of West Ham, each of which may not be without interest as examples of the application of these theories applied to three very different sites. I think I may add that any of you who may be interested in seeing that at Marylebone will find a courteous guide, singularly well informed in all details of public baths, in Mr. Marchant, the superintendent; and I venture to say that there are a few points of interest, a few items of peculiar construction, a few difficulties overcome, and a few examples of how small an amount of light and air can be safely relied upon.

The Swimming-Bath.

The general arrangement of a swimming-bath is too simple and too well-known to need much description. It is invariably a large hall, enclosing a bath, the essential point of which appears to be that it should be as big as circumstances will allow. This is surrounded on all sides by a pathway or platform, as it is called, and a number of dressing-boxes arranged along each wall.

With respect to the bath itself, I do not myself advocate a greater length than 100 feet, and a very good width for this length is from 30 feet to 35 feet. In deciding upon the dimensions of a bath we have to bear in mind that water costs in London about 6*d.* per 1,000 gallons (often much more and seldom less), and if a bath is emptied and filled only three times a week, the expense is heavy if the size is greater than need be. Of the three dimensions, I should place first in importance the length, and next the depth and width.

One of the most popular uses of a good bath is as a swimming racecourse, and as the unit of length in races is always the yard, and the divisions mostly multiples of 100, it is, I think, acknowledged by swimmers that 100 feet is a very convenient length for a racing bath. Three lengths go to the 100 yards; 25 and 30 yards are easily measured off.

Our water depth should vary from 3 feet 6 inches to 6 feet 6 inches or 7 feet; in second-class baths 3 feet to 6 feet, the latter being used far more by boys than grown men. Theoretically, the deepest part of the bath should be about 10 feet from one end, because that is where a high diver would, generally speaking, strike the water.

The level of the water should not be less than 12 inches below the footway curb, and this level is maintained by the overflow trough, which it is usual to place along the wall at the

deeper end. This overflow has been variously contrived with an iron projecting gutter, a series of holes, or a sunk gutter hidden by a flush brass or iron grating. The best form I have seen is that adopted at Shoreditch, which is a large moulded trough made in long lengths of majolica. For neatness of appearance, and also, I fancy, economy, Mr. Tiltman's white glazed sunk channel is nearly, if not quite, as good. A small modification would improve it.

(To be continued.)

VITREOUS ENAMELS.*

I DO not intend this evening to trouble you much about the technical part of the art of vitreous enamelling on metal, but rather to mention a few elementary points only in order that you may more clearly understand the one or two simple terms I shall use in describing the finished examples, slides of which I have to show you on the screen.

Enamelling is, of course, the outcome of the very ancient art of glass-making, and it is likely enough that the discovery that certain kinds of glass will, under particular conditions, adhere to metal, was accidental.

I define an enamel, for my present purpose, as a glass film fused upon, and adherent to, a metal ground work.

Glass, as we know it, is not one substance alone. (Silica 5, crystal borax 3½, and nitre 3½ makes glass easily with a blow-pipe.) The main ingredient in all glass is silica, or, as we popularly know it, flint, and with this are mixed various other substances, which render it easier to fuse, and softer when fused.

A Japanese recipe for an enamel glass is given by Mr. Bowes as follows :—

	Per cent.
Oxide of lead	37·15
Lime	4·92
Magnesia	0·90
Soda	5·19
Silica	51·84
	100·00

This is colourless, but for the purposes of enamel workers such glass would rarely be needed ; colour becomes a necessity, and it is easily produced by melting the proper kind of glass with the oxides of various metals. There are now many shades of enamel colours procurable, but in olden days they were few and simple, such as—

Red, probably due to oxide of lead with mercury (Watson), or might be oxide of iron (Bowes).

Blue, oxide of cobalt.

Green, oxide of copper.

Different proportions of iron will give grey, yellow and pink, and black may be iron or copper or manganese. The oxide of tin makes an opaque white, and the oxide of gold, on gold, a rich ruby red. When used with the oxide of tin any of these colours will make opaque enamels—without the tin they are generally translucent in different degrees. On impure metal translucent enamels are always likely to become opaque after the firing.

The most usual metals on which enamels are fused are gold, silver and copper. Translucent colours will sometimes fuse satisfactorily on all these, but they are only to be relied on when they are on a fine gold ground. The process, roughly speaking, is to grind the enamel to a fine powder in a mortar, and apply it wet to the metal where required ; then fuse all together at a red heat, either by blow-pipe or furnace.

The earliest enamels existing are now to be found on some of the pieces of exquisite gold jewellery made by the Greeks and by the Etruscans about the sixth century B.C. These enamels are small and accessory to the finest work in gold ever made. Little shallow spaces were outlined by means of a fine twisted gold wire soldered on to the metallic groundwork, and into these "cloisonné" spaces the enamels were fused, most likely by means of a blow-pipe.

The colours used are dull blue, dull pale green, and white Besides these little cloisonné pieces there are also found among the Etruscan jewellery several instances of earrings with small pendant figures of animals and birds in white enamel fused on a gold wire fashioned in a proper form ; after these there are no enamels to be found for a considerable time. Whether the art was lost or whether simply the examples of it have been lost I cannot say, but there seems to be no trace left of it until we come to the third century A.D., when a Greek writer, Philostratus, in a work called the "Icones," mentions variegated horse-trappings, and writes :—"They say that the barbarians who live in, or by, the sea (en okeano) pour colours on to heated brass, and they adhere, become as hard as stone, and preserve the designs which are made in them." This undoubtedly refers to vitreous enamels, and moreover i seems very likely that it also refers to Britain, as the dweller in an island might well be described as "living in the sea," bu some authorities think the Gauls are intended. Although we now have no instances of enamelled work done in Britain so early as the third century, there are many specimens of house furniture belonging to the late Celtic period which show clearly enough that such objects were in all probability commonly made. On these the colours are simple, dull red, dull blue and dull yellow being almost always found. Specimens have been found in Yorkshire, Somerset and Norfolk particularly.

In Ireland were made beautiful cups, shrines and bell covers, ornamented with enamels and niello work at a very early date, the Ardagh cup being perhaps one of the finest pieces left ; it is supposed to date from the ninth or tenth century.

The Romans brought the art of enamelling on bronze with them, and practised it largely here up to the fifth century—(Romans left Britain 436)—and after them what may be called the Anglo-Roman work, nearly resembling the actual Roman continued for some time, the colours being dull red, dull blue dull green and white rarely. These enamels are usually on small objects—fibulæ or brooches, pins of various kinds, studs and numerous small articles of little artistic merit. Some of them appear to have been made of brass (copper and zinc) and some of bronze (copper and tin, with sometimes phosphorus manganese, lead or zinc), and they appear in many cases to have been first cast from a mould, and subsequently finished with a graver, in the champlevé manner, in preparation for the enamel. The bronze pieces often have a beautiful green patina upon them.

From the fifth century until the coming of the Normans during the Anglo-Saxon period, much beautiful jewellery with cloisonné work was done here, probably by Celtic workmen At first sight much of this appears to be enamelled, but actually it resembles the Egyptian work of like character, the cloisonné spaces being filled with accurately-cut pieces of stone glass or composition, kept in place either by some strong cement underneath or else by the slight projection of the upper edge of the cloison itself. Generally, if the cloisons enclose deep hollows, this inlaid work may be expected ; but if the hollows are shallow, they are more likely to have been enamelled.

During the reign of King Alfred, in the ninth century (879-96), it is possible that a much finer kind of enamelled work than any that had preceded it in these islands was produced. There are now, I believe, only four specimens of this work left, and they are fine instances. One is at the Ashmolean Museum at Oxford, and is known as the "King Alfred's jewel ; round the setting is a legend saying, "Alfred caused me to be made ;" the other three are in the British Museum, one known as the Dowgate Hill brooch, because it was found there. It bears the crowned portrait of a king, supposed to represent Alfred himself. Another, known as the Hamilton brooch, because it belonged to Sir Wm. Hamilton's collection, has a charming conventional design in the centre, and the last bears a female bust, the enamel of which is discoloured by time. All these are most skilfully and beautifully worked in the finest cloisonné manner and many of the colours are translucent ; the three brooches in the British Museum are, moreover, set in gold, two of them with pearls. They are pieces of jewellery of which any nation may be proud, and, moreover, they are amongst the very earliest existing enamels in which any attempt at portraiture has been attempted. Even if the Alfred Jewel and the female bust brooch are not meant for any particular person, there seems to me little doubt that the Dowgate Hill brooch is intended to represent an actual king, as it is crowned with a similar crown to those which are shown on coins about the same time.

All the fine arts received a stimulus under King Alfred. There is a tradition that he sent Bishop Sigelin to India. The expedition brought back stores of treasure, precious stones and jewellery of various kinds, the study of which is supposed to have encouraged Alfred's goldsmiths, who are said to have worked under his personal supervision, a supposition to some extent supported by the words on the edge of the setting of the Alfred Jewel, "Aelfred me heht gewurkan."

I will first show you slides of two pieces of metalwork that have no enamel or inlays left in them, but which will make more clear than any words the meaning of the terms "cloisonné," "champlevé" and "bassetaille."

Byzantine.

The school of enamelling to which I shall now draw your attention is that known as the Byzantine, remembering always that this term must be considered to represent a style, rather than only such work as was actually done at Byzantium, a style moreover, which spread widely, and had great influence for a long time in the entire world of art.

Byzantium was an ancient city of Thrace, founded by a Greek colony under the leadership of Byzas, whence

* A paper by Mr. Cyril Davenport, read before the Applied Art Section of the Society of Arts, and published in the *Journal*.

ne, in the eleventh century B.C., but it did not arrive at any portance until about 330 A.D., when Constantine the Great de it his capital and called it after his name, when Constanple became the centre of the Byzantine or Eastern Empire. The Byzantine school of art developed from the Classical ing the fourth and fifth centuries A.D., and flourished until conquest of the empire by the Turks in 1453, and the more rly it approximates to its Greek original the finer it is.

The style spread largely, and its influence strongly survives, n to the present time, in Russia. It is always rich in colour, n to an exaggerated extent, and the Byzantine workmen said to have jealously guarded the secrets of vitreous melling in metal until the latter half of the eleventh century, r which the knowledge became widely spread, owing partly the migration of their own workmen and partly to the ming of foreign workmen, who took the knowledge back h them to their own countries.

The very early Byzantine enamels which still exist are ely figure subjects, and in all probability those which ceded them, if there were any such, were of the same racter. It is very likely owing to this that nothing now ains to which an earlier date than the tenth century can any probability be assigned. This is supposed to be ut the date of the small pectoral cross or reliquary which nerly belonged to the Beresford Hope collection, and is in the British Museum. It is very delicately cloisonné, bears representations of Christ, His Mother, and Saints.

An explanation of the disappearance of the very early antine enamels may be found in the existence of a curious or party founded in the Eastern Empire by the Emperor the Isaurian, and continued by his immediate successors, nstantine Copronymus, Leo the Armenian, and Theophilus. s sect was called the "Iconoclasts," and their mission to destroy all images of any kind wherever they could them. They lasted until the ninth century. It is very ly that in the churches were many enamels of saints and personages, and it is quite possible that the iconoclasts le practically a clean sweep of them.

There is fortunately one magnificent piece of enamel work existing, which makes it easy to realise that the iconoclasts have had full provocation for the destruction of such sures. This is known as the "Pala d'Oro," and is the back he altar at St. Mark's Cathedral at Venice. It is about eet long by 5 feet in height, and consists of a silver-gilt nework, richly worked and studded with jewels, set, moreor, with enamels of different dates and sizes, portraits, saints scenes from Biblical history.

The two largest enamels represent our Saviour and the hangel Michael, and parts of both of these are in relief and elled, the relief pieces being added after the enamels were shed. In the lower part are two most interesting figures, a portrait of the Doge Ordelafo Faliero, and the other the press Irene. There are also two panels of silver with raved inscriptions which seem to have been added about the teenth century. These inscriptions tell us that—(1) Under Doge Ordelafo Faliero in 1105 the Pala "Nova facta fuit," that under the Doge Pietro Ziani in 1209 it was "Renoa;" (2) that under the Doge Andrea Dandolo in 1345 it restored, "Novatur."

So from its own evidence we gather that it certainly was er than the date of the Doge Ordelafo Faliero, and it further ears from the ancient chronicles of Venice that in the tenth tury the Doge Pietro Orseolo (976-77) ordered a "tabula" e made for St. Mark's, which is supposed to be the Pala, Francesco Sansovino in his book on Venice says that it not actually brought there until the twelfth century.

No doubt the Doge Ordelafo Faliero altered the Pala conirably, and one of the ancient enamels of a Byzantine peror has been newly lettered with his name in Latin, and ther ways changed especially as to the crown.

There has been considerable difference of opinion among erts on the question which of the Byzantine emperors this re originally represented. Ludwig Pasini thinks it may e been John Comnenus, as the companion figure is that of mpress Irene, the name of his wife, who was a daughter ing Ladislas, King of Hungary. It is, however, equally ly that it represented the Emperor Alexis Comnenus I., se second wife was also named Irene. The enamel of the ress still has its original inscription in Greek, and has not en so much altered as the other. It is a figure full of dignity, I think, may be considered one of the finest Byzantine nels existing.

The peculiarities of the royal dress of the Byzantine erors are admirably shown in these two figures, and it is resting to note how they are almost in exact correspondence the figures of an ancient crown which was discovered in in a field at Nyitra-Tranka in Hungary. The plates of crown are seven in number and are of different sizes, ded at the top; the largest is enamelled with a portrait of Emperor Constantine X., called Monomachos, the two next st his wife, the Empress Zoë, and her sister Theodora, the remaining enamels being of two dancers, and allegorical figures of Humility and Truth. The date of it is about the middle of the eleventh century; the emperor died in 1054. These plates doubtless formed part of a crown designed after the Byzantine fashion, the best existing example of which is the crown of Charlemagne, now in the Royal Treasury at Vienna.

Subsequent researches resulted in the discovery of fragments of jewelled edges and miscellaneous pieces, by the aid of which the antiquary, Franz Bock, has made a restoration of the complete crown.

Besides these, I have to show you a few Byzantine enamels on bookbindings, and, as well as the crown of Charlemagne already mentioned, there are fine plaques of a similar shape on the very curious crown of Hungary, now at Buda-Pesth.

Limoges and France.

At Limoges, a town of Central France, there began in the twelfth century an output of enamelled work which lasted until the eighteenth century. There is documentary evidence of such work having been made at the earlier date, and, what is more to the purpose, a few actual pieces have survived, and during the thirteenth century particularly there was a very large production of ornaments of the altar, shrines, reliquaries, pyxes, crucifixes, candlesticks, tombs, horse trappings, sword pommels, belts and a host of other miscellaneous objects of use as well as ornament. This work was known as "Opus Lemoviticum," or "Opus de Limogia."

The enamels used were, as far as I have observed, always opaque, and they were applied to thick copper in the champlevé manner. Designs are frequently repeated, a sign that the commercial value of these enamels was at all events not lost sight of.

It is possible to make a rough classification of the earlier Limoges enamels, chiefly by means of the different manners of treating the backgrounds, and also by the manner of treating the figure-subjects.

1. In the twelfth century the backgrounds were in gilt metal, with delicate engraved designs, the figure-subjects in enamel.

2. In the thirteenth and fourteenth centuries the backgrounds were enamelled, generally in dark blue, and the figure-subjects were in gilt metal, either engraved or in partial or whole relief.

During the whole of this time some of the enamel colours were allowed to gradate into each other without the interposition of a metal boundary line. The colours which are treated in this way are usually in small bosses, corners or monumental scrolls; they are arranged in two sets—deep red, dark blue, pale blue and white, and dark blue, green and yellow. This merging is not, however, to be considered as an absolute sign of Limoges work, as it also occurs on German enamels of an early date, the blue gradating to white, and the greens to yellow.

Towards the end of the fourteenth century a lull came over the large production of enamels from Limoges, probably to some extent due to over-production, but also to the growing appreciation of works of art in ivory, the precious metals and other media; but during the latter half of the fifteenth century a remarkable reaction set in, not that the old champlevé manner of working recovered its lost ground, but a new, freer and more artistic method came into existence. This is known as the "painted" style, and in it the copper is left plain, the enamels being applied direct upon it. The painted enamels are in two distinct manners, one known as "grisaille," and the other in rich colours. In the case of the grisaille enamels the surface of the copper is all covered with a very dark enamel, and on this the design is "painted" in white, layer after layer, thick in the high light and thin in the shadows. On these enamels there is here and there a little red or flesh colour and a liberal use of fine gold painted lines and scrolls. One great value of the painted gold lines in enamel work is that, as it always looks the same before firing as it does after, the artist can accurately judge the effect he is producing. The painted enamels in colour are, so to speak, inlaid side by side, or, in some cases, where special parts are required to be particularly brilliant, shaped pieces of gold or silver foil are applied with translucent enamels over them, the rest of the enamel being finished first. On these coloured enamels there is also a free use of painted gold lines and scrolls, often used to mask the lines of junction of the different colours, which are likely to show accidental defects, and to some extent run into each other.

A convenient classification of the painted enamels into three styles was suggested by Sir Wollaston Franks, *i.e.*:—

1. The "Early Style," from 1475 to 1530.
2. The "Fine Style," from 1530 to 1580.
3. The "Minute Style," or the decadence, from 1580 to the close of the manufacture in the eighteenth century.

The peculiarities of these three styles may be briefly described as follows:—

1. The "Early Style" (1475-1530) was on thick copper, nearly flat, the whole surface being smoothly covered with a

very dark, nearly black, enamel; in this the design, as I have already mentioned, is painted in white enamel, with traces of colour and gold lines. Sometimes large pieces of foil under translucent enamels were used in such enamels as were also painted in colour, but these paillettes are never used with grisaille work alone.

2. In the "Fine Style" (1530-80) the copper is much thinner, and there is a marked Italian influence seen in many of the designs. Large pieces of foil under translucent colours were discontinued, but the use of very small pieces of jewel-like form and arrangement called "paillons" came into use. Astists of the family of Penicaud used these "paillons" freely; they also frequently stamped the letters "P. L." on the copper of their enamels, probably standing for "Penicaud Limousin." The paillons are not much more satisfactory than their predecessors the paillettes, as in both cases the translucent enamels have a special tendency to chip off, and otherwise fine enamels are often spoilt by bare patches caused by the disappearance of these accessory pieces, colour and foil as well.

To the Fine period belongs the greatest enameller whose name is known, "Leonard dit Limousin, Esmalieur peintre, valet de chambre du Roy." His earliest signed work is dated 1532 and his last 1574. His work took many forms, vases, cups, chessboards, dishes, &c., but the most important are the wonderful series of portraits, generally the bust only, of the most notable personages of his time in France, ranging from Francis I. and his Queen downwards. The frames of many of these portraits are also often ornamented with small enamelled plaques.

There are several other names of note among the Limoges enamellers of this time; among them may be mentioned Pierre Raymond, who usually painted in grisaille with slight colour and gold; Jean Courtois, who used "paillons," and produced an especially fine black for his background; and Pierre Courtois, whose figures are beaten out in relief before the enamelling is done. Jean Court, dit Le Vigier, worked largely in grisaille with slight flesh colour, and is known to have made caskets his especial study.

3 The "Minute Style," or as it may well be called, the decadence, began about the end of the sixteenth century. It is marked by finical execution, probably due to the discovery of a new medium which would carry the metallic colours—resembling what we now call "oil colours." Susanne Court worked faces in profile, finished freely with fine gold painted lines, and the Limousins (Jean, Léonard, Joseph and François) all made small works, the designs on which are freely taken from contemporary prints.

After 1620 the Limoges enamels lost ground rapidly, the best work of the period being produced by artists of the family of Landin; these enamels usually have brilliant black backgrounds, and in the eighteenth century the manufacture as an important industry came to an end.

Limoges was not the only place in France where enamelled work was made. From some workshop in Southern France comes the splendid gold cup, now in the British Museum, known as "St. Agnes Cup," as it bears the history of that saint upon its sides and lid, in bassetaille with translucent enamels. It is the finest existing specimen of this kind of work, and is supposed to have been made during the fourteenth century.

During the seventeenth and eighteenth centuries the minute style of painted enamels, used probably with an oil medium, developed largely in the direction of watch-cases, and exquisite work of this kind was done by several artists of note, in latter times much of it being made at Blois. I regret I have no slides of these to show you; the finest works of this kind I have yet found are by Toutin, Durant, Muisard, Camille André, Bouvier, Molière, Vauquer, Petitot, Bordier and Zinc, while for quite modern French work that of M. Fernand Thesmar is perhaps most to be noted, the skill shown in his work in plique-a-jour being quite wonderful.

Miscellaneous.

Besides the three large divisions into which I have divided my slides there are many other schools of enamelling to which I can only draw your attention by means of a few single examples.

In Italy and Germany the art is old, but in the rest of my miscellaneous slides you will only see comparatively modern work.

The best Japanese work was done during the last century, and is, I think, unequalled for minute working of cloisonné enamels; for delicacy of workmanship and intricate design they have never been equalled. The modern Japanese work is in all technical ways masterly to the last degree, but the design is usually weak.

English work in enamels has found a worthy champion in our member, Mr. Starkie Gardner, and, as he says, no doubt whatever a careful examination would reveal many treasures of home production which are now credited to foreign workmen. What we know is fine, but more is still to be known. The Garter plates at Windsor range from the fourteenth centu onwards, and in the same century and during the fifteenth the was a large production of enamelled croziers, usually silver gi cups, ornaments of tombs and sword pommels, some of the with translucent enamels. At Oxford and Cambridge, and many other places are preserved several splendid cup exquisitely wrought in silver as a rule, and with enam ornaments.

During the last century there were the manufactories Battersea and Liverpool, from both of which there was a lar output of small articles. These are on copper, covered all ov with a groundwork, usually white, on which designs are paint in "oil colours," and sometimes printed. The best of these a probably the candlesticks, some of which are graceful enoug The enamels vary considerably in artistic value, but general they are not particularly good.

There is to-day a revival in England of interest in t beautiful art of enamelling. We have been fortunate of la years in having had the opportunity at the Royal Academy, t South Kensington Museum, and elsewhere of examining ar appreciating the fine work done in this medium by artists suc as Messrs. Geo. Frampton, Hubert Herkomer, Alex. Fish and Nelson Dawson, and also a helping hand of great valu has been given by the excellent technical school of arts ar crafts under the auspices of the London County Council.

It is only of comparatively late years that fine enamels ha been made in India, among other places, at Lucknow ar Jeypore, the last being remarkable for the fine ruby red (oxi of gold) in a gold groundwork.

At Partabgarh a peculiar kind of enamel is made; desig cut out of thin gold are inlaid in a dark green groundwork.

At Damascus and other places in the East an easy and ve effective way of producing enamels, apparently laborious made by means of champlevé work, has been hit upon. T outline of the design is simply repoussé from the back of t copper, and the hollows thus made on the other side are rougl filled with opaque enamels.

In Russia a considerable quantity of enamel work is do on silver and copper. It is usually cloisonné, but sometim painted on a thin enamel groundwork, always in opaq colours; most of it is not earlier than the last century. T cloisons are variously produced by soldering, casting repoussé work.

Charming work in plique-a-jour is done at the present ti by I. Tostrup, of Christiania, and by M. Hammer, of Berg often in bowls and spoon-handles.

During the last century many small enamels, snuff-box candlesticks, &c., were made at Dresden.

The paper was illustrated by a series of lantern slides of t different classes of enamels, coloured by Mr. Davenport.

GENERAL.

Mr. Onslow Ford, R.A., on Monday submitted for Queen's inspection a model of the statue to commemorate H Majesty's Diamond Jubilee, which is to be placed in front the Municipal Buildings at Manchester, and also a mar bust of the Queen which he has executed for Her Majesty.

The Bishop of Bristol has received permission from Queen to state that Her Majesty takes an interest in the resto tion of Malmesbury Abbey.

M. Luc Olivier Merson has read a paper before the Fre Institut on the late Emile Signol, the painter, his venera predecessor in the Academie des Beaux-Arts.

Mr. Robert Neill, who was mayor of Manchester for years in 1866-67 and 1867-68, and high sheriff of Rutlan 1889, died at his residence in Higher Broughton on Sun last in his eighty-third year. In 1842 he founded the g building business of Robert Neill & Sons. Mr. Neill wa native of Moffat, Dumfriesshire.

St Jude's, Bethnal Green, which the vicar consider be "the purest specimen of Byzantine architecture in Lond is in danger of falling into complete decay. 1,200*l.* has b spent on reparations in the last two years, and a sum of 8 is still needed. The churchyard wall, which has long b leaning, collapsed on Sunday last.

The Next Visits of the Edinburgh Architectural Associa take place to-morrow, the 11th inst., and will be to Coli Castle and House and Redhall.

The New Central Criminal Court will be very n larger in size than the existing building. It is announced it will extend to Newgate Street, for the site of Newgate been purchased for 40,000*l.*

Adam de Brome's Chapel, belonging to Oriel Coll Oxford, is to be transferred to the University on payment the college of 270*l.*, the estimated cost of repairs immedia necessary, the college retaining right of access to Adam Brome's tomb for repairs, &c.

THE

Architect and Contract Reporter

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, Imperial Buildings, Ludgate Circus, London, E.C.

For Advertisement Scale, see page xiii.

COMPETITION OPEN.

AT the Edinburgh Architectural Society on the 1st inst. Mr. A. Balfour Paul read a paper on the "Staircase." Mr. A. Lorne Campbell was in the chair. The paper was devoted chiefly to a review of the general principles of stair design, and the lecturer incidentally deplored the modern conditions, which so frequently cramped the space and curtailed the light, to the danger of those using the stair. A free discussion on various points raised ensued.

Soho Cowl & Ventilator

(NICKLIN & MILWARD'S PATENT).

This COWL has been used as a Ventilator, both on Workshops and Offices, with most satisfactory results, and has proved a conspicuous success as a House Cowl, possessing as it does great suctional power, perfectly noiseless action, and great durability, being made of steel.

The COWL has proved a perfect cure in the case of most troublesome chimneys.

TESTIMONIALS.

"I consider your cowl far above any other cowl in the market, and have much pleasure in recommending it to anyone suffering from smoky chimneys."

"Forward the 10-inch cowls on order at once; we have fixed the others and find they give every satisfaction."

"Your cowl has proved a complete success, no matter which way the wind blows. Please forward me another one at once"

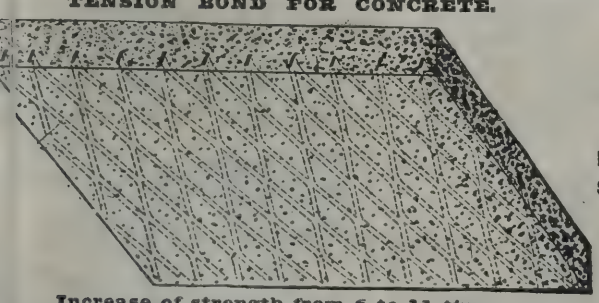
A MOTION has been made in the Aberdeen Town Council by Mr. Fraser to the effect that a committee should be appointed to consider and report as to the advisableness of procuring or erecting premises suitable for the city concerts and lectures, and which would also be available for other public functions. He said there was undoubtedly a strong and growing feeling in the community that more commodious, comfortable and better-equipped concert and lecture-hall accommodation should be provided. He did not think he was over-stating the case when he said there was no such place in Aberdeen as a comfortable or well-equipped concert-hall. Mr. Kendall Burnett seconded. Bailie Lyon moved the previous question. He did not think the present was an opportune time to raise a discussion as to the Corporation going in for a city hall. It was well known that the directors of the Music Hall had begun to overhaul the whole of the premises. Mr. Wilkie seconded, and, after discussion, the amendment was carried by fourteen votes to thirteen.

THE PROBLEM SOLVED.

ORDINARY WOOD RENDERED FIRE-RESISTING THROUGHOUT WITHOUT AFFECTING ITS UTILITY AS A BUILDING MATERIAL.

THE BRITISH NON-FLAMMABLE WOOD COMPANY, LTD., who have recently introduced into Europe the process now being so largely used in America, have erected large works in this country, and are now taking orders for the supply of their NON-FLAMMABLE WOOD. The whole of the Carpentry and Joinery in the following notable buildings in New York, amongst others, consists of NON-FLAMMABLE WOOD:—The COMMERCIAL CABLE BUILDING, The QUEEN'S INSURANCE BUILDING, and the R. G. DUNN BUILDING



NON-FLAMMABLE WOOD has been tested by H.M. Admiralty, and large orders have been given by H.M. Government.

TRADE NOTES.

IN the ventilation of Moss Vale School, Paisley (Mr. John Hutcheson, of Glasgow, architect), Cousland's improved "Climax" patent direct-acting invisible roof-ventilators are being used, supplied by the "Climax" Ventilating and Heating Company, Limited, 93 Hope Street, Glasgow.

THE additions to the fever hospital, Bolton, are being warmed and ventilated by means of Shorland's patent Manchester stoves, with descending smoke-flues, Shorland's patent exhaust roof ventilators and inlet panels.

IN the notice of Messrs. Fletcher, Russell & Co.'s new premises which appeared in our issue of February 24, we omitted to mention that the electric lifts, to which we referred, were put in by Messrs. Archibald Smith & Stevens, of Janus Works, Queen's Road, Battersea.

"TESTS of Half a Century" is the name given by Messrs. George Price, Limited, of Wolverhampton, to an interesting booklet which they have issued, and which is entirely compiled from newspaper cuttings descriptive of fires in which their safes have successfully withstood the assaults of heat and flames, descriptions of strong-rooms, &c., erected by the firm, and letters bearing testimony to the various good qualities of the safes manufactured by them.

ARCHITECTS and others responsible for the fitting up of buildings with fire hydrants should give attention to a very efficient fire valve, which is designed to supersede the old form of valve with packed glands. It is called the "Metropole," and is made entirely of gun-metal. It is very simple in construction, very durable, handsome in appearance, and lies close to the wall. We understand that Messrs. Merryweather—the well-known makers of fire-extinguishing appliances—who are the patentees of this valve, are now fitting the Grand Hotel with them, the management having decided to employ the "Metropole" valve in preference to other makes, after exhaustive trials had been made with them all. The Hôtel Métropole has had similar valves in use for over twenty years.

VARIETIES.

THE Eastbourne Town Council have resolved to invite designs for a technical school and free library, which will cost 20,000*l.*, and is to be a memorial of the Duke of Devonshire's mayoralty.

DR. C. E. DRURY FORTNUM, D.C.L., F.S.A., one of the trustees of the British Museum, died on Monday, in his eightieth year. He was an authority on several branches of industrial art and archæology.

MR. EDWARD STANFORD has just issued a new and up-to-date map of London, showing all improvements in contemplation or in actual progress, proposed new railway lines and extensions, and much other useful and interesting information.

A MEETING was held on Friday last of the committee appointed at the ratepayers' meeting in connection with keeping open the site of St. George's Church, Liverpool. The letter of the bishop respecting the retaining of the tower and spire of the church was discussed, and a strong opinion was expressed that the whole fabric should be removed, and upon the site a neat tramway shelter and other conveniences be erected, and the space made as attractive as possible. It was resolved to ask the finance committee to receive a deputation on the subject.

BY a resolution recently passed, the London coal merchants decided to petition the London County Council to allow them in future to be relieved of the necessity of carrying weights and scales on all vehicles delivering coal except the house trolley. It is understood that a copy of the resolution has been forwarded to the Council, and that the coal merchants have hopes that the Council or the committee having charge of weights and scales will accord a favourable reception to the petition. In view of the wholesome deterrent the regulations now in force have had upon dishonest coal traders in the past, it is to be hoped that the County Council will not remove such a safeguard from London's vast army of coal consumers without giving the matter the most earnest attention. These regulations were only put in force to cope with the abuses that had sprung up owing to the knavish tricks of the coal merchant in the past.

ON the 3rd inst. the new parish church of St. Chad, Handforth, was consecrated by the Bishop of Chester. The new building takes the place of a church built about fifty years ago, and found to be unsuited to the present requirements of the parish. The style of the new church is fifteenth century, with modern detail. The walls are faced with red brick, with Alderley stone dressings to windows, doorways and buttresses. The roof is covered with Staffordshire tiles of a dark brown colour. The interior woodwork, including the open-timbered roof, is of pitch pine. The accommodation is for 300 and the total cost about 4,000*l.* Mr. Thomas Browne, of Chester, is the builder, and the work throughout has been carried out from the designs of Mr. John Brooke, of Manchester.

This Floor Spring is suitable for any sized door, and can be reg to suit any force required.

The box is watertight and weatherproof, a distinct advantage fixed in Banks, Board Schools, Libraries, and similar places, wh floors are frequently washed down.

It is also sent complete with an outer box to fix into floor, to fac the spring being taken out when necessary.

Working Models of these and other Specialties may be seen at our newly-fitted London Showrooms, 57 HOLBORN VIADUCT E. Architects and Buyers are respectfully invited to inspect same.

ELECTRIC NOTES.

T a meeting of the Hereford Town Council the electric-ighting committee reported that the Board of Trade had timated their approval of the scheme for the installation and stribution of electric light in the city, and the committee opped to have the order completed within a few days. enders for the necessary works had been advertised for.

THE Police Commissioners of Stirling have received in-mation from the Secretary for Scotland that authority has een given for borrowing the sum of 25,000*l.*, being sufficient o cover the estimated cost of Professor Kennedy's electric-ighting scheme for the burgh The contracts having pre-iously been settled, the work will be proceeded with at once. Inder the scheme mains will be laid in the central parts of the own and in a large number of the suburban thoroughfares. For public lighting the Commissioners contemplate erecting venty arc lamps in the principal streets. The electric-lighting ation will be situated on part of Burghmuir, close to the aledonian Railway, from which a siding is to be formed. It intended, if possible, to have the scheme in operation next inter.

MR. THOMAS A. EDISON, jun., son of the great inventor, is, it is said, discovered a process of hardening steel which ay revolutionise the industry. It is claimed a 6-inch plate, eated by the new process, is superior in power of resistance to 5-inch ordinary plates. Edison's is said to be also much supe-or to the Krupp process. The steel rails, Mr. Edison declares, anufactured under his process, will not spread. Tools and earings are made practically everlasting. The process is to be ept secret until after the American Government has experi-ented with it on armour plates. Mr. Edison is twenty-two ears old and was brought up in his father's laboratory.

BUILDING AND BUILDERS.

UBLIC baths are to be erected at Portobello by the Town ouncil of Edinburgh at a cost of 24,758*l.*

AT the annual meeting of the Eastbourne Master Builders' ssociation, held at Hermitage's Rooms on February 28, the eport and balance-sheet for the past year were received and dopted with thanks to the retiring officers The committee for he year was elected as follows :—Mr. Joseph Martin, president, e-elected ; Mr. E. Cornwell, vice-president, re-elected ; Messrs. I. Martin, Stanbridge, Winter, Breach, Miller, Bambridge and Lacey. It was unanimously decided to join the S.-E. Counties Building Trades Employers' Federation.

MR. MARTIN BRADLEY'S new town house in Mayfair will, says the *City Press*, be one of the finest in that favourite part of the West End. He has purchased the freeholds of 3 and 4 Chesterfield Gardens, and intends to convert them into one residence. The price for the two houses was, it is understood, about 100,000*l.*

THE Dumbarton Town Council have presented a petition to the Dean of Guild stating they are proprietors of the piece of ground in the burgh known as College Park, and are desirous of demolishing the present building thereon and erecting new municipal and police buildings.

AT a meeting of the works committee of the Edinburgh and District Water Trust held recently there were submitted five tenders in connection with contract No. 10 of the Talla Water-works. The offers ranged from 96,000*l.* to about 81,000*l.* The three lowest were from Mr. John Best, Messrs. Brunton & Son and Messrs. A. M'Alpine & Son.

MEMORIAL-STONES of new Sunday-schools, in connection with the Scotland Street Circuit of the Methodist New Connexion, have been laid at Sheffield. It is 100 years ago since the first Sunday-school of this body was opened in Sheffield, and it was largely the result of a conference held at Leeds in 1797. Some time ago steps were taken to celebrate the centenary of the schools by erecting new ones. The schools and classrooms will accommodate altogether about 800 scholars, and the cost is estimated at 3,750*l.*

THE Perth School Board have resolved to carry out a large extension on the Caledonian Road school, built only a few years ago, and the largest elementary school in Perth, to accommodate the increasing number of ex-VI. Standard scholars, at a cost of nearly 2,000*l.* Extensions and alterations costing about the same amount have been considered necessary at the Northern District school. The Central District school is also to be rebuilt at a cost of between 7,000*l.* and 8,000*l.* ; and large extensions on the Southern District school, at a cost of about 3,000*l.*, are nearing completion.

A SERIOUS accident has happened at Mr. Forder's cement works at Sundon, near Luton. Some men were working in a new kiln, when the roof suddenly collapsed, and a heavy mass of bricks and mortar completely buried six men. George Garner, of Toddington, was found dead. Two other men, named Creamer and Sanders, were severely injured, and con-

veyed by special Midland engine and van from Harlington to the hospital at Luton in a critical condition. Three others were hurt.

AT a Dean of Guild Court, held at Ardrossan on Monday, plans were passed and warrant granted for the addition of a laboratory, a workshop and classrooms at Ardrossan Academy. The academy was recently transferred from trustees to the School Board, and the intention is to run it on the lines of a secondary school. The alterations proposed are estimated to cost over 2,000*l.*

NEW CATALOGUE.

MESSRS. DAVID WILSON & CO, of 77 Lever Street, Goswell Road, have sent us on a copy of their new illustrated price list, which contains sketches of their specialties in cooking apparatus for gas, steam and coals, comprising grills, hot closets, steam boilers, steamers, jacketed pans, gas roasters, gas grillers, gas stoves, gas hot closets, charcoal grills, dinner lifts, kitchen ranges, &c. Conspicuous among these is their "Portable Table Range," specially suitable for hotels, restaurants, public institutions, schools, &c., which is remarkably comprehensive and complete. It measures 13 feet by 7 feet 6 inches, has a central flue and ventilating shaft, with hot-plate constructed throughout of heavy cast-iron, and fitted with six ovens and two fires. There is a hot closet with sliding doors at one end, with a bain marie over, and at the end a three-drawer nest of potato or vegetable steamers, fitted with steam-tight doors. A strong welded wrought-iron boiler is placed at back and sides of one fire for generating steam, with branches connected to hot closet, bain marie and steamers, and fitted with complete set of mountings comprising automatic feed valve, safety valve, pressure gauge and gun-metal water gauge cocks.

Their portable cooking range has been specially designed to suit the requirements of those who want a good roasting oven and a plentiful supply of hot water for scullery, bath-room, &c. It is made of heavy metal, and is fitted with a strong wrought welded high-pressure boiler, with arch flue at bottom, in which is fitted an independent damper, so that the whole fire can, if desired, be made to play on front, under and back of boiler. Flow and return pipes come on top, so that connections can be made to any existing pipe in a few minutes. The other ranges and stoves described offer a large variety, and among them will be found some suitable for all purposes.

ILLICIT COMMISSIONS.

THE following report from the special committee on Secret Commissions of the London Chamber of Commerce has been issued this week:—

Gentlemen,—Your committee at its first meeting elected Mr. David Howard, J.P. (vice-president of the Chamber), and Mr. Walter Hazell, M.P., chairman and deputy-chairman respectively of the committee, and also added additional representatives of trade and professional associations apart from the Chamber and other gentlemen to their number, to make the committee more thoroughly representative. No less than twenty of the trade sections of the Chamber were represented on the committee by either their chairmen or deputy-chairmen.

2. With a view to obtaining evidence as to the prevalence of secret commissions in the various trades, and the extent to which the same obtained, the committee caused communications to be addressed to the members of the Chamber, the various trade associations, Chambers of Commerce, and also to the general public by the insertion of a letter published in the various trade papers and the press generally, asking for information.

3. In response to these invitations, your committee received numerous communications on the subject, both written and verbal. Most of them were received under a promise that they would be treated as strictly private and confidential, but in a few cases the persons giving the information were not unwilling that their names should appear.

4. Your committee much regret that in this way only were they able to obtain information, as they are fully conscious of the value which would attach to communications made public with all particulars and substantiated by the names of the parties communicating the same. The information thus furnished to your committee is, of course, varied as regards its character; in some cases it has been vague, in other cases specific, but in no case has your committee come to a conclusion except upon evidence which they believe to be trustworthy.

5. Your committee conclude from the evidence before them at secret commissions in various forms are prevalent in most all trades and professions to a great extent, and that in me trades the practice has increased, and is increasing, and ey are of opinion that the practice is producing great evil, ike to the morals of the commercial community and to the ofits of honest traders.

6. Bribes in all forms, including secret commissions, owe eir existence sometimes to the desire of the donor to obtain e assistance of the donee; sometimes to the demand ex- essed or implied of the donee that the bribe shall be given.

7. In the first class of cases your committee have reason to lieve that the bribe is often given unwillingly and with a pang conscience, as the result of the keen competition in trade, d in the fear, too often well founded, that unless given other ss scrupulous rivals will obtain an advantage; many cases ve come before your committee in which traders have lieved (often though not perhaps always without reason) that eir entire failure to obtain orders has been due to the want of bribe.

8. The second class of cases are those in which the cipient extorts the bribe from those who have established siness relations with his principal. The practice is rendered ore effective and oppressive by a combination between the ackmailers. The servant or agent who demands a commission d fails to receive it, not infrequently warns his fellows in the me position in the trade against the honest trader, who thus ds himself shut out from dealings with a whole circle of firms.

9. In stating the result of the information received in rela- n to the several trades, and also to some professions, your mmittee do not wish to suggest that these practices are by y means universal in any trade or profession.

10. The bribes given naturally take many forms; most nerally they are given in the simple form of a money pay- ent, the worst form of which is a *pro rata* commission on the siness done; sometimes in the shape of a loan, which places e borrower at the absolute mercy of the lender, who, if he be ssatisfied with the amount of custom he receives, can call in, threaten to call in, the loan; sometimes the bribe consists presents of plate, wine, or other things, and not infrequently is administered in the form of lavish hospitality and treating.

11. One frequent practice with those who venture to put eir offer of bribes on paper is to describe the sum offered as "discount," though the offer is made, of course, not to the incipal but to his agent.

12. The mass of corruption which the evidence before the committee shows to exist may appear to some persons so great and complex as to render it hopeless to struggle towards purity. Your committee do not take this view of the matter. They believe that the discussion of the subject and the publicity of some cases before the Law Courts have already done some good; and they recall the undoubted fact that corruption formerly existed in this country in regions where it is now entirely unknown, that there are cases in past times in which bribery threw a stain upon occupants of the Bench, that at one time a large number of the members of the House of Commons were in the pay of the Crown, and that commissions and other secret forms of bribery abounded in Government departments. Your committee accept the improvement which has taken place in these directions in the last fifty years as a fact full of encouragement for the commercial community of Great Britain. The question of whether it is desirable to introduce legislation to check the abuses which still remain has been considered by your committee. On the one hand, it is forcibly urged that the Act of Parliament which makes criminal all bribery occurring in the case of officers of Government Departments and public bodies, has produced advantageous results; and that many persons who allow themselves to be parties to an illegal transaction would shrink with fear from the same transaction when made criminal. On the other hand, several difficulties present themselves in the way of effective legislation. In the first place, it is never safe for criminal legislation to advance very far beyond the public conscience, and it is doubtful how far that conscience is yet enlightened on the matter; in the next place, it would be a matter of difficulty to define the offences with adequate breadth without including acts of an innocent or trivial character; and lastly occurs the consideration that the transactions aimed at are very often secret, and that it would be difficult to obtain confirmatory evidence, and unsafe to convict on a single unconfirmed oath.

13. If legislation is to be attempted it appears to your committee that it should render criminal the payment, the receipt, the offering and the solicitation of any corrupt payment; and also the giving of any invoice or other document calculated to enable the recipient to commit a fraud upon his principal, and that it is expedient that such legislation should be initiated by your Chamber or supported by a petition by them.

14. Your committee submit that the question of the desir-

ability of legislation should be fully and immediately considered by the Chamber, and that if an affirmative conclusion be arrived at, the matter should be remitted to a committee for the preparation of a suitable Bill, with such assistance as they may think proper to invite.

15. But meanwhile, and independently of legislation, it appears to your committee that much may be done if only the community will rouse themselves to the task. Your committee make with this view the following suggestions :—

16. The more frequent enforcement of the civil rights of the principal ; and they are advised that these rights may be thus stated :—

(*a*) A master or principal may recover from his servant or agent everything which has been received by him by way of secret commissions in the course of his service or agency, and if the accounts have been settled between the principal and his agent, and it can be shown in a single instance that the accounts are tainted with fraud or wilful omission, the accounts may be re-opened, and the agent be required to restate and verify them by oath.

(*b*) A master or principal may as a general rule dismiss without notice, or without payment in lieu of notice, any servant or agent who has received and not disclosed a bribe.

(*c*) A contracting party may repudiate and rescind any contract entered into through an agent who has received a bribe from the other side.

(*d*) A contracting party may recover from the briber and the bribed, or either of them, any sum which he has paid under the contract, and which in consequence of the bribe was in excess of the fair or market price.

(*e*) A contracting party whose agent has been bribed by the other party during the execution of the contract may, in spite of its being part performed, rescind and recover what he paid, both to the briber and the bribed.

17. The great benefits which may be derived from the enforcement of the appropriate civil remedy have been forcibly shown by the experience of a member of your committee, Mr. Oetzmann, the plaintiff in the well-known case before the Lord Chief Justice, who says :—

"My firm have had some experience in recovering sums of money from manufacturers and others. The most notorious case we had was Oetzmann *v.* Long. We had, however, found out others before that case. We compromised one case, in which we recovered about 15*l.* sums paid to our then late buyer. In Long's case we recovered about 120*l.*, and a considerable sum more as damages and costs. After Long's case we took up one or two others, in one of which we got 120*l.* before the issue of the writ, and in the other case we recovered 300*l.* after the issue of the writ with full costs; but that does not represent anything like the benefit we have received. We have benefited immensely by being able to buy cheaper. Immediately after Long's case we had many manufacturers calling upon us, some of whom we knew before, others of whom were more or less unknown, but who all said, now there is a chance of their doing business with us. In nearly all cases we were able to buy direct from the manufacturers, thus saving the middleman's profit."

18. Your committee further suggest:—That all professional and trade bodies (such as those representing the medical, legal, artistic and other professions and trades) be recommended to make an emphatic declaration on the subject of secret commissions and adopt the course already taken by the Royal Institute of British Architects, the Institution of Civil Engineers and other bodies, by inserting into their by-laws a stipulation that any member guilty of the pernicious practice will be expelled the Society by the Council. In order to make such a provision effective this would require the aid of the general public, as well as of the members of the several professions and trades.

19. That traders should make with all with whom they deal a definite agreement, similar to that entered into by the members of the Calico Printers' Association undertaking, that nothing in the form of a bribe, commission or present shall be offered or given by them to any one.

20. It would be highly advantageous if masters and principals when entering into engagements with servants and agents would call attention to the subject and make the refusal of all bribes an express instead of an implied term of the contract of service or agency. Such an explicit stipulation would probably give moral as well as legal support to servants and agents in resisting the temptation when offered under the pretence of a thing which is always done.

21. Your committee are of opinion that much good in many cases may be done by circulars or notices warning against the payment or receipt of bribes. In one case a nurseryman is in the habit of issuing a notice to all gardeners of his refusal to pay commissions on orders; in another case another of your committee having discovered the misdeeds of one of his buyers addressed a circular on the subject to all the firms from which he was in the habit of buying. In some cases notices have,

your committee believe, been circulated by householders amongst the shops serving them warning them against the payment of commissions to the servants employed, and corresponding notices by the tradesmen to the servants of the houses which they supply would be useful.

22. Something may be done to check commissions by the exercise of increased vigilance on the actions and proceedings of the servants and agents employed, especially of buyers and salesmen and of persons employed to inspect and pass goods. If principals would always inquire for themselves why goods were refused, or why advice is given hostile to the particular manufacturers or tradesmen, they would sometimes find that the defect was not in the goods, but in the bribe. This necessity for vigilance applies with special force to the case of large institutions, such as workhouses, hospitals, asylums and to large commercial joint-stock concerns, such as railways and to co-operative stores.

23. In many cases buyers and others who are employed in very responsible positions and have very important duties to perform are paid inadequate salaries, and are thus rendered especially liable to the temptation of accepting bribes. This, in our opinion, demands the careful consideration of the heads of firms.

24. The existence of a great system of technical education throughout the country should be utilised as a means of disseminating clearer views than often exist of the immorality of the giving and receiving of bribes. The managers of these institutions would, no doubt, give the necessary permission and allow influence in the right direction to be brought home to the young people in their schools, whether by means of written papers or of oral addresses.

25. Lastly, your committee recommend the holding of a public meeting to call the attention of the public and all concerned to the heinousness of the system of secret commissions and its detrimental effect upon morals and business.

DAVID HOWARD, Chairman of Committee.

Adopted by the Council of the Chamber, July 7, 1898.

THOMAS F. BLACKWELL, Chairman of Council.
KENRIC B. MURRAY, Secretary.

SMALL HEATH BATHS, BIRMINGHAM.

THE Corporation of Birmingham are about to erect public baths at Small Heath. In July 1897 an estimate of cost was prepared amounting to 25,000*l.* A revised estimate was lately given. The *Birmingham Post* gives the two :—

The plans of the proposed baths were approved by the Council on July 27, 1897, and the estimate then submitted and also approved was as follows :—

1. Buildings, stack and boiler-house, including drainage, excavation and builders' work, complete ...	£16,000	1. Buildings, stack and boiler-house, including drainage, excavation and builders' work, complete (actual tender)	£26,475
2. Dwelling-house for resident engineer ...	400	2. Dwelling-house for resident engineer	
3. Engineers' work, viz. steam-engines and boilers, pumping machinery, hot and cold water services, enamelled baths, pipes, valves and fittings, complete ...	3,250	3. Engineers' work, viz. steam-engines and boilers, pumping machinery, hot and cold water services, bath, pipes, valves and fittings, complete	3,000
4. Cold-water reserve-tank, girders and supports	1,100	4. Cold-water reserve-tank, girders and supports, overflow, rising mains, valves, pipes and connections	1,100
5. Well and bore-hole	2,000	5. Well and bore-hole...	2,100
6. Electric-lighting plant, electric bells and internal fittings required in the several departments ...	750	6. Electric-lighting plant and internal fittings required in the several departments and branch library buildings adjoining	1,250
7. Architect's charges and clerk of works' salary	1,000	7. Architect's and quantity surveyor's charges, lithography and clerk of works' salary	2,200
8. Extras and contingencies	500	8. Builders' extras and contingencies ...	575
		9. Engineer's extras and contingencies ...	300
	£25,000		£37,000

The committee now submit the following revised estimate:—

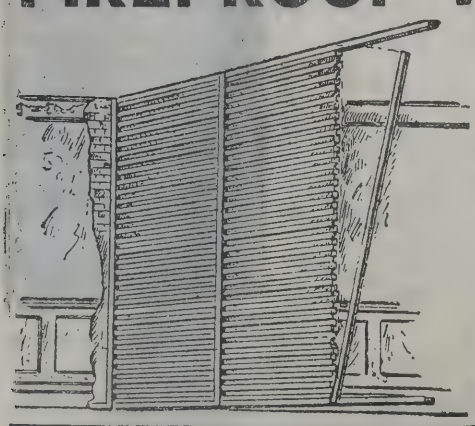
The committee requested the architect (Mr. Henry Martin) to supply them with an explanation of this large increase, and they have received from him the following report:—"The estimate given for this work in July 1897 was approximate only, and was based on a comparison of area and cost of the baths erected by you in Monument Road, as supplied to me at that time, and by the further assistance of a rough ground plan and a sketch elevation of the Green Lane frontage only, prepared at very short notice, there being then no other drawings prepared of any description."

At the meeting of the City Council on Tuesday Mr. S. E. Johnson, on behalf of the baths and parks committee, moved "That the minute in reference to the erection of baths at Small Heath be rescinded, and that the committee be authorised to accept the tender of 37,000*l.* from Messrs. B. Whitehouse & Sons for the erection of the baths." The expenditure on the suite of baths originally sanctioned was set down at 25,000*l.* He wished to say emphatically that the committee had not pledged the Council to any expenditure, and that they had not bought a single brick. The increase was due in a great measure to the advance in the price of labour and material. The committee were desirous of having a bath which would be pointed to as an example to be followed by other towns. The existing baths cost nearly ½*d.* in the pound, and this addition would not cost ¾*d.* in the pound.

Mr. Marsh, who seconded the motion, repudiated the idea that the committee and their servants were to blame for what had happened. Their instructions to the architect were distinct and definite. In June 1897 they were informed that the building would cost 22,000*l.*, and they asked for 25,000*l.*, but he was thoroughly convinced that in view of the present price of material and labour the work would not be done cheaper than the present estimate.

Mr. Lancaster moved as an amendment, "That in the opinion of this Council the sum of 25,000*l.*, sanctioned in July 1897 for the baths at Small Heath ought to be ample for that purpose, and this Council refers the report back to the committee to reconsider their estimate and report." He said he had never known an estimate jump up 60 per cent. in eighteen months. An architect who could not give an estimate within 10,000*l.* of the actual cost was not fit to carry out work of that character. He could not trust such an architect, and the committee ought not to.

Mr. Lane seconded the amendment, and Mr. Murray supported it.



Alderman Cook said it seemed clear from the speeches of the chairman of the committee and Mr. Marsh that they were convinced that the report would not be adopted. They had excused the committee and its servants, and had made an onslaught on the architect. He could not now see how it was possible for that committee to bring up another scheme from the same architect, nor could he conceive how the architect could complacently work for the committee, especially in connection with those baths. The better way, therefore, would be to refer the report back for further consideration, the committee understanding that they should start again with a clean sheet. He did not suggest that full justice should not be done to the architect. He should be properly paid for what he had done, but he (the speaker) could not conceive how satisfaction could be given unless they got an entirely fresh architect and an entirely fresh set of plans.

Mr. Baker pointed out that the committee had no choice respecting the architect. He was selected for the purpose of building the free library at Small Heath, and it was understood that the baths committee were to take the same architect, in order that the building might be in character with the library. He, for one, never believed that the baths could be built for the sum mentioned, but they had the emphatic assurance of the architect that they could. Turning to the character of the building, he defended the proposals with respect to the internal fittings. The tiles would be a great saving in the cost of maintenance. For instance, they spent 20*l.* a year on Monument Road Baths as compared with 70*l.* on Kent Street, though they ought to spend 100*l.* a year on the latter place to make it decent. The gallery had been proposed because they understood the Council desired it. Were they, he inquired, to take out any of those things? He advised the chairman of the committee to accept the amendment.

Mr. Adie also thought it advisable that the report should be reconsidered.

Mr. Balden, as one of the representatives of Bordesley, expressed his desire to have the baths erected as soon as possible, but he could not vote for the report. He therefore moved, as an amendment, "That the report of the baths and parks committee be referred back, with instructions to confer with the quantity surveyors in consultation with the architect as to whether it is possible to effect any alteration in the plans, and consequently a saving on the estimates, without in any way

npairing the stability of the proposed baths." He pointed out hat a serious thing it would be to take the matter out of the ands of the architect. Doubtless he had committed an error f judgment, but there were cases in which such an error should ot be visited too heavily on a man. It was a pity to bind the ommittee down to 25,000*l.*

Mr. Jephcott seconded this amendment.

Mr. Randall pointed out that in the report of July, 1897, ne gallery round the bath was mentioned, and therefore pro- ided for.

Alderman Barratt moved a further amendment that the eport of the committee be referred back for further considera- on, with a view to reducing the cost to as nearly as possible 5,000*l.*

Alderman White agreed that it would be proper to take the eport back.

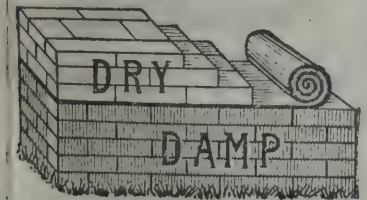
Mr. Stembridge seconded Alderman Barratt's amendment.

The Lord Mayor inquired what was the mind of the Council n the question of employing another architect. The position as that they had employed an architect, and if they did not ake his work the rule of the profession was that he should be aid 2½ per cent. on the amount of his estimate.

Mr. Lancaster: On his original estimate.

The Lord Mayor having assented, proceeded to say that ney had had the quantities taken out, and the quantity urveyor would have to be paid on the builder's tender. That ork would be thrown away providing they had a new rchitect, because the present quantities would be of no se for fresh plans. Therefore, if they adopted the suggestion o go to another architect, it meant that at least 900*l.* was gone bsolutely. The explanation of the whole thing was very imple. The committee in 1897 brought out a report which mbodied the reports of their architect and of their engineer, nd on that the Council sanctioned an expenditure of 25,000*l.* n his report the architect mentioned the details and gave an stimate. He (the Lord Mayor) had seen the letter which eferred to the calculations of that estimate. The mis- ake was made in taking out the cubic contents on the asis of Monument Road, and the result was a figure lower nan that for most buildings with which he (the Lord Mayor) had had anything to do with the erection. The whole thing went wrong because too low a unit was aken. The extensions were immaterial, and the glazed bricks ormed part of the original plans. Would the committee, how- ver, do better by throwing over the architect and taking some- one else? He did not think they would get baths for 25,000*l.*, and if the committee accepted the amendment it would only mean that they would have to come back to the Council and say that they could not afford the accommodation for the money. He did, however, believe that a great deal might be cut out of the specification. There need be no ex- pensive ornamental elevation to two streets, and in other directions he was informed reductions might be made. The same architect built the free library, and the result was only 5 per cent. above his estimate. They were not without experi- ence in Birmingham of a similar mistake. In connection with the new general hospital they had to use the pruning-knife.

Mr. Lancaster pointed out that his amendment did not tie the committee down to 25,000*l.*



Alderman Parker thought a great deal of time would be lost if they employed a new architect, and if the present one was prepared to cut down to meet the feelings of the Council he should be retained. If not, then the committee would be justified in adopting another course.

The Lord Mayor intimated that the architect had expressed himself willing to go into the plans from that point of view.

Alderman Barratt's amendment was lost. At first the Lord Mayor announced a tie with respect to Mr. Balden's amend- ment, but on names being taken it was lost—twenty-three members voting for it and twenty-five against. The Chairman of the committee accepted Mr. Lancaster's amendment, and it was adopted as the substantive motion.

A MEETING of the Lancashire and Cheshire Antiquarian Society was held on the 3rd inst. at Chetham's Hospital, Man- chester, Mr. T. R. Sutton presiding. A paper was read by Mr. W. H. Sutcliffe on some recent explorations on Hades Hill, near Rochdale. He described the contents of a barrow discovered by Mr. J. T. Hill, Shawforth, including an urn and some burnt human bones. The absence of metal in the barrow pointed, he said, to the conclusion that it was formed before the Bronze Age of this neighbourhood, and that the urn was the work of the same race that made the flint implements found on the Rochdale Neolithic floor. The date could not be safely fixed, but it was very remote. Mr. Hill very kindly proposed to hand over the whole "find" to the March collection of flint implements in the Rochdale free library.

PATENT
VULCANITE ROOFING.

Since the introduction of the patent Vulcanite Roofing into this country it has been adopted by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospitals, Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summer than under any other roof. When properly laid repairs are never required, and all roofs are guaranteed. The roof-surface can be used as a garden, or for any other purpose. The cost of construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGES, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to 40 inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower and quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and for SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 super- ficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires no annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.
THE PATENT VULCANITE ROOFING & ASPHALTE CO., LTD.,
OLD FORD, BOW, LONDON, E.
Inquiries from the North of England, Scotland, and Ireland, please address to Laganvale, Belfast.
Agents wanted in all districts where not yet represented for laying of Vulcanite Roofs and Sale of Sheet Asphalte.

Vol. LX. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered. Price 12*s.* 6*d.* Office: Imperial Buildings, Ludgate Circus, E.C.

THE BUILDING TRADES EXHIBITION.

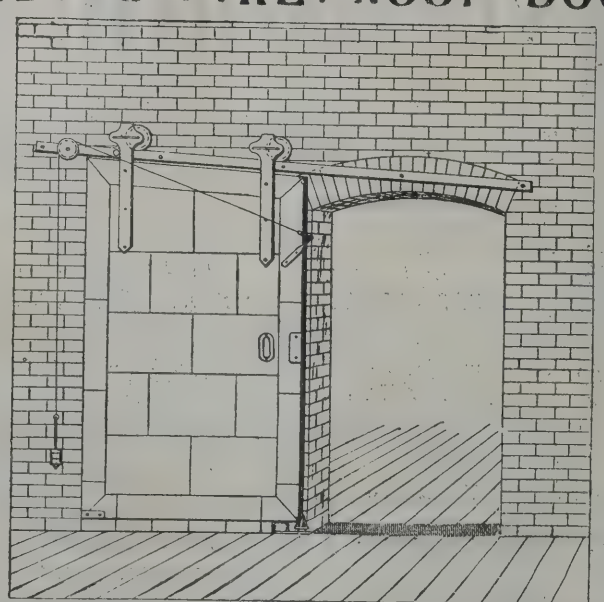
THIS year's Builders' Exhibition, which promises to be a record one, will be opened on April 26 by Professor Aitchison, R.A., F.R.I.B.A., supported by Sir Arthur Blomfield, R.A., Mr. E. Vigers (president Institute of Surveyors), Mr. G. F. Fellowes Prynne (president Architectural Association), and most of the leading architects in London.

Special features of this year's exhibition will be the electrical section and the smoke abatement section. In the latter of these gold, silver and bronze medals and certificates will be awarded for the best domestic appliances obviating the smoke nuisance. These medals have been officially designed by Sir W. Richmond, R.A.

SOME USEFUL INVENTIONS.

MESSRS. WALLACH BROS, of 57 Gracechurch Street, E.C., are the proprietors of some very ingenious safety appliances which deserve to be better known than they at present are. Foremost among these we may mention their patent Automatic Belt-lifting Apparatus, by means of which slipped belts can with facility be replaced on the moving pulleys or drums without the dangerous necessity of climbing a ladder or otherwise jeopardising the safety of the operator, which has been many times the cause of serious and, not infrequently, fatal accidents. This appliance is very simple in construction and manipulation, is comparatively very inexpensive, and by its means a pulley can very quickly be replaced. Another fruitful source of danger is obviated by the use of their patent Gauge-glass Protector, which is an effective safeguard against injury by broken glass thrown about by the bursting of gauge-glasses. The "Evertrusty" gauge-glass protectors, made by a patented process from the best quality of clear white glass, toughened, and having strong wire netting embedded therein, will stand almost any pressure or shock to which they may be subjected through gauge-glasses bursting behind them. Tests of the severest character have demonstrated that glass made in the manner described is unapproachably the most suitable shield which can be interposed between gauge-glasses and the boiler attendants or other persons in the vicinity. To show that these protectors are the most efficient and reliable in the market, it is only necessary to mention that, whereas ordinary toughened glass has been known to fly at a pressure of 40 lbs., the protectors under notice have not been in the least injured by shocks developing a pressure of 440 lbs. (nearly 30 atmospheres). A further advantage is that, even if the glass of the protectors were to be injured, it would not fly, owing to the presence of the embedded wire, an advantage which is sufficiently obvious.

Messrs. Wallach's "Evertrusty" Draught Indicator, by means of which the exact draught pressure in boilers, &c., flues, can always be determined at a glance and a constant minimum pressure maintained, resulting in the most efficient combustion of a minimum quantity of fuel, although a very efficient is a very simple apparatus, consisting of a light metal case with a dial face, on which is indicated the amount of draught produced by the combustion of a given amount of fuel, thus informing the fireman when to open or close the dampers; he is thus enabled, without extra work, to reduce his employer's expenditure for coal to the smallest possible limit.



THE GREAT DAM AT ASSOUAN.

ACCORDING to the *Egyptian Gazette*, the preliminary work necessary before the actual construction of the permanent dam can be even commenced began as soon as the contract was signed about the middle of last February. Immediately the necessary legal formalities had been completed plant of all descriptions poured into Assouan and Assiut. The contracts for the delivery of the material were entered upon at once, and the machinery was not long in arriving. All the machinery was sent direct from England. In fact, every piece of machinery, plant and material was of English make, so Egypt can rest content that she has had all that the best engineering workmanship in the world can produce. The plant began to arrive at Alexandria in March, and before the end of that month a great deal had arrived at the first cataract. Most of it was taken from Messrs. John Aird & Co.'s reserves of plant in England and elsewhere. At the same time buildings arose with extraordinary speed amidst the waste of desert and granite that stretches from Assouan to Philæ. Surveyors also appeared on the scene and the preliminary surveys were made. All this took place barely within a month after the contract had been signed. There was not a single moment's delay. Although the work is to take five years not a day had to be lost, for this enormous undertaking is of vital

nportance to Egypt. Thus it was that the ink on the contact had scarcely dried before the Nubian Valley was filled ith an animation that it had not seen since the granite quarries the first cataract swarmed with the workmen of Rameses the reat. As soon as these first steps had been made the workmen began to arrive. Arrangements for getting the hands gether were commenced in March, and ever since then reams of Italians have been coming to Shellal. The rm has agencies established throughout Italy, chiefly Turin, for engaging these men. The granite at the st cataract is hard and requires special, skilled men to ork it. Of course there are any amount of granite-workers in e neighbourhood of Aberdeen who are just as good as the alians. But the expense of getting them here would be eater, their wages are higher and they would be less able to and the heat than the Italians. These men are all picked orkmen. They come chiefly from the great granite districts Baveno, on the Lago Maggiore and Biella, in the neighbourood of Turin. As soon as they are engaged they have their res advanced to them, and come out direct. There are now out 350 of these men, but this number will be trebled as e work advances. The firm are very contented with their alian workmen. They look a fine set of men, and their beaviour is excellent. The rest of the men are Maltese, Syrians, reeks and Arabs. There are also a few Soudanese. It is a rious thing that the local Nubian has been found to be solutely incapable as far as this work is concerned. The he and sinewy fellows that work so hard dragging a habeeyeh up the cataract cannot stand settled labour. They e only useful as boatmen, and it has been found simple aste of money to employ them, Consequently all the native bour has to be imported from Upper and Lower Egypt. The llah is a good workman, and agents are continually travelling roughout the country selecting capable men and drafting em down to Assouan. The pay of the natives is quite double e ordinary wage rate for such labour in Lower Egypt. Owing the desert that extends along the banks of the river in the eighbourhood of the first cataract, the firm has to find ccommodation for every man it employs. Some idea of the ousing of these men may be gathered from the numbers that e employed. These workmen are over 4,000 in number. he maximum number of labourers that will be employed will e between 7,000 and 8,000 at Assouan alone. Together with e hands at Assiut they will reach the enormous total of 6,000 men. These men are cutting up the very stone that was worked in the age of the Pharaohs. Oftentimes the marks of wedges used thirty centuries ago are found on blocks of granite that are being quarried to-day.

Twice a day a tremendous cannonade is heard. This is caused by the blasting operations. The explosive always made use of is gelignite. There are no less than twenty-two quarries for dressing granite ashlar, and there is a countless number of quarries for procuring rubble. The whole structure will be formed of granite. The excavations are being carried down to the bed-rock in order that the dam may be able to withstand the hydraulic pressure that it will have to bear. No actual masonry has been yet begun. All efforts are being concentrated on the work of getting down to the bed-rock. The actual building of the permanent dam will, however, commence in a few weeks' time.

After the plant commenced to come out from England the next great task was to build lines of railway to and from every point of the works. Then these lines had to be connected with the short but important line that unites Assouan to Shellal. At the present time about five miles of railway have been constructed. A large amount of coal is used on these railways and elsewhere in the works, and nearly all of it comes from England. The limestone for making the mortar, which, of course, is a most important item in the work of construction, comes from Reghama, south of the ancient sandstone quarries of Gebel Silsileh, from which the blocks used in the greater part of the Egyptian temples were taken. There is a very large quarry here, and hundreds of men are at work cutting out the limestone. As soon as the stone has been quarried it is sent up the river on boats to Assouan. Although a large quantity of limestone will be used for mortar the greater portion of the dam will be built of Portland cement. Another important part of this great hive of industry that has arisen as if by magic in the desert is the staff and special workmen. We have dealt above with Arab and ordinary labourers, but there is an enormous mass of trained men besides. There are quantities of civil engineers, mechanical engineers, carpenters, stone masons, stone dressers, quarrymen, blasters and miners. Then there is the staff. At the present time it numbers about fifty or sixty, but it is constantly being increased. The clerical staff is divided into the pay department, draughtsmen and timekeepers. The medical staff is also a necessary result of this great agglomeration of human beings. There is a complete hospital on the works, and a very nice, airy building it is. It contains about three dozen beds and a permanent medi-

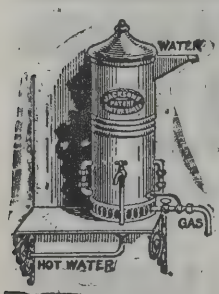
Vol. LX. of THE ARCHITECT. Handsomely bound in Cloth. Price 12s. 6d.

cal staff, and a number of nurses are attached to it. Another important department is the catering. When we paid a visit to the neat building which contains the restaurant we saw a table d'hôte ready laid which would have done credit to a first-class hotel. Adjoining the restaurant there is an excellent billiard-room for the amusement of the staff and their friends. Close by are large dining-rooms for the Italians and the other European workmen. The natives employed on the works mess themselves, but large quantities of bread are made for the Arabs, as, owing to the neighbourhood being almost totally uninhabited, they would otherwise have to go all the way to Assouan for their bread. Not only food but shops are also required, and quite a bazaar has arisen in the formerly deserted spot. Here are now spruce-looking shops; tailors, shoemakers, grocers, butchers and other shops have been set up. A café and a very respectable looking public-house have also been set up. There are also branch shops scattered over the works for supplying the men in the various parts of the work with provisions. A church is being built on the works. This edifice has not been finished yet, but will be ready for worship in a week or so. It is a charming little building, and is intended to chiefly satisfy the spiritual wants of the European workmen. Another important department is the police service. Owing to the great number of men of all nationalities and all classes who are engaged on the works, it is very necessary that precautions should be taken to prevent any disturbances breaking out. Police quarters are now being built. A resident officer and a staff of policemen will be quartered there permanently. The conduct of all the workmen has been excellent up till now.

It is impossible to enter into the financial details of the work at the present time, for everything depends on how far it will be necessary to go down in order to get to firm foundations. The works will take the full time specified in the contract before they are complete, and so there is another four years to run yet before the dams will be in working order. As soon as the season of the High Nile begins the work in the river will cease. A considerable portion of the construction, however, comes above the level of the Nile flood, and work will be continued without intermission on this part of the work. At the same time there will be plenty of work to be done in making preparations for commencing work in the river as soon as it begins to subside and also in getting everything ready for next season.

Sir Benjamin Baker, K.C.M.G., LL.D., F.R.S., who was the joint engineer of the Forth Bridge, is the consulting engineer for the works, both at Assouan and Assiut. Sir Benjamin is now in Egypt, and, in company with Sir William Garstin, K.C.M.G., and Mr. John Aird, M.P., has visited the works. The director-general of the two reservoirs is Mr. Wilson of the Irrigation Department. Mr. Fitzmaurice is the resident engineer at Assouan.

Mr. John Aird put in an appearance at the House of Commons on Monday for the first time this session, having arrived in London on Friday night after a somewhat prolonged visit of inspection to the works which are in progress under his direction on the Nile. The hon. gentleman, says the *Times*, who received a cordial welcome, states that the excavations at Assouan and Assiut have now been carried far enough to enable a start to be made with the actual foundations of the dams, the construction of which will, it is expected, be entered upon next week. To give an idea of the magnitude of the scheme, it may be noted that 6,000 workpeople are already employed at Assouan, and between 2,000 and 3,000 at Assiut, 90 per cent. of these being natives. Amongst the Europeans engaged are some 500 Italians, of whose industry and skill Mr. Aird speaks very highly. Before returning to England the member for North Paddington had an interesting interview with the Khedive, who was much gratified to hear that the work of the Egyptian labourers was giving great satisfaction to the contractors.



SEWER GAS.

THE following directions for dealing with foul gas in sewers have been prepared by Mr Joseph Corbett, the borough engineer, for use in the county borough of Salford. Whenever men have to go down into an old and foul sewer or cesspool the following precautions must be taken:—

1. Open the lids of two adjacent manholes so as to provide a down-cast and an up-cast shaft; or if only one manhole is available and there is no other outlet by an open sewer or vent pipe, place a wooden tube about a foot square down the one manhole for use as a down-cast shaft.

2. Use one manhole, or the wooden pipe above described, as a down-cast shaft, by means of a heavy shower of water from a large watering can with a rose jet, or else from a rose jet on a hose pipe from the town's water mains.

3 Where there are two manholes near together, use one for the downcast shaft, by means of the shower of water above

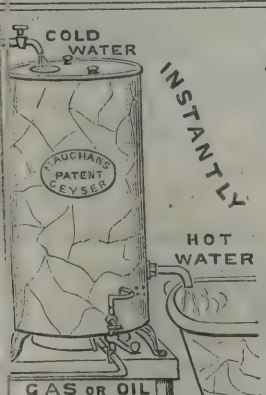
scribed, and use the other for the hoisting and working aft.

4. Test the air in any shaft before men go down it by vering a lighted candle down it. If the light burns dull, en without going out, the shaft must not be entered. Venti- e the shaft as before described and test it again; and do t enter it until a light will burn brightly in it.

5. Beware of any mixture of combustible or explosive gas the sewers or their manholes, and if any signs of such gases e found, obtain skilled men and safety lamps from some lliery, and let those men direct the work, giving them the lp of ventilation, &c., as before described.



6. When a man has to descend a risky manhole or shaft he ust have a strong rope properly tied about his shoulders, so at he could be lifted by it, and the rope must be kept in nd ready to lift him up if he becomes overpowered by the s.

When a man has to crawl along a risky sewer he must have short rope securely tied to his ankles, and a rope from it to nd so as to draw him back if he becomes overpowered by le gas.

7. In any case of special difficulty or danger, report the se immediately to the borough engineer, so that he may take le responsibility of the work.

A MORTAR-MILL AS A FACTORY.

JDGMENT has been given in the Court of Appeal in one of le most important cases arising out of the Workmen's Com- pnsation Act, viz McNicholas *v.* R. F. Dawson & Son. The llowing report is taken from the *Times*:—The case raised vo questions of importance, one being of considerable diffi- ulty owing to the Act defining "factory" by reference to the ovisions of the various factory Acts. The appellant was the idow of a deceased workman named Patrick McNicholas, ho at the time of the accident causing his death was a work- an in the employment of the respondents, Messrs. Dawson & on, who were builders engaged at the time in erecting a post- fice and some other buildings. McNicholas was employed to ok after a steam-engine in an engine-shed and a mortar-pan, s duty being to fire the boiler, to start the engine and oil it, nd to oil and feed a mortar-pan, which was outside the engine- hed in the open air. The engine was used for grinding mortar r the post office, from which it was distant about 20 yards. Across the middle of the engine-shed was a revolving shaft worked by the engine and placed about 4 feet from the ground. The engine-shed had a full-sized door at the side furthest away from the mortar-pan, and there was a small door 4 feet high at the side of the shed nearest to the mortar-pan. This small door was sometimes used for ventilating the engine-shed, and it opened from the inside, and the man workmg at the engine would have to pass under the shaft to go to this door. The deceased man had been forbidden to go out of the shed by this small door. Upon the morning of August 6, 1898, at about 6.55 A.M., the deceased man called to an outdoor labourer named Smith, who was employed at the mortar-pan, asking him if he was ready, and upon being answered in the affirmative the de- ceased man started the engine, and about two minutes afterwards Smith heard a rattling noise, and upon going into the engine- shed he saw, as he stated in his evidence, a bundle going round the shaft, and he stopped the engine and found it was the deceased man, who died shortly afterwards. No one saw how the accident happened. It was the duty of the deceased men after having started the engine to go to the mortar-pan. The evidence showed that the proper way to the mortar-pan was by the main door, and that if the deceased man wished to go out by the small door he would have to creep under the shaft in order to reach it. The oil can used for oiling the engine was found on the shelf where it was kept when not in use, thus showing that the accident did not happen when the deceased man was oiling the engine. Two main questions were raised. First, whether the accident arose out of and in the course of the employment, within section 1, subsection 1, of the Workmen's Compensation Act, 1897; and, secondly, whether the steam-engine was a "factory" within the meaning of section 7 of the Act. There was also a question whether the deceased man, in disobeying his masters' orders not to use the small door, was guilty of "serious and wilful misconduct," within section 1, subsection 1 (*c*), of the Act, so as to bar the claim for compensation. The County Court judge, in his judgment, said that the engine shed and the engine were a "factory" within section 7 of the Workmen's Compen- sation Act, 1897; that the deceased man had not been guilty of serious and wilful misconduct; and upon the question whether the accident arose out of and in the course of the employment, he said that in the circumstances it was probable that the deceased man was trying to creep under the shaft and was caught by it while doing so; that his duty after he had started the engine was to

go out of the front door to the mortar-pan, and that this would not have required him to go near the shaft; that the deceased was probably "in the course of" his employment when the accident happened, but that the appellant must go further and prove that the accident arose "out of" the employment, "Smith *v.* Lancashire and Yorkshire Railway Company" (1899, 1 Q.B., 141); and that the evidence showed that the ordinary course of duty of the deceased would not have taken him near the shaft, and that no evidence showed what induced him to go near the shaft; that it might have been some object of his own, or it might have been his intention to go out of the small door, which he was forbidden to do, and which his employment in no way necessitated; it was true that it might have been something connected with the engine which his duty required him to perform, in which case the accident would have arisen out of the employment; but in his opinion it was left absolutely uncertain whether it did or did not arise out of the employment, the balance of probabilities being rather that it did not; and as the burden of proof was on the appellant, he held that she had failed to prove that the accident arose out of the employment, and he therefore gave judgment for the respondents. The appellant appealed. By section 1, subsection 1, of the Workmen's Compensation Act, 1897, "if in any employment to which this Act applies personal injury by accident arising out of and in the course of the employment is caused to a workman," his employer shall be liable to pay compensation. By subsection 2 (*c*), "if it is proved that the injury to a workman is attributable to the serious and wilful misconduct of that workman, any claim to compensation in respect of that injury shall be disallowed." By section 7, subsection 1, "This Act shall apply only to employment . . . on or in or about a railway, factory," &c. By subsection 2 "factory" has the same meaning as in the Factory and Workshop Acts, 1878 to 1891, and also includes any dock, wharf, quay, warehouse, machinery or plant to which any provision of the Factory Acts is applied by the Factory and Workshop Act, 1895. . . ." By section 23, subsection 1 of the Factory and Workshop Act, 1895, "The following provisions, namely, . . . (V.) The provisions of this Act with respect to the power to make orders as to dangerous machines shall have effect as if (*a*) every dock, wharf, quay and warehouse and, so far as relates to the process of loading or unloading therefrom or thereto, all machinery and plant used in that process; and (*b*) any premises on which machinery worked by steam, water or other mechanical power is temporarily used for the purpose of the construction of a building or any structural work in connection with a building w included in the word factory. . . ."

Mr. Macaskie and Mr. E. W. Perkins, for the appell contended that the accident arose out of and in the cours the employment. Even if the deceased man was attempti contrary to his orders, to pass under the shaft so as to go by the small door it would still be in the course of his empl ment, as it was his duty to go to the mortar-pan, and accident would have arisen out of the employment.

Mr. Ruegg, Q.C., and Mr. A. Powell, for the responde contended that the appellant had not shown that the accid arose out of and in the course of the employment. If deceased man was going out of the small door he was do what he was forbidden to do, and in such a case it could be said that the accident arose out of and in the course of employment. Everything was left in doubt, and the appell had not discharged the onus upon her. Secondly, this was an employment within the Act. It was not a "factory" wit the definition in section 7, subsection 2. It was admitted t this was not a factory within the Factory Acts, 1878 to 18 To make it a factory it must come within that part of definition "dock, wharf, quay, warehouse, machinery or pl to which any provision of the Factory Acts is applied by Factory and Workshop Act, 1895." These words referred section 23, subsection 1 (V.) (*a*), of the Factory and Works Act, 1895, where the words were repeated, and did not refe clause (V.) (*b*), which related to premises on which machin was. The material words in this case of the definition in s tion 7, subsection 2, of the Act of 1897 were "machinery plant," and section 23, subsection 1 (V.) (*b*), only applied "premises" on which no doubt machinery was used. Th temporary sheds used in connection with building operati were never intended to come within the definition of fact and so to be brought within the Act of 1897.

The court allowed the appeal.

Lord Justice A. L. Smith said that the first point taken that no evidence was given that the accident to the decea man arose out of and in the course of the employment. Wo not anyone say, upon the facts proved here, that the accid arose out of and in the course of the employment? The decea man started the engine on the morning in question, and minutes afterwards he was killed. The County Court ju said that it was consistent with the evidence that the decea man might have been going towards the small door for purpose of going out of the shed that way, which he

essly forbidden to do, and that therefore it was not proved the accident arose out of and in the course of the employ- it. That holding came to this, that if a workman went by a ng way from one point of his employment to another an ry happening to him while doing so would not rise out of in the course of his employment. The learned judge felt self hampered by the decision in "Smith v. Lancashire and kshire Railway Company" (1899, 1 Q.B., 141), a case ch also came upon appeal from him. In that case a et-collector, after he had finished collecting the tickets, ped on to the footboard of the train after it had started made a remark to some one, and was killed in ing off. The learned judge in that case found as a that "the deceased was not actually engaged in any act ervice at the time of the accident, and did not get on to footboard for any object of his employers, but for his own sure." In face of that finding this court held the accident not arise "out of" the employment. How on earth could court have held otherwise in the face of a finding of fact the deceased man got on the footboard solely for his own sure? In the present case, assuming everything against appellant, assuming that the deceased man was going out e engine shed by the small door, which he was forbidden o, and assuming that he acted rashly and negligently in g so, how could the court absolve the employers from lity in the absence of serious and wilful misconduct on the of the deceased, which the judge had negatived in this case n the ground that the accident did not arise out of and in course of his employment? In his lordship's opinion, ing the case most favourably to the respondents, the dent to the deceased arose out of and in the course of his loyment. Upon that point therefore he was unable to e with the decision of the County Court judge The next tion was an important one, namely, whether the employ- t of the deceased man came within the Act of 1897. Was employed on or in or about a "factory" within the ning of section 7, subsection 1? To get at the defini- of factory one must look at subsection 2 of that sec- "Factory" was to include, among other things, any hinery to which any provision of the Factory Acts was lied by the Factory and Workshop Act, 1895 Turning to ion 23 of the Factory and Workshop Act, 1895, it seemed him that the Legislature had by subsection 1, clause (V.) and (*b*) made certain things factories to which the provisions he Act with respect to the power to make orders as to dangerous machinery were to apply. Supposing the machinery specified in clause (*b*) was defective, would not justices have power to make orders with respect to it? In his opinion the machinery specified in clauses (*a*) and (*b*) were both brought within the definition of "factory" in section 7, subsection 2, of the Act of 1897. In his opinion the engine in the present case came within section 23, subsection 1 (V.) (*b*), inasmuch as it was worked by steam for the purpose of grinding mortar, and was temporarily used for the purpose of structural work in connection with a building. The engine therefore came within the definition of a factory in section 7, subsection 2, of the Workmen's Compensation Act, 1897. The judgment of the County Court Judge must therefore be reversed.

Lord Justice Collins was of the same opinion. The evidence showed that the man's duty was to fire the boiler, to start the engine, to oil it, possibly to open the small door to ventilate the shed, and to go out to the mortar-pan. The evidence was that on the morning in question he started the engine, and in two minutes he was found involved in the machinery. The question was whether those facts amounted to evidence that the accident arose out of and in the course of his employment. His Lordship agreed that the onus of proving that lay upon the appellant. It came to this, Was there evidence to go to a jury that the accident arose out of and in the course of his employment, because the County Court judge did not decide upon the evidence, but said in effect that there was no evidence fit for the consideration of a jury? The highest that the case could be put against the deceased man was that he was killed while attempting to go out of the engine-shed by a dangerous way under the shaft, which he was told not to do. But it was just as much part of his duty to get out of the engine-shed as to go into it, and it was in the course of his employment to do either. The Workmen's Compensation Act, 1897, did not make negligence in the employer a condition of recovering compensation. It was not necessary to prove negligence in the employer, and it was no answer to a claim for compensation to prove negligence on the part of the claimant. If the claimant showed that the accident arose out of and in the course of the employment within the Act, then the employer, in order to escape liability to pay compensation, must show that the injury was attributable to the serious and wilful misconduct of the workman. The consideration of mere negligence, therefore, was out of place, and it was sufficient if the claimant could show that the accident arose out of and in the course of the employment, though the workman might have been negligent at the

time. Very probably there might be such a negligent act on the part of the workman so entirely outside his employment as would make the negligent act causing the injury not within the course of his employment at all. But here the accident arose out of and in the course of the employment, and if there was any negligence at all, it occurred in the course of the employment. There remained the second question. Section 7, subsection 1, enacted that the Act should extend to employment on or in or about a "factory." It was contended that this was not a factory within the meaning of the Act. That compelled the court to examine what he must call this extraordinary mode of legislation upon the point. A factory was defined by reference to the Factory Acts, 1878 to 1891—it was admitted that this case did not come within those Acts,—and it was further defined as including any dock, wharf, quay, warehouse, machinery or plant to which any provision of the Factory Acts was applied by the Factory and Workshop Act, 1895. That obliged him to refer to section 23 of the Act of 1895. That section applied a number of provisions in the Factory Acts as to dangerous machines to certain subject matters therein specified. The principle of the section was that it constituted certain things a "factory;" by subsection 1, clause (V.) (*a*), it constituted certain things, including machinery and plant used in certain processes, a factory; and by clause (V.) (*b*) it constituted something else, which was not machinery alone, a factory, namely, premises on which machinery worked by steam, water or other mechanical power was temporarily used for the purpose of the construction of a building or any structural work in connection with a building. It was said that clause (*b*) did not constitute the machinery a factory. But the legislation was for the purpose of enabling the authorities to make provision as to dangerous machinery, and on looking at it it was addressed to dangerous machinery in a factory. That explained why one must first get the factory. Turning back to section 7, subsection 2, of the Workmen's Compensation Act, 1897, one found that the word "factory" included machinery to which any provision of the Factory Acts was applied by the Factory and Workshop Act, 1895. In the Act of 1895 one found that premises on which certain machinery was was made a factory, and to that machinery the provisions of the Act was to be applied. Therefore, the machinery became a factory within the meaning of the Workmen's Compensation Act, 1897, and so there was a factory within a factory. By this indirect legislation there was this machinery in a factory, which machinery was itself a factory. The machinery, therefore, in this case became a factory, and the deceased man was employed on or in or about a factory at the time when he met his death.

Lord Justice Romer delivered judgment to the same effect.

Lord Justice A. L. Smith asked whether the case must go back to the County Court judge.

Mr. Perkins stated that the compensation had been agreed at 180*l.* 1*s.* 11*d.*

The Court gave judgment for the appellant for this amount, the County Court judge to apportion it between the widow and the children; the appellant to have the costs in the county court and on the appeal.

Mr. Ruegg, Q.C., applied for a stay of execution pending an appeal to the House of Lords, if such an appeal were decided upon, as the decision involved consequences of serious importance to the building trade.

The Court refused to stay execution.

THE WEEK.

E London County Councillors are not the advisers ractical man would care to consult about the training of kmen. The Council's staff of selected men are not ch esteemed, and it is only with one class of contracts y are likely to be satisfied. Regardless of prejudice, ch in this case is well founded, a special sub-committee the Council have been inquiring into the educational uirements of members of the building trades. Several nesses were heard, and a large report has been issued. e conclusions adopted are as follows:—1. That every rt be made to lengthen, with Parliamentary sanction, present term of school life, including a raising the legal age for leaving school, and that between teen and fifteen opportunity should be afforded special instruction in manual training and drawing. That no restriction whatever should be placed upon the ons attending theoretical classes in technical subjects rt from the general requirements that the members of class should be capable of profiting by the instruction ded. 3. That, with a view to enabling artisans to me qualified as general foremen, mechanics belonging ny branch of the building trades be permitted to attend the theoretical and practical classes in other branches he building trades. 4. That learners under 19 years of and improvers should be permitted to attend practical es, provided that they show sufficient familiarity with rade to render their efficient training possible without e interference with the progress of the class. 5. That committees should be appointed to visit and report the classes in each trade, and discharge the other s indicated in the report. 6. That in the teaching of urely trade classes (evening) and in the examinations ected with them, more stress should be laid on ods which secure mechanical skill and quickness of manship, as well as on theoretical knowledge, and nts should not be encouraged to expend an undue nt of time and labour upon elaborate models of no ical use. 7. That, as far as possible, the teachers ld be actually engaged in the trade in which instruction en by them. In order to secure this, special classes ld be instituted to qualify competent mechanics to be ers, and for this purpose the polytechnics should be as centres of normal training. The last is the most rtant recommendation, for it is a departure from the e usually followed in technical education in this try.

HANTILLY to-day presents a very different appearance t it which Dr. JOHNSON saw when he visited the Château e CONDÉS in 1775. Now it is one of the lordliest re-houses of Europe. Then it was more of a gerie than a palace dedicated to art. All that struck JOHNSON were the remains of animals. "What I mber," he said, "were the jaws of a hippopotamus rved, which, however, is so small that I doubt its y. Nothing was in spirits, all was dry." The simplest rt would now receive a different impression from the f the Duc D'AUMALE to France, and consequently are more English visitors and others than were ted in Dr. JOHNSON'S days. So many attend that in to facilitate entrances and exits it has been decided en two gates to the park instead of one. Other ements are adopted which will enable visitors to ne the collections with more ease than was possible ar. Chantilly will be reopened on Saturday, April 1, se who wish to pay an entrance fee in order to study rks of art unimpeded by a crowd, and on April 16 e public, who can enter without charge on Sundays hursdays during the season.

ARCHITECTS must have been glad when they saw the of Mr. BUTTERFIELD attached to the memorial g to Vauxhall Bridge, for it proved that the venerable was still anxious to see art applied to construction—iple he represented so well. It has become necessary for Mr. BUTTERFIELD to come again before the public about another subject. Ritualists are charged with the introduction of the arrangement by which there is a separation of sexes in churches. St. Alban's Church, Holborn, and All Saints', Margaret Street, were assumed to be evidence. Mr. BUTTERFIELD, as our readers are aware, was the architect of both buildings. In a letter to the *St. James's Gazette*, he says that for the former building he suggested to Mr. HUBBARD, who was paying for the work, that he should arrange with any clergyman to whom he might offer the incumbency that the division of sexes should be adopted there, as being the most certain way of ensuring that it should be a free and unappropriated church. Ritualism had not then asserted itself, and Mr. HUBBARD had no leanings in that direction. At All Saints'—the work of Mr. HENRY TRITTON and Mr. BERESFORD HOPE—it was settled from the first moment by the two founders that there must be a separation of sexes, for the same reason which afterwards influenced Mr. HUBBARD at St. Alban's. So-called Ritualism had nothing to do with it. We suppose, however, in spite of Mr. BUTTERFIELD'S assumption of responsibility, it will continue to be believed that the separation was a clerical innovation rather than an arrangement which was rendered necessary to secure unappropriated sittings.

ONE of the deficiencies of the National Gallery is the fewness of the works which are representative of French art produced during the century. An opportunity lately presented itself which would allow of one most characteristic work being added to the collection. The Princess DE SAGAN possessed the *Odalisque Couchée*, by INGRES, a painting that was popularised by engravings. Like so many of the master's works, it was a nudity, but it displayed his splendid draughtsmanship, which has become proverbial. The trustees were divided in opinion about its fitness for a public gallery in London, and by a majority of one it was decided to decline the offer to purchase the work. The picture was immediately secured for the Louvre, in order to prevent the possibility of a foreign government obtaining it. In an age of impressionists, INGRES' careful work is ridiculed because it is a satire on hasty production. But the opinion in which it is held by the conservators of the Louvre is indicated when we find one of the most admired of French works, LEOPOLD ROBERTS'S *Italian Harvesters*, has been removed to make room for the *Odalisque*. As a corrective of careless work the picture would be most useful in Trafalgar Square.

ONE of the consequences which are sure to arise wherever a majority of the so-called "working men" will be found in a public body was indicated by a motion which came before the Dublin Municipal Council last week. It was proposed that henceforth meetings of the Council and committees should be held not earlier than seven o'clock in the evening, except in the few cases where the hour is governed by Act of Parliament, so as to give the labour representatives an opportunity of carrying out the duties entrusted to them by the electors. What the change in the hours of meeting to accommodate the representatives of labour would entail was explained in a statement signed by the borough engineer, the city architect and other officials. The Council's offices must continue to be kept open during the day, and those having charge of them could not escape attendance, although they would be required for the nightly meetings. The latter would be as numerous as they are now in the daytime. It appears that in 1896 there were 760 committee meetings, in 1897 there were 822, and in 1898 647—an average of 743 meetings yearly, equivalent to two meetings every evening, Sundays and holidays included. To require officials to attend an equal number of meetings after seven P.M. would be to ask them to work for periods which no body of employés would willingly undertake, and no employers, on careful reflection, would think it expedient to demand. The labour representatives have not yet supreme power in the Dublin Municipal Council, and it was therefore agreed to delay action by submitting the question to a committee of the whole house. The officials of local authorities are hereafter not likely to wish for "working men" to become their masters.

SIR DOUGLAS GALTON.

THE Royal Engineers would be justified in adopting as one of their mottoes, "Peace hath its victories no less than war," for on the rolls of the officers many names appear of men who have been as useful to the State in civil capacities as those who have won a reputation on the field. It requires some self-denial and a strong sense of duty to take the side of peace. If, as Dr. JOHNSON said, "Every man thinks meanly of himself for not having been a soldier," then a soldier who is unable to take part in the operations of war must suffer more. But there have to be victims in all professions, and military engineers cannot hope to be exempt from supplying them. The late Sir DOUGLAS GALTON, who died on Friday last, was one of those men who might have aspired to high rank as a soldier, but although he rendered loyal service to the army from time to time his whole professional career during half a century was a civilian's. From his position as a Royal Engineer he was more trusted by the Government than if he were an ordinary civilian, but all his work could have been done by a civil engineer or a civil architect. About his ability there could be no question, for he was only eighteen when he gained his commission. That was in 1840. England had not then even a little war on hands, and GALTON was obliged to go through the usual routine of the corps, in which construction in various forms is an element. It is an advantage for a young sapper that he can endeavour to distinguish himself in the eyes of superiors without incurring the charge of trying to supplant his fellows. With the engineers contingencies are always occurring; demands are sometimes made by officials for men who are equal to undertake novel services, and sooner or later there is scope for ability which at first sight would not appear to be soldierly. DOUGLAS GALTON found such a chance when he was twenty-five.

Railways were then projected in numbers that excited some alarm among those who were supposed to be responsible for the lives of the people. If there were only cuttings and embankments necessary, with bridges consisting of stone or brick alone, the risks would be of little account. But roads and rivers and valleys were to be crossed, where a bridge of masonry or brickwork would be of no use. It was proposed to substitute iron, but where was the guarantee that every engineer who put his name on parliamentary plans was acquainted with the properties of iron? The examination of witnesses before committees made it plain that there was little agreement among engineers about the degree of strength which was necessary to insure safety. It was also uncertain whether the jarring caused by the transit of trains was injurious to the bridges. There were many other problems to be investigated, and accordingly a Royal Commission was appointed to report on the application of iron to railway structures. It should be remembered that in those days when iron was mentioned cast-iron was understood. Captain GALTON was appointed secretary to the Commission. As the most efficient member was Professor WILLIS, of Cambridge, it is needless to say elaborate calculations had to be undertaken, and the array of figures which expressed the results of the experiments was enough to appal an ordinary engineer. The report appeared in 1849, but by that time cast-iron for railway bridges was almost entirely superseded by wrought-iron. The investigation was creditable to all who took part in it, and the tables are occasionally referred to, but so much labour did not produce the advantages which were anticipated.

His experience as secretary was enough to make GALTON wearied with mathematical calculations and testing with delicate apparatus. He therefore accepted an appointment as one of the inspectors of railways under the Board of Trade. An inspectorship is a responsible but not a disagreeable office, and it does not mean hard work all the year round. In the course of three or four years GALTON was advanced to a position which allowed him less leisure, for he became secretary to the Railway Department. His patience endured the coiling of red tape for over five years, but in 1860 he resigned.

There was no leisure for a man of his calibre. He had proved by a dozen years discharge of various duties that he was trustworthy and versatile. Captain GALTON became the "general utility man" of applied science, but he wa no advocate of circumlocution or centralisation. From h experience he knew that Government officials were n more than mortal, and he was no advocate of handing ov to them business for which they did not possess specia aptitudes. Hence it was that he opposed many specialis who were advocating the purchase of railways by the Stat His attention was not confined to railways. At one tim he was employed on a commission for investigating th most favourable conditions for laying submarine telegrap cables, at another time he acted as referee on the projec for the disposal of the metropolitan sewage. He wa against the Barking outfall, and recommended another sp lower down; but if NAPIER'S scheme for utilising the sewa on the flat lands of Essex had met with financial suppo Barking Creek was as eligible a place for the transfer sewage to a different conduit as could be selected. A the scheme had to be abandoned, the main-draina system of the Metropolitan Board of Works for Nor London remains incomplete, and in consequence the Tham is polluted.

Sewage schemes served as an introduction of GALT to a new field of activity, that of sanitation, and thencefo he could be considered as waging war against an excessi death-rate. The losses which were caused in the Crim by the absence of provision for sheltering sick and wound men made people realise the relation between buildings a health. Evidence equally startling might have been fou in ordinary dwellings, but there could be no more impressi object lesson than was furnished by the ill-effects of barra and military hospitals. A commission was appointed inquire into the condition of the two classes of buildings home and in the Mediterranean stations. Captain GALT was a member. The report which followed was startli It was decided to set about the erection of hospitals o new type, and GALTON was asked to design the fi example—the hospital at Woolwich which bears the na of SYDNEY HERBERT, who was Secretary at War. As innovation it gave rise to much controversy, and at a la period the designer would probably have adopted differ arrangements, but considering the circumstances of time it must be considered as a courageous effort to dep from stereotyped plans.

The War Department still retained its hold on Cap GALTON. For a couple of years he rendered it efficient vice as Assistant Inspector-General of Fortifications. T he performed what was probably the most courageous of his life by accepting the post of Assistant Under-Secre for War. He was too anxious to have work done Pall Mall. He persevered for seven or eight years in hope of accomplishing reforms, but, like other brave m he was compelled to succumb to the clerks. After he left he was secured for the purpose of attempting reform the Office of Works. He was to look after construc while Mr. LAYARD was to foster good taste; but that turned out a forlorn hope. It is much to be regretted the tyranny shown to ALFRED STEVENS was exercised v Captain GALTON was in office, although we hope he not a voluntary agent in it.

The formation of the Sanitary Institute, which was in a great measure to an army doctor, enabled Ca GALTON to bring his large experience to the aid o general public in suggesting improvements in dwel His own suggestions were valuable, and his example support to other men who were labouring in the cause. He had no cut and dried rules. He insisted each building should have special treatment for wa and ventilation according to its position, design, uses, struction, &c. In that case he became the oppone empiricism, and helped to save the public that listen his advice from falling into the hands of the so- "practical man." He invented an excellent venti fireplace, which was sufficiently simple and efficie serve for use in barracks, but which could be employ rooms of all kinds. It was only natural he should b in its superiority, but he always endeavoured to rend strictest justice to the merits of its rivals. He continu be an earnest supporter of the Sanitary Institute his end.

That was not the only honorary work which h formed. Few men of our time rendered more faithfu

ces to the public in a quiet way. In Worcestershire, here he resided of late years, he was one of the most tive of public men, and he seemed to be quite content go through onerous duties with as little self-seeking as if were engaged as a subaltern in siege work. Although stiny kept him from the tented field, he always acted as if oved by the soldier's instinct, and in that way set an ample which it would be an advantage if many imitated. t the Great Review he must appear as a faithful rvant, who did the work entrusted to him with all his ight.

SYSTEMS OF DISTRIBUTING AND GENERATING ELECTRICITY.

By F. J. Warden-Stevens.

(*Concluded from page* 157.)

Transformers.

CLOSELY allied with dynamos are transformers, which have already been referred to several times.

A transformer is an apparatus for transforming or chang- electric current from one pressure to another without ring the total amount of energy. A transformer is ally used for changing pressures of 1,000 volts and vards, as used on high-pressure mains, to 100, 150 or volts, as used in consumers' premises. The current is reased in practically the same ratio as that in which the ssure is decreased.

An alternating current transformer consists essentially two coils of wire—one of many fine turns, and the other few thick turns, each quite independent of the other trically, but wound on one magnetic circuit, such as a inated iron core.

The principle of working is the same as in a dynamo. coil connected to the main generator magnetises alter- ly the iron, the magnetism of which passes through the from which the current is to be taken, and it will be that the action is just the same as if a magnet is moved nd out of this second coil, or passed in front of it as in lternator. A pressure is induced in the second coil h is proportional to the number of turns. Thus, with- any moving parts, but by adopting alternating current ad of continuous current magnets as used in alternators, pressure may be changed and current supplied, though ourse without motion the energy delivered cannot be ed.

A continuous current transformer is similar in principle, the exception that rotation is necessary. The two are wound as before described, but on the armature, h has two commutators. The one side receives the ent, the commutator transforms it into an alternating ent, which is transformed to the other coil, whence the ent is commuted into a continuous current by the other mutator. A small magnetic circuit is provided, just cient to cause the armature to rotate as a motor, but is its only use.

The voltage on the one side is a fixed proportion of on the other, and cannot be altered except by the tion of a small dynamo, the field of which can be d and which operates on one winding only. This gement is sometimes adopted, but is an additional lication.

Another form of continuous current transformer is a r coupled direct to a dynamo; the motor receiving the nt from the main generators and being direct coupled s the transformer dynamo running at a different ge. This latter method is not so efficient as the r, but it has the advantage that the voltage on the mo side can be varied independently of that on the r side without special apparatus.

Both the above classes of continuous current trans- rs may be used for converting continuous to alter- g current or *vice versâ*, by replacing one of the com- tors by two or more slip rings, from which the ating current is collected, as previously described.

Rotary transformers are also used for the purpose of sing the pressure on a circuit, which action is called sting." The motor side of the apparatus is connected across the mains as a shunt to the main current, which is carried through the dynamo side on its way to the trans- formed circuit. In passing through the dynamo its voltage is augmented by the voltage there generated. This is often arranged as a series machine, increasing the voltage with the current passing, which is the condition that has usually to be provided for, such as on a feeder supplying a distant portion of the network, where the pressure has to be higher than on the other feeders. Boosters are also used for charging accumulators from a constant-pressure circuit, the pressure having to be increased as the cells become fully charged. Alternating current transformers are often used as boosters, as already described, there being, of course, no moving parts.

A few words may here be said with reference to trans- former sub-stations. In large districts it is necessary to supply the distributing mains from several centres, in which case a transformer sub-station is necessary to contain the apparatus. These sub-stations are often constructed under the streets, but if possible the basements of houses are secured. The chief necessities are that the sub-station shall be waterproof and well ventilated. The great drawback to almost all forms of sub-stations is the "sweating" of walls when in contact with the ground, and this can only be prevented by isolating the chamber from direct contact with the ground, which can be done by means of non-con- ducting packing, air-ventilated bricks or bitumen. Asphalte lining for sub-stations is also frequently used, as it has a surface which does not deposit moisture. One of the best ways to effectually prevent the deposit of moisture is to ventilate the space thoroughly.

Switching Gear.—This is a most important part of the arrangement in electricity-supply works, and it requires very careful consideration, more than it perhaps sometimes receives.

It is requisite that a switchboard or switch panels, which contain measuring and regulating instruments and switch gear, should be in a prominent and accessible position, and it should be kept quite clear of all inflammable material. Safety from fire is one of the essential points consistent with good practice, and any switch panels should be designed with this as the primary object. Appearance is not a factor which should be studied when it necessitates a large quantity of woodwork. Some switch panels are now made with absolutely no inflammable material, all instru- ments being mounted on slate slabs fixed to an iron frame and all connections being of bare copper.

Switch panels may be made to combine safety with good appearance without the use of woodwork, and even if ordinary cables are used for connections it is impossible for a serious fire to occur. The walls, floors and ceilings within several feet of the switching arrangements should be fireproof, not only to prevent fire spreading to other parts of the building from the switch panels, but also to protect the switching arrangements themselves from the effect of fires in other parts of the building. Once the switch-gear is damaged a failure of the supply is almost inevitable, as it cannot very well be duplicated.

It is essential that switch panels should contain the following :—

For each dynamo—fuses, ammeter and switch, and perhaps shunt regulator.

For each feeder—fuse and ammeter.

For each battery of accumulators—fuse, automatic switch, ammeter and multi-contact switch for regulation.

For the whole arrangements—main and feeder voltmeters.

By means of these instruments everything that it is essential should be known can be easily ascertained, although there are many other less important points which it may be desirable to know. In works where the alternating current system is in use, it is necessary to have "synchronising" apparatus—that is an electrical device, as before mentioned, which shows when two alternators to be paralleled are in step. This apparatus consists usually of a transformer wound with three coils, one for each dynamo and the other for a pilot lamp. The coils are wound so that when the dynamos are in step, the two coils assist each other and the pilot lamp is bright. When the two dynamos are out of step the pressures are in opposite directions, and consequently the lamp does not light. The lamp is, of course, quite visible all over the engine-room,

and as a rule it is supplemented with a voltmeter of strong construction at the switching panels for greater accuracy.

The main voltmeter should possess a very open scale, and it should also be unaffected by temperature or stray magnetism.

Accumulators.—The use of accumulators in electricity supply works is extending rapidly. A few years ago many continuous current supply works were in operation without storage batteries, or only very small ones, and batteries were never adopted in alternating current works. Now large batteries are erected in every continuous current works, and small ones in most alternating current works.

The advantages of accumulators are chiefly the convenience of storage. A battery may be charged during the evening, taking the balance of the power of the dynamos not required by the lights, which will supply the demand from midnight until the next afternoon. This reduces the cost of attendance, the cost of coal, and the wear and tear of plant. The cost of a storage battery is, taking it to discharge in three hours at a given rate, about the same or rather less than that of a boiler, engine and dynamo to give the same power; and, this being the case, it is economy to adopt accumulators as a stand-by. Unlike running plant, it can always be drawn upon at a moment's notice in case of breakdown, and is independent of boilers or engines. There are a few disadvantages, such as rather high cost of maintenance and the necessity for skilled attention. Accumulators have a further advantage when used direct on the mains—they act as automatic regulators, especially where gas-engines are used. The battery absorbs any extra current which may be generated in excess of that required by the mains, and gives out any current required owing to less being generated than required, without altering the pressure perceptibly. The above of course only applies to continuous current supply.

In alternating current works the batteries are usually used in connection with the exciting circuits, and for the works, lights and pumps. This is economical, especially at time of light load, as no auxiliary machinery need be run, and the attendance and coal required may be kept down to a minimum. In some works the use of accumulators has gone even further. The light load itself is supplied from the accumulators by one of the continuous to alternating current transformers already mentioned, and the battery is charged in the evening by the same machine taking in the alternating current and supplying the continuous current to the battery. This has been found to remove one of the chief objections to the alternating current system, viz. the fact that the plant (engines and boilers) had to run uneconomically for sixteen out of the twenty-four hours.

It may be well to briefly describe the principles on which the accumulator works. The storage is not of electricity but of energy. The usual form of accumulator consists of two plates or sets of plates immersed in dilute acid; when the current is passed through the liquid the water in the acid is decomposed and oxygen is given off at one pole and hydrogen at the other. Usually the plates are essentially lead in a finely-divided form, and the oxygen oxidises one plate, but the hydrogen has no effect on the other unless it has become sulphated by contact with the acid, when it reduces the sulphate to pure spongy lead. In this state the accumulator acts as a primary battery and will give out current, the oxidised plate becoming reduced to lead sulphate and the spongy lead plate to sulphate. When both plates are again in the same condition the cell is discharged and must be recharged again by passing current into it.

Each cell has a pressure of two volts on discharge whatever its size, and so half as many cells must be provided as the pressure required, with a few to spare.

Buildings.—Very much might be said on the subject of buildings for electricity supply works, but it is certain the fact that the shape of the site, the type of machinery to be used and local conditions have a great effect upon the arrangements of buildings, and no one plan is applicable to all circumstances.

The requirements of the engineer should be laid before the architect, and the latter can then design a building to suit the means of the company or local authority. The chief points to consider are durability, ventilation, convenience and ease with which extensions can be carried out. It is a condition of economy in working a steam plant that the engines shall be as near to the boilers a possible, and that as extension becomes necessary th average distance shall not increase. It follows from thi that the most economical arrangement is to form th buildings so that the boilers are extended in the sam direction as the engines. The usual arrangement is t build the works in two parallel bays, the boilers being i one and the engines in the other. The offices are place at one end, usually near a road, and the other en is closed up temporarily. A wall separates the tw bays, and the steam pipes come through this wal When any extension takes place the bays are lengthene and when everything is finished and the new plant installe the temporary partition is removed to the new end of th works. By this means extensions can be carried out wit out interfering with the working of the plant, and witho allowing dust, grit, &c., to fall on the machinery. Th latter point is very important, as it is essential to kee running machinery free from grit, as otherwise hot bearin are liable to occur, and may be ruined, to say nothing the possible failures in the supply. The arrangement the buildings suggested here cannot be adopted universall as the shape of the site may be unfavourable; local circu stances must be considered. It is, of course, very necessa to have the building of such a shape that a travelling cra can easily be fitted, and the "bay" construction specia lends itself to the use of travelling cranes. It is importa that there shall be no pillars or other obstructions in t centre of the engine-room, as this prevents the travelli cranes from being used to advantage.

The walls of the building should have their foundatio independent of the engine foundations, and the foundatio should be, if possible, resting on different strata. If the precautions are attended to, the building will not suffer fr vibration. The floors of the engine-room should be form from the engine foundations as much as possible, and the should be ample allowance for pipe trenches, &c.

OPEN SPACES IN LONDON.*

IN his pleasant book about London, LEIGH HUNT rela his introduction to a child who had seen but one t a solitary example which grew in St. Paul's Churchy Whenever a tree was mentioned she thought it was that no other. LEIGH HUNT was describing the state of kn ledge on arboriculture among Londoners about fifty y ago. He considered their ignorance was wilful, for, as said, "There is scarcely a street in the City of Lon perhaps not one, nor many out of the pale of it, from s part of which the passenger may not discern a tree." there were many residents in the City besides his friend who had either failed to observe the branches leaves, or who had not travelled far enough to e the sight. There were in those days not trees, but flowers growing in London. HUNT ass his readers, as if it were something wonderful, a the existence of a real garden in Watling S which lay "completely open to the eye, being divided the footway by a railing only." HUNT was not ashame his cockneyism, although men like WILSON and LOCKH who were familiar with country scenes, were able to rid him for the extraordinary importance he attached to s and flowers and vegetation on a small scale. A man could say, "A flower put in a window in the streets great city affects the eye something in the same w the hand organs," was supposed to be inspired pettiness that was fatal to any claim to be consider poet. HUNT knew that men could be pent up in Lo until the love of nature gradually declined, and he tri suggest to them how that love could be recreated o served by the aid of reminders which the poorest were to afford. When he was imprisoned for two year saying that the Prince Regent was no longer youn beautiful, he covered the walls of his cell with room having a pattern of trellis-work and ivy leaves. I way he endeavoured to compel his imagination to per him that he was in Italy instead of in Horsemonger

* *The Municipal Parks, Gardens and Open Spaces of L their History and Associations.* By Lieut.-Col. J. J. Sexby. London: Elliot Stock.

What was remedial for himself he supposed was no less efficacious for others, and he advocated the bringing of nature within view of all, as a tranquilising agent that could make life more endurable. Hunt and the other representatives of the "Cockney School of Poetry" were despised by critics who were able to scale mountains and roam through woods, but the longings after something more than grimy streets have had beneficial results, and in spite of its growth and the increased value of sites, there are more green oases within the Metropolis than were to be found in the days when Hunt, Keats and Hood were compelled to describe nature out of their own consciousness.

It will hardly be credited that at present there are about 250 open spaces in which the Londoner can take his ease as if they were his own property. Some are small, being no more than disused churchyards, while others contain hundreds of acres. But they are all assigned to the service of the public, and they are as a rule conserved in a way that is satisfactory. It cannot be said that from the positions the character of the adjoining streets is always enhanced. The spaces had to be taken whenever the opportunity offered, and it would be useless to wish that occasionally they could be shifted to spots where more effect would be produced from their appearance.

The parks, gardens and open spaces are not as well known as they merit. It gave a shock to many people when they heard that Battersea Park had suddenly become a resort for fashionable cyclists. The choice was supposed to be as whimsical as the slumming explorations. It was not realised that the park is very different to the forsaken place which seemed adapted for amphibian animals alone when it was acquired in 1846. The "Fields" were so dreary the dangerous classes knew there was safety in them. A missionary, in describing some of the scenes which were common in Battersea, said, "If ever there was a place out of hell that surpassed Sodom and Gomorrah in ungodliness and abomination this was it." The prejudice which was then excited in the minds of respectable people is not yet entirely removed. But a visit to Battersea Park will reveal a victory that is comparable to the Northern Farmer's when he "stubb'd Thurnaby waäste"—the sub-tropical garden, the Alpine garden, the lakes, lawns, cricket grounds and other attractions make the park become a Garden of Eden for many of the inhabitants of the district. Victoria Park is supposed to be completely monopolised by "East Enders," and is too remote to attract Society for cycling or other novel diversion. It may not suggest the overcoming of so many physical difficulties as Battersea, but it would be hard to decide between their claims to attention. Near it is another open space called Meath Gardens, formed out of a speculative cemetery that was a failure. Most of the money for the purchase of the land from the owners was obtained by donation through the agency of the Metropolitan Gardens Association.

The liberality of rich people has been repeatedly exemplified in the acquisition of open spaces in the Metropolis. Sir Sydney Waterlow presented his estate on Highgate Hill containing 29 acres, with 6,000*l.* to purchase 2¾ acres that were held on lease. The park is, compared to others, what a small collection of cabinet specimens would be to a "general collection" of paintings. It has a piquancy which is peculiar. Another benefactor to the Metropolis was the late Sir Spencer Maryon Maryon-Wilson, who presented about twelve acres at Charlton. Baron Grant also purchased Leicester Square and made it over to the Metropolitan Board of Works, not in the condition he received it, but as we see it now, adorned with sculpture and laid out as a public garden. The gifts in land and money from individuals, however, acquired only a small fraction of the parks, gardens and open spaces belonging to the Metropolis. It was from the rates the greater part of the money was and will be derived. Both the Metropolitan Board of Works and the London County Council have often acted wrongly, but much may be condoned on account of the courage shown in the acquisition of lands for the general benefit. All divisions of the Metropolis now possess open spaces which rich and poor are able to enjoy.

The history of the transactions which have ended in the attainment of so large an area of public land is well deserving of narration. As the negotiations were mainly carried out by public bodies, the usual indifference to them has followed. The public can appreciate the results, and they are heedless about the procedure which had to be passed through. Colonel Sexby has therefore rendered a service to London by narrating how the parks and other open spaces were secured. From his practical acquaintance with a surveyor's business, he is in a position to understand all that was done, and he has spared no pains to prepare a record that will be accurate. But he is not satisfied with treating of finance. It happens that the most important acquisitions have an historical interest. The events, traditions and legends are described, and the volume is consequently well adapted for the general reader, while the archæologist will find in it information which would have to be sought through a large number of books. A glance at the index is sufficient to show how numerous are the associations connected with the open spaces.

The associations are so abundant and interesting, it is difficult to attempt a selection of them. Those of the Victoria Embankment Gardens alone would be sufficient, without wandering beyond them. Essex and Arundel Streets recall the ancient mansions which were the scenes of many historic events. In Arundel House the Royal Society found a local habitation. When it was proposed to remove the building the Society returned to Gresham College. Instead of a new mansion a street was laid out on the site, and the contrast between past and present inspired Gay to write some bitter lines on the innovations. Recalling the riches of the old house in Classic sculpture and paintings by Italian masters, he said :—

> Behold that narrow street which steep descends,
> Whose buildings to the slimy shore extends ;
> Here Arundel's fam'd structure rear'd its frame,
> The street alone retains the empty name :
> Where Titian's glowing paint the canvas warm'd,
> And Raphael's fair design with judgment charm'd,
> Now hangs the bellman's song, and pasted here
> The coloured prints of Overton appear.
> Where statues breath'd, the work of Phidias' hands,
> A wooden pump or lonely watchhouse stands.

Adelphi Terrace, which overlooks the gardens, was a speculation of the Brothers Adam. Garrick lived in the centre house during the seven last years of his life. There he surrounded himself with the fine things the leaving of which, as Johnson told him, would make a death-bed terrible. The riverside at Chelsea is associated with memories of Dante Rossetti, who lived in Cheyne Walk. Within a few doors is the house of Daniel Maclise, R.A., which was afterwards occupied by George Eliot for a few weeks before her death. Lincoln's Inn has a too-enduring memorial of Sir John Soane, for the appearance of it scares people from seeing its contents. Tennyson lived in an attic in the Fields, and Dickens was constantly visiting No. 58, where John Forster resided. But artists have avoided the place, although Inigo Jones has cast glory on it. In Red Lion Square Benjamin Robert Haydon, the painter, once lived, and Henry Mayer, who painted a portrait of Charles Lamb. Grose, the antiquary, possessed a house near Wandsworth Common. The name of Vanbrugh is inseparable from Blackheath. Sir Balthazar Gerbier, architect, painter, and probably spy, lived close to the Bethnal Green Gardens. Hogarth and Reynolds were inhabitants of Leicester Square. Many other memories linger about the gardens, and Colonel Sexby's volume will enable those who visit the open spaces to take a mental interest in them. Great care has been exercised in compiling the information. It is only in everyday matters which are common knowledge, such asnames of the architects for the School Board offices, that the author occasionally stumbles. In so comprehensive a work slips are to be forgiven. The pages are liberally illustrated with reproductions of old prints as well as of photographs. Altogether the volume deserves to be possessed by those who take an interest in the public gardens of London.

Mr. George E. Clare, M.S.A., who has been practising at 66 Duke Street, Chelmsford, has taken into partnership Mr. Walter G. Ross, and opened a London office at 1 West Street, Finsbury Circus, E.C.

LONDON TOPOGRAPHICAL SOCIETY.

THE annual meeting of this Society—the first of its reconstituted existence—was held on the 9th inst. in Clifford's Inn Hall. Lord Welby presided. The report of the organising committee stated that the origin and formation of that committee are recorded in the general report of the late Topographical Society presented with the handbook, which contained views and maps of London published by the former Society. The present organising committee, which includes several members of the Council of the old Society, have been administering the affairs of the new body, of whose aims and scope they have issued a prospectus. This document has been widely circulated among students, members of archæological societies and others likely to be interested, with the result that a considerable number of members have joined. The subscriptions received for 1898, added to the moneys taken over from the late Society, have enabled the committee to undertake publications in the first year of its existence, and to weld together the resources of the old and of the present societies. The existing stock of the publications brought out by the members of the old Society has not been allowed to suffer depreciation, and during the committee's administration subscriptions for these works have been received amounting to about 60*l.* Besides the handbook already referred to, the committee have issued the first series of an "Illustrated Topographical Record." One of the publications of the first year of the Society's existence is Porter's Map of London, *circa* 1660, which shows London as it was shortly before the Great Fire, and affords a glimpse of the London wherein Shakespeare dwelt, of which the original is in the possession of the Society of Antiquaries. Having in hand a series of drawings by Mr. Elmslie illustrating the changes in the topography of London during the existence of the old Society, the committee decided to bring out a second series of the "Illustrated Topographical Record." They had intended to bring out Norden's maps of London and Westminster, dated 1593, but felt constrained to make an alteration in their plans. As to proposed work, it is the committee's opinion that the reproduction of maps, views and plans of London should be their chief object, and for this purpose they recommended in particular a drawing of remarkable topographical interest acquired by the MS. Department of the British Museum. This is an elaborately detailed plan of the roads, &c., from Hyde Park Corner to Countess Bridge (what is now Addison Road railway bridge), in fifteen large sheets, made for the Kensington Turnpike Trust by their surveyor, Joseph Salway, and dated in Sloane Street in 1811. Of this the report contains an elaborate description, and recommends the issue of descriptive letterpress along with the maps, views and plans, on the lines of the handbook already brought out. If the "Illustrated Topographical Record" was to be combined, it would be a valuable piece of work for the Society to organise a complete photographic survey of London, both in the City and the county. The committee have a balance at the bank of 128*l.*, and received last year 224*l.*, including 76*l.* balance of last account.

Mr. Fairman Ordish, hon. sec., made a short statement. The draft rules, of which the most interesting to the general public was that which fixes the subscription at one guinea, were, with an amendment of detail, carried.

A motion was also carried regretting the inability of Mr. Henry. B. Wheatley to serve on the Council, and expressing the sense of the meeting of the great services which he had rendered to the cause.

The Chairman congratulated the Society on having secured Lord Rosebery as president. Elderly people were constantly reminded of the incessant changes being effected in London, and it would be a valuable work to keep memorials and drawings of London as it was from time to time. Sir George Scharf used frequently to take drawings of old buildings before they were demolished, and the preservation of such records and memorials tended to preserve the sense of continuity between the London of to-day and that of the past. It was to be hoped that the County Council would take an interest in the Society's labours, and it was satisfactory to have on the Council such men as Mr. Gomme, and the chairman and other members of that body. In the public offices were plans and records—one in particular, a plan of Whitehall of 1682—which were of great interest, and which enabled us to identify the actual site of the old Cockpit.

Sir Owen Roberts moved that the Council should put in hand a section or sections of the plans of the Kensington Turnpike Trust.

The motion was agreed to.

A motion was also carried in favour of the continuance of the "Illustrated Topographical Record," and interesting photographs taken from old drawings by Mr. Scannell of old London were exhibited.

Mr. Fairman Ordish, in moving a resolution in favour of the establishment of a Shakespeare memorial, by which the London of the poet's time might in its external aspects be realised, said that in the public offices there were many drawings of London between the dissolution of the monasteries and the Great Fire which would enable us to see London and its playhouses as Shakespeare saw them. A memorial volume of this kind might with advantage be published.

Mr. W. Poel seconded the resolution, and advocated the reproduction of Shakespeare's plays exactly as they were given in his day.

The motion, however, was lost.

ARCHITECTS' BENEVOLENT SOCIETY.

THE annual general meeting of the Architects' Benevolent Society was held on Wednesday the 8th inst. at the rooms of the Royal Institute of British Architects, Professor Aitchison, R.A., presiding. There was a good attendance of members, amongst those present being Mr. Macvicar Anderson, Mr. H. L. Florence, Mr. Sydney Smirke, Mr. E. B. l'Anson, Mr. Wm. Woodward, Mr. J. T. Christopher, Mr. Zeph. King, Mr. T. M. Rickman, Mr. W. Grellier, Mr. Henry Dawson, Mr. Arthur Crow, Mr. W. Hilton Nash (treasurer), and Mr. Percivall Currey (hon. secretary).

The minutes of the last meeting having been confirmed, the Treasurer announced that donations had been received from Mr. Macvicar Anderson of 18*s.* 10*s.* and from Mr. J. M. Brydon of 5*l.*

Mr. Percivall Currey then read the report of the Council as follows:—

The Council of the Architects' Benevolent Society, in presenting their forty-ninth annual report, have the pleasure of congratulating the members of the Society on a year of useful work, in which much has been done to relieve the necessities of deserving applicants, the sum of 654*l.* 14*s.* 10*d.* having been distributed among thirty-nine persons. They have also to report that there has been an increase in the amount received in subscriptions (471*l.* 10*s.* as against 459*l.* 13*s.* received in 1897), and that the following gentlemen have added their names to the list of annual subscribers:—Mr. Cecil Orr, Mr. E. Monson, Mr. H. Huntly-Gordon, Mr. Sydney Perks, Mr. H. Alexander Pelly, Mr. John Ford, Mr. W. G. Cooke, Mr. H. P. Monckton and Messrs. Patman & Fotheringham. While there has been this increase in the subscriptions, the Council regret that there has been a considerable falling-off in the amount received in donations, the sum of only 105*l.* 12*s.* having been received, as compared with 300*l.* 17*s.* 7*d.* received in 1897. Amongst the donations the following may be mentioned:—Colonel Edis 21*l.*, Mr. Aston Webb 15*l.* 15*s.*, Dr. R. Rowand Anderson 10*l.* 10*s.*, Mr. A. Hessell Tiltman 10*l.*, Mr. George Inskipp, Mr. Wm. Woodward, Mr. W. West Neve, Mr. J. T. Christopher and Mr. G. Elkington 5*l.* 5*s.* each. The Tylers' and Bricklayers' Company also gave 5*l.* 5*s.*, Messrs. Patman & Fotheringham 3*l.* 3*s.* and Mr. Sidney R. J. Smith 3*l.* Various smaller sums were also gratefully received.

The steady increase in the number of subscribers during the past few years (the amount being now more than 50 per cent. in advance of that received in 1892) is however an indication that a growing interest is being taken in the Society, and that the work which it performs in assisting unfortunate architects, their widows and children is becoming more widely recognised. Still, the Council feel that the number of subscribers (a little over 300) is small compared with the number of practising architects who are in a position to contribute to the Society's funds, and they would cordially invite inquiries from non-subscribers as to its scope and objects.

It has long been felt that the Society would be more generally supported if its existence were more widely known, and with a view to extending the knowledge of its aim and work, your Council have recently had under consideration the question of an annual dinner. It was thought, however, that this would be undesirable at the present time, and that the same object might be served if the fiftieth anniversary of the Society, which would occur in 1900, were celebrated by a dinner. A small sub-committee has therefore been formed to make the necessary arrangements for such an event, and your Council trust that the committee's efforts will be heartily supported by members of the Society and by the architectural profession at large.

The proposal carried at the annual general meeting last year to increase the number of the Society's pensioners from three to six, and the amount of the pensions from not less than 15*l.* to not less than 20*l.*, was confirmed by a subsequent general meeting specially convened for the purpose on July 13. The available pensions were therefore duly advertised at the beginning of the present year in the professional papers and the *Times*, and allotted to the most deserving candidates.

The Council have much regret in recording the death of three of the oldest members of the Society, Professor Hayter Lewis, Mr. J. J. Edmeston and Mr. T. C. Hine. Professor

ıyter Lewis, who has bequeathed 100*l.* to the Society, was e of its original members, and one of its most generous bene- tors. He served on the Council on many occasions and ted as honorary treasurer with advantage to the Society from 36 to 1889. Mr. Edmeston had been a subscriber since 1860 d had also served on the Council. Mr. T. C. Hine was an ginal member and acted as a corresponding member of the uncil from 1855 to 1870.

Seven meetings of the Council have been held during the ar, the average attendance at each meeting being eight.

The following gentlemen, being the five senior members, tire by rotation from the Council, namely, Mr. Arthur ow, Mr. E. A. Gruning, Mr. G. T. Hine, Mr. Arthur Cates d Mr. Aston Webb. To fill the vacancies caused by these tirements, the Council have the pleasure to nominate Sir thur W. Blomfield, Colonel R. W. Edis, Mr. Edwin T. Hall, r. T. M. Rickman and Mr. R. A. Briggs.

The Council, in closing their report, desire to express their nse of the indebtedness of the Society to the Royal Institute British Architects for office accommodation, &c., and to the ficers for their always helpful courtesy.

On the motion of Mr. Macvicar Anderson, seconded by Mr. ph. King, the Council for the ensuing year of office was ected as follows :—

Mr. Aston Webb, Mr. H. L. Florence, Mr. J. T. Christopher, r. Sydney Smirke, Mr. W. Grellier, Mr. E. W. Mountford, r. R. H. A. Roumieu, Mr. W. Woodward, Mr. E. B. I'Anson, r. E. H. Martineau, Sir A. W. Blomfield, Colonel R. W. Edis, r. E. T. Hall, Mr. T. M. Rickman and Mr. R. A. Briggs.

The honorary secretary and treasurer were thanked for their rvices, and re-elected in their respective offices.

The retiring auditors, Mr. C. Forster Hayward and Mr. G. ethbridge, having received a vote of thanks, Mr. Henry awson and Mr. Zeph. King were elected auditors for the nsuing year.

On the motion of Mr. Woodward, a cordial vote of thanks as passed to the Royal Institution of British Architects for ffice accommodation, &c.

The Chairman, in replying to a vote of thanks, made an loquent appeal on behalf of the Society, and urged its claims n the large body of practising architects who are not ranked mongst its subscribers.

THE ALFRED MEMORIAL.

IN a letter to the *Times* Mr. Lionel Cust, of the National Portrait Gallery, writes :—

At the meeting convened by the Lord Mayor of London to rther proposals for the national commemoration of King lfred the Great it did not seem proper to raise any discordant ote which might disturb the unanimity with which all present ere ready to welcome the scheme. The proposals, however, f the executive committee seem to invite some criticism.

It seems to have been resolved by the executive committee hat the national memorial shall be at Winchester, and consist f a statue of King Alfred, together with a hall to be used as a nuseum of early English history. Part, at all events, of this vork has already been put in hand.

It is a curious trait of committees appointed to consider ational memorials that they can seldom agree upon any ommon idea other than that of a statue. Hence arise such bsurdities as the accumulation of portrait-statues of statesmen ll within a few yards of each other at Westminster.

There is at present in this country a school of sculptors qual to any that have been produced at any time in any land. They only lack opportunity. When such a commission as the Alfred Memorial was given in the great days of Italian sculpture, the committee said to Donatello or Ghiberti, "Make us a beautiful monument, either a shrine or a group in marble, or hammer out in iron or bronze the great deeds, legendary or otherwise, of the hero whom we wish to make immortal." Donatello and his compeers did it and made their country, as well as themselves, the more famous thereby. Given a free hand in the design, our Thornycroft, Onslow Ford, Gilbert and their skilful brethren can and would do the same for England.

Again, a statue will presumably convey, or be intended to convey, a likeness of the great king and law-giver. As far as I know, no likeness of Alfred exists, for the Alfred Jewel at Oxford and an occasional coin can hardly be regarded as an authority. Perhaps the executive committee have already furnished Mr. Thornycroft with the necessary information.

With regard to the hall and museum, if the latter is seriously intended, it would seem a waste of money to build it until the committee were certain of having something to put into it. For antiquarian reasons also the proposal to insert this museum into the ruins of Wolvesey Castle may be considered questionable. It should be remembered also that monuments have already been erected to Alfred at his birthplace, Wantage, and that while Winchester, where Alfred died and was buried, is justly and laudably anxious to possess a visible memorial of its great citizen, such a monument at Winchester cannot dislodge those at Wantage from priority of conception and completion. Finally, from the national point of view, it is worth remembering that, though Alfred was born at Wantage and died at Winchester, it was Alfred who rescued London from the Danes and enabled London to become the metropolis of the Anglo-Saxon race.

There is time for the nation to think calmly over the proposals for this memorial, as the commemoration does not take place until 1901. While heartily in sympathy with the general scheme, I beg to offer these few criticisms for public consideration.

THE EXCAVATIONS IN THE FORUM.

AN offer has been made by Mr. Lionel Philips of 2,500*l.* for the purchase of the houses built on the site of the Basilica Æmilia. The object of the purchase of the buildings from their present owners (says the Rome correspondent of the *Morning Post*) is that they may be removed so as to facilitate the excavations in which so much interest is being taken at the present time. About a week ago Mr. St. Clair Baddeley, a member of the British-American Archæological Society, gave to some friends and acquaintances a lecture in the Forum on the subject of the Forum and the Basilica Æmilia, the first great extension of the Forum Romanum. After describing the triumph of the Romans over Perseus at Pydna and the magnificent Greek spoils then brought to Rome, he laid stress on the importance of the site now occupied by a number of third-rate houses under which lie parts of the Forum and the basilica which have never been explored. Mr. Baddeley mentioned that the cost of buying up the houses which cover this archæological mine would amount to the large sum of 64,000 lire, or 2,500*l.* After the lecture Mr. Lionel Philips, who was present, quietly said that the only way he could recompense the lecturer for the pleasure he had experienced in listening to so real and vivid a description of the triumphal return of the Romans laden with so many trophies of Greek sculpture and Greek art would be to contribute, if allowed, to the cost of expropriating the houses and carrying out the excavations. He therefore authorised the lecturer to announce to Signor Baccelli, the Minister of Public Instruction, his readiness to contribute 2,500*l.* to the undertaking, the money to be lodged at the Banca d'Italia, and to be utilised exclusively for buying up the houses, and excavating the sites, provided that the work were done with reasonable quick-ness. This offer was at once made to Signor Baccelli, who is said to be consulting his colleagues about the matter. It is also reported that the matter had been laid before King Humbert, who was delighted at this new proof of universal public spirit on the part of an Englishman. The site is extremely interesting, as it lies between the ancient Curia, or Senate House, and the Temple of Antoninus and Faustina. The Basilica Æmilia is mentioned by Pliny on account of its magnificence, as it was built of Phrygian marble. Some portions of the cornice have lately been unearthed near the site by Signor Giacomo Boni, who is now in charge of the excavations. The offer made by Mr. Lionel Philips has created the greatest enthusiasm among archæologists in Rome, and it is hoped that the Italian Government will hasten to take advantage of it and push on the work.

VAUXHALL BRIDGE.

AT the meeting of the London County Council on Tuesday, Dr. Longstaff asked whether the Institute of British Architects had been consulted as to the design of the new Vauxhall Bridge since the method of construction in concrete was adopted ; whether the committee desired the new bridge to be an ornament to London, and, if so, what steps they proposed to take to secure that end.

Mr. Ward (chairman of the bridges committee) said that the answer to the first question was in the affirmative. The committee of the Institute of British Architects had been seen three times on the subject of the original design of the bridge. The arches were then of steel, but as a result of these interviews the committee, on the advice of their engineer, arranged to build the arches of concrete faced with granite. Fresh drawings were made and a model was prepared in plaster on a large scale, and as the result of a further interview, Mr. Waterhouse wrote the letter he had referred to last week. After approving the design of the bridge, the letter made some further suggestions on minor matters, and some of these would no doubt be incorporated in the working drawings which were being made for the arches. The piers had been decided on some time ago, and the contract had been let. The architects seemed to differ greatly among themselves. He certainly hoped the new bridge would be an ornament to London. Even now the committee would be glad of any further suggestions or criticisms from the architects.

NOTES AND COMMENTS.

THE contest over the London Government Bill will soon commence. The County Council was a reform introduced by the party now in power, and they would be slow to undo their own work. But the operations of the works committee allowed no choice. The new London Government Bill is therefore a reproof to the Council, an intimation that unless more care is taken to prevent the loss of money on contracts a more revolutionary measure will be inevitable. We must admit it seems like a retrograde movement to go back to vestrydom, for the new boroughs are only vestries "writ large." But what is to be done when it is found that the class of men who meddle with municipal affairs in London cannot deal with anything on a grand scale unless it is the wasting of money? Care will have to be taken, however, to prevent the inhabitants of the Metropolis from being mulcted with increased expenditure by the creation of additional works committees on a smaller scale than the one holding revels in Spring Gardens. No less important will be the administration of the Building Act. The committee of the Privy Council are to be entrusted with authority to make a provisional order determining what powers under the Act of 1894 "are to be exercised by the London County Council and the borough councils respectively, and the conditions under which they are to be exercised." That clause deprives the County Council of some of its most important powers, and there would be much opposition to it if the Council's methods were satisfactory. The Privy Council will be as liable to misunderstand what is needed for the improvement of London streets as any elected body. But if the County Council can be made amenable to common sense by depriving it of some of its authority, so desirable a result is worth a little sacrifice on the part of architects. The borough authorities will be able to license wooden structures, to remove unauthorised sky-signs and obstructions in streets, to demolish dangerous buildings, to regulate the stacking of timber and the supply of water, to acquire land and provide for housing working-classes, &c. None of these changes suggest a lighter taxation, and there is the weak point of the Bill. It should embody more precautions against a continuance of the extravagance which has been rampant too long already.

THE Town Council of Harrogate invite architects to submit competitive designs for a new kursaal, and other additions to the existing buildings. The existing buildings are to remain as far as practicable, and the additional accommodation required is as follows, viz. :—Concert hall, to accommodate 3,000 persons; refreshment-room and café; billiard-room (three or four tables); cloak-rooms and lavatories for ladies and gentlemen, telephone call office, reading-room, smoke-room. In connection with the concert-room, a gallery should be provided in which smoking would be permitted; there should also be a verandah outside the concert hall, which should be so arranged as to be capable of being closed in during inclement weather. Lithographed copies of four sketch plans prepared by the borough surveyor will be furnished to each competitor, that marked No. 3 being the one which was viewed the most favourably by the committee; but it is to be distinctly understood that these sketches are merely intended to indicate the general lines on which the concert hall only should be planned, and are not to bind competitors in any way. If the existing pump-room (in which is situate the chloride of iron spring) should be disturbed, suitable provision must be provided elsewhere. No shops are to be provided in connection with the scheme. All the buildings are to be faced with stone. Competitors not complying strictly with the conditions will be disqualified. Each set of drawings to be sent in anonymously, but accompanied by the author's name and address on foolscap paper in a sealed envelope, foolscap size. All drawings are to be mounted on wood stretchers, size 48 inches by 34 inches over all, prepared for hanging, with cord and rings. Any competitor submitting alternative designs must send each set packed separately, with sealed envelope enclosed, and a separate report. The report descriptive of the drawings must state the cubical contents of the buildings and the price per foot at which the cost is estimated, as well as the total cost No models, photographs, or perspective drawings will be allowed. All drawings, except block plan, are to be to a scale of 8 feet to an inch, in black line only, the walls on plans and sections being blacked in, and no colour or washes of any kind are to be shown on the elevations. A lithographed plan showing the existing buildings and ground levels will be furnished to each competitor. The total cost of the scheme must not exceed 20,000*l*. All plans to be sent in, addressed to SAMUEL STEAD, borough surveyor, not later than June 3, 1899.

THE Americans have discovered a new use for electricity, viz. thawing frozen waterpipes. In the town of Maddison 400 mains were blocked, and recourse was made to the professors at the local university, where it was arranged that a current could heat the pipe and thaw it without any risk of bursting. Experiments were at once made, and in a short time the pipes were freed from ice. Mr. ADAMS, the president of the university, has been compelled to issue the following bulletin in order to be spared correspondence from all parts of the States from which applications for information had been received:—"The source of electric power which is required in thawing service pipes should be capable of producing 300 amperes of electric current, with a pressure of from 50 to 60 volts. This power may be obtained by means of an alternating current transformer connected with electric light lines or any other similar source. Whenever several pipes in a city are frozen we advise that the water-works and electric-light companies be asked to join in the effort to facilitate the work of thawing. Although up to the present time experience has been chiefly confined to service pipes, the method is applicable to street mains in case sufficient power is obtainable. It has been computed that 75 horse-power is requisite to thaw out within thirty minutes a frozen main 6 inches in diameter for a distance of 100 feet. For a longer distance corresponding power would be required. It is ordinarily found that the time needed for thawing any length of pipe less than 200 feet does not exceed half an hour after the electricity is applied.' In other places the experiment was no less successful.

PERSIA was at one time the rose garden where poets were appreciated like nightingales. Those happy days have passed. But art, which was only a species of poetry, has survived, in spite of all the evils of monarchs. Modern Persian work retains some of the old beauty, which is in a great measure due to the moderation of the designers, who appear always to appeal to minds that love what is refined and have a distaste for glaring effects. It is strange that while there are so many reproductions of Persian patterns in free libraries and museums throughout the country, English manufacturers should imagine that what is glaring and barbaric will find a market among the people. In speaking lately at the Society of Arts Mrs. BISHOP, the traveller, said that wherever she went in Persia she found Russian goods, and "was told that the Russian merchants understood their taste better as to colours and patterns; the Manchester prints were large fiery patterns, with a great deal of scarlet in them, which were probably intended to suit the supposed barbaric taste of Persians, whilst the Russian prints were in smaller and quieter patterns and more subdued colours, which the Persian women wore with pleasure, because they gratified their refined taste. To send staring patterns to Persia, where good taste is proverbial, is the most absurd thing possible." The Manchester manufacturers would, we suppose, say their designers were taught in the schools of the Science and Art Department, and were realising the true principles of form and colour.

CATHEDRAL SERIES.—DURHAM: CHOIR, LOOKING EAST. CHOIR VAULTING, LOOKING WEST.

WEIGH HOUSE CHAPEL, DUKE STREET, GROSVENOR SQUARE, W.

PRIVATE BALL-ROOM, THE HAGUE.

SOME GOTHIC CATHEDRALS.*

(Concluded from last week.)

ANOTHER and much later, but equally sumptuous example of the manner in which buildings of the Perpendicular och were fitted, confronted them in the choir of King's llege Chapel, Cambridge.

When the works of this *cantio cygni* were commenced in 40, Mediæval art in Southern Europe was beginning to feel e influence of the Italian Renaissance. The building was ll in progress when the Perpendicular style gave way before e new impulse, so that this "glorious work of fine intelli- nce," almost the last great triumph of English Gothic, became eceptacle not only for that sumptuous organ screen, and for se matchless stalls, but for its series of unrivalled painted ndows—unrivalled, that is to say, for their age and style. esigned and built for one form of worship, this glorious ecimen of English fifteenth-century Gothic was unfurnished ien another was introduced, but by some lucky chance it had ntrived to elude both the spoliation of the Great Rebellion d the vitiated taste of the last century.

They would remember how Wordsworth, in one of his nnets, speaks of the marvellous fan-traceried roof of King's llege Chapel—

> Self-poised and scooped into ten thousand cells
> Where light and shade repose, where music dwells.

ie effect of this chapel, lighted up on the Saturday and nday afternoons of winter with an apparently endless line of ndles, was a sight once seen never to be forgotten.

Another highly interesting Cambridge college chapel was at of Trinity, a view of which was shown. The gift of Queen ary, it was an oblong, flat-roofed, debased Perpendicular ucture. When the chapel of St. John's College was being uilt, some, fired by its example, advocated the rebuilding of at of Trinity. Luckily, the lecturer observed, wiser counsels evailed, for the chapel—certainly not the monument of a od age—is so thoroughly identified with the history of the llege, has so very dignified an interior—remodelled some irty years ago by the plastic hand of Sir Arthur Blomfield, oliday contributing some singularly beautiful painted glass—at to have removed it would have been to tear out one of the ost interesting pages from the architectural history of ngland.

With a view of the interior of Henry VII.'s Chapel, West- nster, Mr. Bumpus concluded his series of Perpendicular ecimens, remarking that many persons thought English chitecture came to a close with the reign of that monarch; lt this was a mistake. To be sure, our church architecture gan to lose some of its purity towards the close of the Wars the Roses—when the cathedrals, abbeys and churches, on which the hand of the spoiler had not yet been laid, must ve presented a most magnificent spectacle; but the em- llishment of, and additions to, religious edifices were carried with unabated vigour till the Dissolution of the Monasteries, en Pointed architecture received a check from which it has ly recovered within the last sixty years. Pointed forms, how- er, lingered on down to the middle of the seventeenth century, evidenced not only in a number of churches scattered up and wn the country, but in several college chapels in Oxford and mbridge, though much mixed up with Classical detail.

In France they had no Perpendicular style, their Flowing corated degenerating very soon into poor Flamboyant, and en losing itself altogether in the Renaissance of the Classical. s specimens of two Flamboyant façades of the better class, ose of the cathedral at Tours and the church of St. Jacques Dieppe were shown.

The lecturer remarked that he could not take leave of this eculiarly English phase of Gothic—the Perpendicular—without rsory allusion to such buildings he had not shown them as dington Church, Wiltshire, an interesting example of the ransition from the Decorated; the choir of Gloucester Cathedral; e presbytery of Winchester Cathedral; the chapels of New ollege, Oxford, Winchester and Eton; St. George's Chapel, Vindsor; Sherborne Minster; Manchester Cathedral; St. lary's, Nottingham; the Beauchamp Chapel in St. Mary's, Varwick; the chapels of Bishops Alcock and West ter- inating the choir aisles of Ely Cathedral, and the glorious erpendicular churches with which Somersetshire, Norfolk nd Suffolk are studded. The roofs, screens and bench nds of these Perpendicular churches were very splendid, nd if his hearers wished to know the manner in which e two former, in such East Anglian examples as Blyth- urgh, Cawstone, Filby, Irstead, Knapton, Southwold, Trunch, Westhall and Worstead were coloured, they had but to pay a sit to the South Kensington Museum, where, in the small om opening out of the gallery containing Raphael's cartoons, they would find some admirable pieces of work in illustration of this particular branch of fourteenth and fifteenth-century decorative art from the pencils of Messrs. G. Wardle and W. T. Cleobury.

The magnificent cloisters attached to Gloucester Cathedral must not be forgotten. Cloisters, remarked the lecturer, were to be seen nowhere in Europe on such a dignified scale as in England. It was, perhaps, in cathedrals which were both the seats of bishops and great monastic establishments that these beautiful appendages to a Gothic building could be seen in their grandest form, as, for instance, Canterbury, Durham, Norwich and Worcester. Several churches, at once cathedral and monastic, as *e.g.* Ely and Winchester, had lost their cloisters, which were of great extent. Gloucester, Chester and Oxford, cathedrals of the new foundation, retained these append- ages very completely, especially the first named. At Peter- borough the cloisters, which were not only of vast extent, but equipped with painted glass, some of which yet survived in the windows of the apse, were completely destroyed at the Rebellion. Some cathedrals of the old foundation—Lich- field, York, St. David's and those of the three other Welsh sees, Bangor, Llandaff and St. Asaph—were unsup- plied with these entourages; while others — Chichester, Hereford, Lincoln, Salisbury and Wells—possessed cloisters of singular beauty and magnificence, though it is difficult to assign any cause for their erection beyond the supposition that they were either mere *objets de luxe*, or formed a covered way from the cathedral to the chapter-house and the resi- dences of the bishop and dignitaries.

Mention was made just now of cathedrals of the old foun- dation. By this was meant those whose chapters, consisting not of monks but of secular canons, were not disturbed in the reign of Henry VIII., when all monastic establishments were either swept away or remodelled with chapters of secular canons. The cathedrals of the old foundation are Bangor, Chichester, St. David's, Exeter, Hereford, Lichfield, Lincoln, Llandaff, London, Salisbury, St. Asaph, Wells and York.

The remaining cathedrals, which, having been served by monks, were refounded with secular canons in the time of Henry VIII., and abbey churches then made cathedrals for the first time, are called cathedrals of the new foundation, and include Bristol, Canterbury, Carlisle, Chester, Durham, Ely, Gloucester, Oxford, Peterborough, Rochester, Winchester and Worcester.

The sees of Liverpool, Manchester, Newcastle, Ripon, Southwell, St. Albans, Truro and Wakefield were creations of modern times, and that of Bristol, having since 1830 been united with Gloucester, was in 1897 once more severed from it and reconstituted a separate diocese.

France had been singularly unfortunate in the preservation of her cloisters; indeed, considering the atrocities committed upon her fanes at the close of the last century, when such magnificent structures as St. Nicasius at Rheims, the cathedral at Dijon, and St. Jean des Vignes at Soissons were razed to the ground, the wonder is that so many have come down to us in the condition they have.

In Germany the number of churches retaining their cloisters was perhaps larger than England, but although many were interesting as belonging to the Romanesque and Transitional periods of Gothic art, the lecturer opined that in point of finish and refinement they could not rival our own. Interesting specimens of early cloisters existed attached to the minsters at Essen and Bonn, to the Busdorf Kirche at Paderborn and to the cathedral at Hildesheim. Sometimes the cloisters of German churches occupied very odd positions, as for instance at Hildesheim and Ratisbon cathedrals, where they were placed at the extreme east end, and at Paderborn Cathedral, where they would be found east of the transept. These cloisters at Paderborn were singularly fine specimens of German com- plete Gothic work, as were those attached to Münster, Magde- burg and Mayence cathedrals. Very beautiful, too, were those of the same age belonging to the collegiate church at Xanten St. John's Church, Osnabrück, and St. Stephen's Mayence.

Returning to England, and taking up the thread of its architectural history, Mr. Bumpus observed that the Great Fire of London swept away nearly all her Mediæval churches. To replace them we had that wonderful group by Sir Christopher Wren, whose design for each varies according to the shape of the site occupied by its predecessor. Often this site was very irregular, but the ingenuity of Wren overcame all obstacles, and in each church we had some architectural conception, grandiose in its effect, utilising to the best the old site, and containing among its *instrumenta* an altar-piece, a pulpit, a door-case, a font cover, an organ, a chandelier such as would afford a perennial source of study and delight.

Although the subject of his lecture had been "Gothic Cathedrals," the lecturer observed that he was unable to resist calling the attention of his hearers to these unique works, all grouped around St. Paul's, which although the noblest building built in Europe in the Italianised Grecian style, was in reality a Gothic body in a Classical dress.

* A lecture delivered on Thursday evening, March 2, by Mr. . Francis Bumpus, before the Guild for Young Men and Women tached to New College, N.W.

In some of his City churches Wren was constrained to adopt Pointed architecture, but albeit the proportions of his churches in the Gothic style were faultless—as, for instance, the towers of St. Michael's, Cornhill, and St. Alban's, Wood Street—they would not bear a minute inspection. The period subsequent to the Great Fire was one of Classicism. The beautiful symbolism of Wren, Hawksmoor, Flitcroft and Gibbs, which characterised the last quarter of the seventeenth and the first of the eighteenth century, was succeeded by the unmeaning ugliness of the reign of George III., when everything relating to ecclesiastical art was at its bathos. Yet the latter portion of this dreary period, the 'teens of the present century, witnessed the publication of some of the most sumptuous works ever produced on the architecture of England, as, for instance, Britton's "Cathedrals" and "Antiquities of England," "The Beauties of England and Wales," Pugin and Le Keux's "Antiquities of Normandy," Wild's "Cathedrals of Lincoln and Worcester," and Sir Henry Ellis's edition, with Coney's etchings, of Dugdale's "Monasticon." Then there was the "Gentleman's Magazine," which was, so to speak, the "Art Journal," the "Athenæum" and the "Architect" rolled into one, and later the "Penny" and "Saturday Magazines," both of which placed much useful knowledge on architecture and antiquities within the reach of those by whom the costlier works were unattainable. Of course, in all these much was written on the subject of Gothic architecture, and endless theories were propounded about its origin and development, but it was left for writers of another decade to reduce the result of these researches to a systematic and compendious form, and to provide what was a want most keenly felt by the architectural student—a grammar of his art. Mr. Bumpus, however, opined that the English never lost their love for old Gothic art even during this the darkest and coldest chapter of ecclesiastical history, peeping forth as it did in the erection of such absurdities as Strawberry Hill and the chapel in Tavistock Place. But the subject of the revival of the true principles of ecclesiastical art formed a history in itself, and one of which he dared not even touch the fringe that evening. As, however, the subject of his lecture had been "Gothic Cathedrals," he could not bid farewell without throwing on the sheet views of the three great cathedrals built during the last thirty years in the British Isles —those of Truro, Edinburgh and Cork, each of which had been carried out by a distinguished architect in his style of predilection. Of Truro Cathedral, the work of the late Mr. J. L. Pearson, conceived in that peculiar type of Early English familiarised to them by his London churches of St. John, Red Lion Square, and St. Augustine, Kilburn, the choir and transepts had as yet reached completion, and these had been really and truly completed in the most sumptuous and finished style. This was the way the men of old built—a bit at a time and done well. Were all modern English churches carried out in the same way, architects would not complain so loudly as they do that nothing grand is possible. It was too much the fashion nowadays when, say, 7,000*l.* had been got together, to run up a commonplace-looking red-brick barn with hardly a feature in it worth stopping to look at, and the lecturer regretted to say that, in not a few instances, these unsatisfactory structures had been erected out of the proceeds of a demolished Wren church.

Edinburgh Cathedral was then shown as a specimen of the Early English style of Sir Gilbert Scott, not unmixed with some French detail. In fact, he thought the motif for the cathedral was the church of Braisne near Rheims, while the manner in which the square-ended choir had, by the mode of vaulting adopted, been made to assume when viewed interiorly an apsidal character, was derived from the lady chapel of St. Etienne at Auxerre.

The cathedral of St. Fin Barr at Cork, begun in 1862, opened in 1870 and completed nine years later, was cited as one of the very few ecclesiastical works of William Burges which that gifted man had been allowed to carry out unhampered by pecuniary considerations.

Designed in that bold, vigorous, late twelfth-century French style for which he had a predilection, Cork Cathedral was a striking example of Burges's skill in a branch of ecclesiastical art in which, perhaps, he was unrivalled—iconography.

Before concluding Mr. Bumpus said he could not resist throwing on the sheet views of the Oxford college chapels of Exeter, by Scott (1858-60), and of Keble, by Butterfield (1873-76). Each was in its particular style a masterpiece, and exemplified how very differently architects of eminence could manipulate the apparently simple idea of a college chapel.

In the latter, as far as proportion went, Mr. Butterfield, the lecturer opined, had approached the sublime in architecture, but he ventured to assert that had the distinguished author of such works as St. Augustine's College, Canterbury, St. Matthias, Stoke Newington, and St. Alban's, Holborn, given less rein to his fancy in the matter of structural polychromy, its circle of admirers would have been far larger than it was at present.

The lecturer said he had now given them a tolerably comprehensive idea of some of the most important churches raised in England, France and Germany from the end of the eleventh century to the beginning of the sixteenth.

The ecclesiastical architecture of these three countries of Northern Europe had each its characteristic features, but of all, the vivid and varied impression produced in beholding such an infinite variety of detail and general expression was nowhere so strongly marked as in England. In France we admired not only the enormous height to which architects of that country carried their buildings, but the skill evinced by them in the disposition of their ground plans—unequalled in Europe—the beauty, vigour and profusion of their sculptured imagery, and the nervous manliness allied with delicacy patent in all the churches of the best period, particularly those in the Ile de France and Normandy.

Such commendation, Mr. Bumpus regretted to say, could not be extended to German architecture, for delightful as were the recollections of all he had seen there—and he counted such churches as those of Cologne, Münster, Paderborn, Soest, Halberstadt, Erfurt and Trèves among his oldest and most valued friends—he could not close his eyes to the fact that in many respects it fell immeasurably below that of France and England.

But if the German churches fell far short in point of structural excellence, Mr. Bumpus observed they were richer in that they retained so much of their ancient furniture, the churches of Northern Germany especially, and if his listeners wanted to study Mediæval rood-screens, tryptichs, choir-stalls, stained-glass, vestments, tapestry, ironwork and such matters of more strictly ecclesiological interest, it was to this part of Europe they must turn their steps.

There was, too, something mysterious about German church architecture, for, unlike that of France and England, it could not show those beautiful gradations and dovetailing of styles, there being gaps in the chain difficult to account for, and this made its study one of no little perplexity though at the same time of high interest.

Whence, asked the lecturer, came all this variety? Trafficking spirit of composition? The putting of round for square and the acute for the depressed, just for the sake of variety? No; men of mind were at work, men whose genius was not exhausted by a single effort, uniting great originality with patience and enduring labour, and a thorough systematic education in their art. In our English cathedrals—which surpassed those of France in variety of planning, simply because their architects did not conceive them on such gigantic scales, and were thus enabled to play with their outlines by the addition of chapels and, as at Beverley, Canterbury, Lincoln, Rochester, Salisbury, Worcester and York, by secondary transepts to their choirs—the endless variety of Pointed architecture not only appeared in the differences of building from building, but in rich profusion in the different parts of the same edifice.

So distinct and so peculiar was the character of each, that to confound one with another were impossible.

This, however, could hardly be said of the French churches, except perhaps by those who had studied each one particularly.

Nor was it only in the cathedrals and abbey churches of our land that this variety of outline and this delicacy of detail was perceptible, but in the parochial churches which were its pride and glory. When all these noble structures arose machinery was not invented. The endless forms had all to be honestly cut in stone, and the artificer relieved the monotony of his labours by varying it according to his fancy, by bringing out the creative faculty of the soul, giving strength to the arm, and stamping on the result a living character which no tame copying could ever attain to.

Before sitting down Mr. Bumpus drew attention to the collection of casts in the South Kensington Museum, the Crystal Palace and the Architectural Museum in Tufton Street, Westminster, to procure which many of the buildings brought before their notice that evening had, at great cost, been laid under contribution.

ARCHÆOLOGY OF BANKING.

A LECTURE was delivered by Rev. Professor Mahaffy on "Banking in Ancient Times," in Dublin, under the auspices of the Institute of Bankers. Mr. Andrew Jameson presided, and in opening the proceedings said that he was only expressing the feelings of the whole Institute when he said how deeply they appreciated the kind way in which the Provost and Fellows of Trinity College had aided them in their effort to establish the Bankers' Institute. In doing so they were helping to make the young men of Ireland to think more of education and literature, and in that way furthering the cause of which they looked upon Trinity College as the main fount in Ireland.

Professor Mahaffy said that Sir John Lubbock on the

:casion of his last visit to Dublin, when he delivered the augural address at the opening meeting of the Institute, had id :—"I think you will agree with me when I say that the ink is essentially a British invention. The Jews were great anciers, but never bankers in the British sense of the term." he first statement struck him (Professor Mahaffy) as more an questionable at the time, but as Sir John Lubbock's thority was so great he did not think it right to contradict it. nce then, however, he had made it his business to go into e conditions of primitive Greece to see what there was to rrespond in that age and country with the present-day banks d banking. In Dr. Murray's Dictionary a bank was de-ribed as "an establishment for the custody of money received om or on behalf of its customers; its essential duty is the ayment of orders given on it by its customers; its profits arise ainly from the investment of money left unused by em." Could they find that banks in such a sense existed in reek antiquity? They knew that the Greeks and Phœnicians ere great financial nations; and Tyre, a city without territory, quired enormous wealth entirely by commerce. Was it nceivable that all this was accomplished without the inter-ediary of a bank? The most obvious bit of evidence that curred was this. In a lot of Latin plays which were transla-ons from the Greek you met with a person called a "trapezita" -"trapeza" meaning a four-footed table, corresponding to e "bank" or "bench," which was the word used by the early alian bankers. From this it appeared that people did not ep their money at home, but in charge of this person, who as essentially a banker, and they sent orders to this man hen they wanted to draw their money for themselves or hers. So far, they would agree with him that the duties this person corresponded accurately with the definition a banker given in Dr. Murray's Dictionary. Another uty they fulfilled was the exchange of foreign into home oinage; and as to this, there were then, as now, fre-uent complaints that the fee charged by the bank was too xtravagant. If they went back to much earlier times they ound the original banks to be temples. The great temples of elphi, Delos and Olympia contained not only the property f the gods but also the money of many Greek states. The mples also had private property of their own—land and money btained by fines—and, so far as they had this property, they nt it out at interest, especially to other communities; and me communities when in want of money in time of war were the habit of obtaining forced loans from the gods. The vidence of this was contained in an inscription in marble und in the Acropolis of Athens and in the Temple of Delos. he lecturer gave an account of some of the banking operations f Pasion, whose bank, he said, had fifty talents of capital in it -equal in purchasing value to about 100,000*l.* at the present me. The credit of Pasion was so high that his son, who was spendthrift, when out on public duty was able to get money henever he chose by merely stating that he was the son f the banker, Pasion of Athens. Pasion had a slave, hormis, his business man, and to him, when he was imself growing old, he leased his bank for ten years at 60*l.* a year—a large sum in the pecuniary conditions of the ountry. Litigation subsequently took place about the bank, nd one of the arguments on behalf of Phormis was that in a nancial crisis in Athens, during which the other private ankers, who had not to pay rent, had gone smash, he, despite is rent, had kept up the credit of his bank, and so saved the redit and security of many citizens of Athens. The lecturer hen turned to Egypt under the Greeks, and said they learned rom papyrus and from tablets that a great banking system xisted under the Ptolemys. The Royal Bank would probably e offended if he told them that their title was as old as three enturies before Christ, for not only in Alexandria, but in rivate banks in nearly every village in Egypt was that title to e found at that time. They found thousands of documents in hich there were receipts given for money paid into these anks, and the Government farmed these banks in particular ities to individuals for different considerations. The lecturer, aving exhibited some photographs of banks' receipts of this arly period, said there was one document also which showed hat the Phœnicians were in the habit of using token money. n conclusion, he said all he claimed to have done in his lec-ure was that he had shown good and satisfactory reasons for aying that banking was not a purely British invention, but as in all its main features known and practised by the ancient reeks.

The Fifth Members' Meeting of the Liverpool Architectural ociety will be held at the Law Library, 41 Castle Street, on Monday next, the 20th inst., at 6 P.M., when a paper will be ead by H. Bloomfield Bare, F.R.I.B.A., entitled "Notes on American Architecture," illustrated by limelight views, to be ollowed by a paper by James H. Cook on "New York Office Buildings," illustrated by drawings and photographs.

ST. GEORGE'S CHURCH, LIVERPOOL.

A MEETING of the finance committee of the Liverpool Corporation was held on the 16th inst. in the Municipal Offices, Sir Thomas Hughes presiding, when the subject of the removal of St. George's Church was considered and a deputation was received.

Councillor Dalton, on behalf of the ratepayers in Castle Street Ward and Peter Street Ward, expressed the opinion that if the church in its entirety were removed and the site made an open space, it would be beneficial not only to the ratepayers but also to property owners in the neighbourhood. It would certainly considerably improve the appearance of the city at that point.

Mr. T. D. Philip said his firm had been in South Castle Street for a period of sixty-five years, and he had been there for forty-eight years. The street had never been a good one, and the feeling in regard to it was that it could not progress. It was crowded with so many men standing outside buildings that it was sometimes not fit for ladies to proceed along the thoroughfare. He had complained over and over again to Captain Nott Bower and asked him could he not make the street a little more respectable.

The Chairman reminded Mr. Philip that they were not considering the question of men loitering about; with that they had nothing to do.

Mr. Philip pointed out that full advantage should be taken of the opportunity to remove the church altogether and convert the place into a garden or ornamental ground, which would beautify the town very much and improve all the property in South Castle Street. In the centre of the site might be placed a monument to Mr. Gladstone or to Mr. Rathbone. Further, it should be borne in mind that it was the site of the old castle of Liverpool, and therefore historical.

Mr. H. Young remarked that the present edifice was not the original church. The original church was a beautiful design and was erected on the old site of the castle, which stood just at the top of James Street and Derby Square. The chancel of the church was put actually on the rock, and the foundation of the old spire was put in the ditch, the castle moat. The building settled a great deal, and therefore had to be taken down. The present church was commenced in 1809, but was only completed in 1825. In his opinion it was not architecturally beautiful. The re-erection of the church was mentioned in Picton's history, and in Brooke's history it was stated that the new church did not bear much resemblance to the original church. The present church was comparatively modern. He did not think the interests of property owners should be the first consideration; in his view precedence should be given to the fact that it would be a great improvement and benefit to the town by having an open space there where the castle stood. Moreover, it would then be an historical landmark.

Mr. Bellwood said the general feeling of the ratepayers was that this site should be retained as an open space.

Sir Thomas Hughes said he did not know exactly what had prompted the deputation to go there, as he was not aware that either the committee or the Council had intimated one way or the other how this site was going to be dealt with.

Mr. Philip replied that there had been several meetings of ratepayers, and the feeling was that the church should be taken down altogether, so that no portion remained.

Sir Thomas Hughes said it had been decided that the church should come down, but a suggestion had been made that the tower and spire should remain. That you object to?

Mr. Philip: I think it would be very absurd to leave it.

Mr. H. Banner asked whether there would be any objection to a tramways station there?

Mr. Philip replied that they would like it laid out as a garden. There was no town in the country where there were so few open spaces as in Liverpool.

Sir Thomas Hughes: You think Castle Street should be galvanised into fresh life so far as business is concerned. You were always an advocate for a thoroughfare through the Custom House for that reason?

Mr. Philip admitted that that was the fact.

The Chairman thanked the deputation, and said the committee would take their arguments into consideration when they dealt with this question.

Mr. H. Peet, F.S.A., writing to the *Liverpool Courier*, says:—

Allow me to point out that until July 15, 1900, the church is in the hands of trustees, and the Corporation have no power to touch a single stone of the building. After that date the Corporation may consider the question.

In my paper, "Notes on the Churches of St. George and St. John," read before the Historic Society of Lancashire and Cheshire, I said:—"This spire, although possessing no great artistic merit, can in no way be considered an eyesore, and as it is a familiar landmark I should regret its complete disappearance. I venture to hope that the trustees and the Corporation will be able to come to some arrangement whereby

this portion of the building may be retained. It would be quite possible to treat it in a similar manner to the tower of St. Jacques, which forms such a pleasing architectural feature on the south side of the Rue de Rivoli in Paris." Permit me to supplement my remarks by suggesting to the influential gentlemen who formed the deputation that they examine any large map of Liverpool, and they will be surprised to see how small an area this tower occupies, not, indeed, as large as the base of a statue which one of them advocated should be erected on the site. If the tower be allowed to remain, and properly treated, it would form a very appropriate background for a statue of heroic proportions. It is absurd to contend that a detached campanile could in any way detract from the utility of the site as an "open space."

This tower and spire cost 10,000*l.*, the stonework is in a good state of preservation, it fulfils a useful purpose as a clock tower, and I have little doubt that the ground could be utilised in some way for the benefit of the citizens generally. Liverpool has unhappily too few associations with the past that it can afford to think lightly of sacrificing this tower, which if not hoary with age at least marks an historic site.

In conclusion, I wish to express a hope that the powers that be will, in the first instance, only remove the body of the church, allowing the tower and spire to remain for a time, in order that an opportunity may be afforded the deputation and others of studying the effect of a detached clock tower at this important centre, when I believe the cry for its destruction will cease, and instead we shall have a consensus of opinion that its presence greatly enhances the value of the site as an open space.

PUBLIC BATHS.*

(*Concluded from last week.*)

IN the most usual form of bath tank, the walls are constructed of cement concrete built battering on the outside, but I prefer brickwork in cement carefully calculated for strength and well buttressed. The bottoms must always be of cement concrete, and if the foundation is good, 12 inches is quite thick enough. Some advocate building the tank entirely separate from the walls of the bath hall to avoid any possible unequal pressure on particular parts, and consequent danger of settlement. But the immense strength necessary for holding the water alone leaves a very ample margin, and indeed the additional weights of roof, supports and floors help the stability.

It is, of course, of enormous importance to have the tank absolutely water-tight, and this can be obtained by two or three methods. One of the most usual, I believe, is to have a lining of asphalte behind the brick or tile facing, and in that construction it is very necessary to use only the best asphalte, and to have it applied in two layers. I do not think asphalte—vertical asphalte—is exactly a good surface for fixing tiles to, and that is no doubt why so many baths—even that fine one at Shoreditch—are lined with glazed bricks. Six-inch glazed tiles are surely preferable for appearance alone, and the introduction of coloured slips and painted tiles give us a field for decorative effect. A safe backing is obtained with two layers of plain flat tiles laid to break joint, and alternating with renderings in cement. This, together with the tile face, makes an absolutely impervious facing 3 inches thick, and I may add that I have never found the slightest leakage.

In forming the platform round a bath we have to bear in mind that it can never be kept dry, and splashings and the wet feet of bathers combined with mud from the boots of newcomers before undressing would soon render the footways dirty, slippery and dangerous unless they are frequently washed down with buckets of water and run over with the squeegee. They must, of course, be laid to a good fall away from the bath, not towards it, if only to prevent fouling the bath water. A gutter running down in front of the dressing-boxes will lead off the washings. There are more baths than one in London in which this gutter is placed at the back of the dressing-boxes, with pleasant consequences to the unwary bather who may happen to drop any article of clothing on the floor. To avoid this entirely I find it better to raise the dressing-box floors above the platform level, the floor sloping outwards to the channel.

A good curb, indeed the best, round the bath is formed with slate 3 inches or 4 inches thick, and if this overhangs the bath a few inches a wider footway can be obtained at very small comparative cost. It also prevents the bath-water splashing over the footways.

The gutter may be covered with a brass grating, but that is not absolutely necessary. Footways are usually paved with impervious material; wood and York stone have been advocated because they are essentially non-slippery, a matter of great importance. Bathers do not always walk sedately along the footways (in fact, from my observations the sedateness and dignity and statuesqueness affected by bathers are generally washed off in the first plunge), and running along an impervious surface covered with a film of water is dangerous. But it is a pity if we must come down to York paving, with its monotonous colour and cold surface. Tiles laid herring-bone and in small pieces do very well, and there is another flooring which I will not recommend you till I have tried it, but which I think will be better still.

Before we leave the bath itself, mention must be made of the safety rails, which should run round at least 4 inches above the water level. At the deep end the overflow trough serves the same purpose. At the shallow end there should be a spray-rail; that is, a hollow rail, pierced with a line of small holes, and connected with a high-pressure water-main. When the water is turned on occasionally, a regular and even spray is directed on to the surface of the water, which has the effect of cleansing it of scum and floating matter, which are driven down to the overflow-trough.

I must only briefly mention the desirability of marking along the sides of the baths, in plain figures, not only the various depths, but distance in yards from the deep end, and other devices to aid in swimming contests; also the necessity of diving-boards, step-ladders and water-chutes—the latter not being an unmixed blessing. All these matters have their importance, but a short visit to any modern bath will supply all such information.

Dressing-boxes are always placed along the two long sides of the bath hall, and sometimes one end or both as well. Even so, it is impossible to get enough of them in comparison to the size of the bath. At Marylebone we have some short "transepts," so to speak, with boxes on each side, but I do not like the idea. Dressing-boxes out of sight are always liable to be rifled. Want of adequate dressing-box accommodation must be met by some drastic alteration, and I have a glimmering notion or two of some such innovation. To meet this difficulty at the Hornsey Road Baths, the dressing-boxes are placed in a separate room adjoining the bath; but the same objection holds even to a greater extent than with respect to transepts.

A gallery is only necessary in the first-class or racing bath, and need not be more than 6 feet or 7 feet wide, unless we can afford such a one as that at the Shoreditch Baths. It is advisable to have at least two staircases from the platform level.

I do not propose to dilate here upon the various matters necessary to fit the bath hall for use as a concert-room, or for other public entertainments, further than to suggest that if we study the County Council regulations, and then satisfy the Council's surveyor, nothing much is left to be done; but it is vital to bear in mind that these regulations have most important bearings on the planning, and should, therefore, be studied from the very first.

Dressing-boxes for a first-class bath should not, if possible, have less than 12 square feet of area (or, say, 3 feet 6 inches square), although it is possible to do with as little as 9 feet. They may, and I think should, be constructed with wood-framed sides and doors well painted with enamel paint and varnished, or enamel slate divisions may be introduced. If we take care to keep the partitions well off the floor, there is no reason why they should rot. Of course the use of oak or teak is an improvement, but even then I would have it well varnished or lacquered.

When a bath is used for entertainments the boxes are of no use, and the room they occupy is much wanted. To meet this an ingenious arrangement has been lately patented which, although capable of some improvement in construction, enables us to fold the sides, doors and seats neatly and very quickly flat against the walls, where they form a fine panelled dado. They can be seen at the Shoreditch Baths.

With every swimming-bath there should be what is called a soap and spray bath, which may be just one of the dressing boxes fitted up with a foot-bath sunk in the floor with hot and cold shower over. Spray and douche arrangements may be added with advantage. Indeed, it is an advantage to elaborate and enlarge this provision.

As the result of a few remarks made in this room, I have had two long and interesting letters from a superintendent of baths in a Midland city. I shall have occasion to refer to one or two points he brought to my notice later on. But among other matters he described the soap bath of his establishment. He says in his first letter:—

"I like the increasing favour shown for the former [shower] kind of bath, and should be especially pleased to see it supersede our present arrangement of a soap bath as well as the slipper, as that can scarcely be considered a proper system which only allows one change of water for as many as four persons for each change (I am referring here to the soap bath). The same bath-room fitted with automatic feeding showers having a regulated warm temperature, also a separate corner for a cold shower, would hardly use any more water, and even

* A paper by Mr. A. Saxon Snell, read at the last meeting of the Architectural Association.

the dozen I have seen in at once were under the showers, ey would each at least have clean water."

Later on, in answer to my request for the dimensions, he ys :—

"The dimensions are 8 feet by 5 feet by 18 inches deep—ual depth of water 12 inches, therefore equal to about o gallons. A serious drawback, which I did not like to men- on in my last, is the fact that there is no shower with it, so ou may imagine the bathers plunging into the bath to clean iemselves of the soapy water, especially after some dozen or of moulders, mechanics, &c., have washed themselves."

He adds :—

"I am forced to believe that the soap bath is a serious ompetitor of the slipper on account of the cheap prices of the wimming."

Apparently the canny mechanics of the city think a two-enny swim, with the preliminary wash in this delectable soap ath thrown in, very good value for money. But fancy that oap bath after the third man has washed.

This soap bath is necessary not only for lower-class people. n warm weather no one who does not indulge in a daily bath and some who do) can keep their body—and especially feet—n just that state of absolute cleanliness in which—in deference to heir fellow bathers—they would wish to be before entering the ommon bath. Then, too, a cold douche is invigorating after he comparatively warm temperature of the bath.

With respect to swimming-baths, they should be lighted by large lantern with side-lights to open in the roof, and the valls should be lined with impervious material, glazed tiles or ricks for preference. A bath cannot be too well lighted. For entilation—and a bath wants plenty of it—it is desirable to ave an electrically-driven fan. These fans give a lot of trouble ecause they are so soon affected by the dampness. Perhaps ome form of water-driven fan will yet be devised.

Warm Baths.

We have next to consider the warm baths, provided only for washing purposes. The present form is almost invariably the ordinary slipper bath as it is called ; but—to be prophetic again—the days of its general use are numbered. Some of them will always be required, and it is worth while to describe them. The best form is, of course, the porcelain enamelled bath glazed inside and out, and sometimes with a glazed rolled edge. Personally, I always use those glazed inside only, and with a wood top (teak for preference), because the greatly increased cost of outside glazing never worth the better appearance ; and a roll edge, although cleanly, is uncomfortable, and may be dangerous. It also adds even more to the cost. The usual length is 5 feet 6 inches to 5 feet 7 inches from out to out. These baths are usually enclosed in front, for reasons which have never quite convinced me, and I am now omitting the casings. Each bath is fitted up in a very small room, which has an area of 36 feet, but better 40 feet, or as much larger as can be afforded. The walls are generally built up of slate slabs, 6 feet 6 inches to 7 feet high, sometimes left plain and more often highly finished in enamelling. Marble is also employed, but I do not recommend it, and for this reason—it is so necessary to keep these places absolutely clean that any surface which will hide even the appearance of dirt is to be avoided. Inversely, they should not only be clean, but look it, to inspire confidence. It is impossible to see at a glance whether marble is or is not perfectly clean.

Various other forms of partition wall are employed, and notably a thin, glazed both sides, brick wall. I prefer the slate, because with its use no woodwork at all is necessary, even as door-posts. Each bath should be fitted with hot and cold-water taps, fixed on to the front partition with the valve spindles taken through, so that the attendant outside can turn on or off the water. In the same way the waste valve should be operated by the attendant from the outside, but it is desirable to have the means of doing so also from the inside of the room. The floors of these compartments should, of course, be impervious to wet—tiles or mosaic if we can afford it, granolithic for economy. A disagreeable experience has taught me that these floors should be laid to fall. Bathers sometimes splash the water over the sides, and the baths also overflow at times.

Mr. Hessell Tiltman dwelt at some length upon the shower, or rain douche, baths which are in use in many continental towns, and advocated their adoption in this country. At the time, I mentioned that some form of it had been successfully inaugurated by a northern manufacturer for his workmen several years ago. I have since refreshed my memory, and will refer anyone who is interested in the details to a paper read before the Sanitary Institute Congress in 1888 at Worcester by Mr. Charles Clement Walker, F.R.A.S.

The main idea of these baths is that the bather shall not be compelled to bathe in water which has already been fouled by what we may describe as the first washing of his body, but that every drop of water, as it becomes soiled, should be carried wa at once. This idea was adopted over twenty-five years ago by Mr. H. Saxon Snell for lavatories in a poor-law industrial school. It has been improved and modified since in many ways, but the principle remains the same.

Another advantage of such baths is that they could be erected at about half the cost of the ordinary slipper bath, and it would be possible therefore to make a lower charge for their use, a matter of very considerable importance in the great work of reducing the numbers of that class which is facetiously dubbed the "Great Unwashed."

It is, however, very hard to wean the public from old-established customs, however salutary the innovation proposed. It is a good beginning to provide a hot and cold shower to the slipper baths, and in time, no doubt, we shall discard the bath itself. I say we, because I think most of us have a sneaking regard for the comfortable warmth of a casing 4 inches thick of warm water for a few moments, and some of us love the shower—the cold shower—more in theory than practice.

Before leaving the subject, it is well to note the necessity of light and ventilation, and plenty of both in the room. The amount of vapour alone given off from the baths will soon make everything clammy and the atmosphere foggy unless it can be quickly removed. A lantern with opening side-lights is generally sufficient.

I do not propose to deal with medicated, sitz, vapour and other special baths beyond noting that one or two may be included with advantage. Turkish baths in a public institution are as yet exceptional, but no doubt when their hygienic properties are more widely known and when they can be indulged in more cheaply no public baths will be complete without them. By the way, why should it be considered necessary to adopt exclusively Eastern forms and decoration in Turkish baths? They are none too soul-inspiring, and are certainly not "at home." Personally, I propose to break through the tradition in the Stratford Baths, and try the effect of the latest new humour in design. A fair-sized waiting-room, which should be comfortably furnished, is necessary to each set of baths, for there is much waiting to be endured at certain times in all establishments. Water-closets in the proportion of, say, one to fifteen baths should be provided, and they should have direct and separate light and ventilation.

The committee requested me to read a paper on "Public Baths," and I have assumed that the omission of "wash-houses," which are almost invariably associated with the subject, was intentional; and I felt profoundly thankful, because the subject of washhouses is a fairly large one in itself, and could not be adequately dealt with as part of another.

Towel Laundry.

Every set of public baths must, however, have a small, completely-fitted laundry as part of the establishment. This is required entirely for washing the hundreds—may be thousands—of towels and bathing-dresses used by the bathers. Towels, as they are used, are thrown by the bathing attendants into receptacles which are periodically emptied and taken to the laundry, washed and returned to the store or the pay-office. It follows then that there should be easy means of communication between the departments, and this is the best achieved by the subways. If it is possible to have a shoot from each department in these subways a basket or trolley can be placed under to receive the dirty towels, and some labour is saved thereby. With respect to the laundry-room itself, it is only necessary to say that the floor should be paved to falls, the walls should be faced, at least 6 feet or 7 feet high, with white glazed bricks, and there should be ample light and ventilation, mostly from the roof. The machinery should include the usual rotary washing-machines, centrifugal wringers, steeping and rinsing-tanks, and a few wash-tubs. Steam-heated drying horses are also required, and if there is not room for a fair number (and they take a disproportionate space) a cylindrical steam-drying and ironing-machine will do a very large amount of work for the space it occupies. As the machinery must be power-driven, it is always desirable to have the laundry not too far from the engine-room ; but it will be found desirable to keep the two departments quite separate, if women are employed in the laundry.

Engine-room and Boiler-house.

The engine-room and boiler-house should, in my opinion, be quite show-places in their way. Until quite late years these vital parts of the establishment have generally been consigned to odd corners or dark basements, in fact, wherever the ingenuity of the engineer can possibly fit up his boilers, &c. Only two or three years ago I went over a building, but just then erected, which comprised public baths, a gymnasium, free library and technical institute, in which the necessity of a boiler and engine-house had apparently been forgotten; indeed, I believe actually so. So the boilers were put in the subway, under part of the swimming-bath hall, and the engines and electrical plant were arranged in a line along the narrower part of the same subway. The towel laundry was 7 feet 6 inches high, with no light but what could be obtained from little areas

and the communication between it and the engine-room was a doorway 2 feet wide and 4 feet high. It could not be bigger without cutting too much out of the wall-piers. In the smallest institutions at least two steam boilers are required, and if three can be afforded all the better, because with three boilers it is possible to use one for the direct supply of hot water. The engine-room must, of course, be closed off from the boiler-house, and room will be required for an engine, boiler, feed-pumps, lathe and other tools.

The engine-room and boiler-house are, or should be, show places, and perhaps in saying so I am assuming in my professional brethren something of the keen pleasure I personally always feel in the contemplation of machinery and engineering work generally. Perhaps I may be permitted to add that we should none of us be worse architects for understanding a little of the subject. Short of this I do not see any better way of insuring that advance in building so desirable to keep pace with the marvellous development of engineering than a closer alliance with those who have made engineering their study and practice. Professional exclusiveness and jealousy may yet die down sufficiently for this. Already the majority of architects consult the other profession very largely, but not as much, I think, as they will in future. I have not much necessity to do so myself, because it is part of the tradition of my office to lay down the engineering schemes in all their details in all buildings. Yet that very fact has taught me how much this matter affects, or should affect, the design and details of a building. The profession of an architect calls for so wide and varied a knowledge of ever-increasing details that purely engineering work would appear a serious addition to our labours, but certainly the knowledge of so much as applies to the purposes of our own buildings is most desirable. Short of this, it is absolutely essential to acquire so much as will enable us to associate ourselves appreciatively with the professional engineer whom we consult. It would be to the advantage of the building work carried out by engineers (public bridges, for instance) if they would consult an architect—and a good one—and take his advice with respect to the architectural "trimmings." Probably the architect would say, "Don't have any"; but the work as a whole would not suffer.

Adjoining the boiler-house should be a large coal store, and, within bounds, the larger the better. It should have direct communication with the boiler-house and the public street.

Administration.

We arrive now at the administration of the building. The superintendent's apartments should be designed like any other private house, and it should have separate access to the public street. Six, or at most eight, rooms are all that are necessary, and, as I mentioned before, they should be comfortable and as roomy as can be afforded. A board or committee-room is necessary, and our clients will never complain if we lavish a little architectural display therein—and small blame to them. Unpaid public work deserves comfortable and, indeed, elegant surroundings. A superintendent's store for towels, soap and other necessaries is essential. It should scarcely have less area than 150 feet, and may be nearly twice that size with advantage.

If either of the baths are to be used at times for a gymnasium or public entertainments we can scarcely have too much rough storage room, which may be in the basement or even subways.

Without going into many other details which would occupy the rest of the evening to deal with exhaustively, I think it well to mention briefly the important matter of drainage, because there are special conditions to be met in public baths.

In the first place the swimming-bath drains should not be connected to the general system, and if possible each bath should drain direct into the public sewer, with the usual disconnecting trap, &c. If they are connected to the general system the enormous pressure and bulk of the bath-water will quickly choke back the flow from any other part of the building, if it does not even find its way up the pipe into the lower parts. A large sluice-valve is necessary close to the bath outlet. It is important, too, to bear in mind that the outlet should be covered with a close grating. Some few years since, in letting off a certain amount of water to lower its level in a swimming-bath, a boy was drawn by the strong suction right into the outlet-pipe and, of course, drowned. The warm baths may be taken direct into an ordinary drain, provided the latter discharges over an open trap. The end of the drain-pipe should be continued up in iron as a ventilator. A further precaution against foul air entering the room is to trap each bath.

The Midland superintendent I referred to writes me that at his establishment the wastes are carried untrapped through the floor into a subway, which leads the water off to a trap; but he adds that in this case the channel is too shallow, and so the bath water is practically discharged on to the subway floor with unpleasant results. I mention the matter as an instance of the want of that care and forethought which are so essential in dealing with the subject. It is not a bad idea to discharge over such a channel if it is only deep enough and can be regularly cleaned with a hose.

Finally, every part of the drainage should be easily accessible, for delay in removing a stoppage might seriously disorganise the work of the establishment.

Before I close my paper I should like to ask you to recognise the courtesy of the gentlemen who have so kindly lent me—I should say us—the plans which are hung round the rooms. In asking for them I took leave to say that I was sure you would, with me, feel indebted to them for their good nature. Personally, I always feel that it is a duty we architects owe to one another, to the world, or to our country, and not least to ourselves, not to hide our light under a bushel from a narrow spirit of caution (I will not say jealousy) lest others may draw some benefit from the products of our brains. I only regret that this narrowness of vision, or some other motive which I cannot fathom, has prevented one or two architects to whom I applied complying with my request for the drawings just for this evening. The loss is theirs no less than ours.

I fear on the whole I have treated the subject in a very inadequate manner, but if I have succeeded in placing before you matter for a full and interesting discussion I shall be more than content with my effort. The subject is a large one, and I have tried to impart to you in the short time at my disposal as much as possible, and I trust if I have told you anything new, you will in your turn give me of your knowledge in criticism.

The Chairman said it was surprising to find the Germans and Austrians were ahead of the English in the arrangement of their public baths. Foreigners as a rule found fault with the Britisher's love of bathing, but apparently in Austria and Germany the necessity of good baths was more recognised than in this country. It was rather difficult to determine what was the best arrangement to be followed, and there could not be a hard and fast rule laid down for the making of plans for such a building. The engineering work in the construction of a bath would have to be left to an engineer, as architects could not pretend to do such work, but it would be often well for the architect to seek the engineer's advice and work hand in hand with him. The Chairman proposed a vote of thanks to Mr. Saxon Snell for his paper.

Mr. T. Norman Dimviddy seconded the vote, which was supported by Messrs. H. T. Hare, C. H. Brodie, Ernest Herbert and Matt Garbutt.

Mr. Marchant, superintendent of the Marylebone baths, gave some of his experiences.

Mr. E. J. Wakeling, chairman of the Shoreditch baths committee, also joined in the discussion.

EDINBURGH ARCHITECTURAL ASSOCIATION.

At the meeting of the Edinburgh Architectural Association in the Royal Institution on the 8th inst., Mr. Harold Tarbolton read a paper on "Plasterwork of the Renaissance Period in Great Britain, and its Subsequent Phases." Mr. Tarbolton traced the history of plaster decoration from the somewhat isolated attempts of Italian craftsmen to pursue their art in England, and, on the death of their patron Henry VIII., the influx of Germans and Dutch with their strange and sometimes crude displays of decoration; and subsequently the introduction by Inigo Jones of the later and much modified Italian modes. The starting-point of all plaster-work was the moulding of old ceilings, which might be divided into two kinds—those with enrichments modelled in a cast from an impressionable medium such as clay, and those modelled *in situ*. Having described the two processes, Mr. Tarbolton remarked that no beautiful detail and delicacy of execution in plaster-work, as in every other craft, could condone any offence against proportion. Let them take all that was best in conception from the old work; they had magnificent examples within reach. He wished especially to emphasise the importance to architects of a personal and practical knowledge of the crafts. They could not fully understand the capabilities and limitations of any material until they knew its nature and ways of working. Until they had handled clay and worked with hawk and tool in hand and modelled *in situ*, it was next to impossible to appreciate the subtleties of the craft in plaster-work. Architects should at least know thoroughly the interpretation and manipulation of one or more crafts in their endeavour to catch the spirit and vigour of the earlier Renaissance workmen. A great work was being done in the School of Applied Art in Edinburgh in familiarising students with materials and their workings, and he was confident they would see the result in the work of the next few years. The paper was illustrated by limelight views of ceilings in England and Scotland.

The members of the Edinburgh Architectural Association visited Colinton Castle and Redhall on the 11th inst. by the kind permission of Colonel J. M. Trotter and Mr. D. Chalmers. On arriving at Colinton the party were met by

r. G. W. Balfour and Dr. Rowand Anderson, the latter of hom acted as leader at both places. On the way to Colinton astle the Episcopal church erected from the designs of Dr. nderson, and recently decorated in a very fine manner, was amined. Colonel and Mrs. Trotter received the visitors at e Castle, and a description of the ruin was read to the embers. At Redhall, after enjoying the hospitality of Mrs. id Miss Chalmers, Dr. Anderson gave a brief history of the wners of the property and of the destroyed Castle. On the otion of Mr. Thomas Ross, president, Colonel Trotter and [r. Chalmers were thanked for granting permission to visit ie Castle, and a vote of thanks was also passed to Dr. Ander- on for acting as leader of the party.

ARCHITECTURAL SOCIETY OF GLASGOW.

A LECTURE was delivered on Monday, the 13th inst., by Mr. James A. Love Tindal, writer, Glasgow, to the rchitectural branch of the Glasgow Philosophical Society at ie Society's rooms in Bath Street, Glasgow, his subject being "The Workmen's Compensation Act, 1897, so far as it affects uilders and Architects." There was a large attendance of iembers, and representatives from various insurance com- anies were present. Mr. P. Macgregor Chalmers, president, ccupied the chair. The lecturer said that the Workmen's ompensation Act of 1897 was the result of the resistless ressure of public opinion and social progress, which seemed o develop the idea that the State had a paternal responsibility n connection with the relations existing between employers and mployed. By that Act workmen were practically insured at he expense of their employers and the trade, and, as a necessary esult, at the expense of the consumers of the commodities roduced by that trade. So far as the 1897 Act was concerned he law of negligence might have had no existence, as a work- nan coming under the Act was entitled to compensation rrespective of negligence or carelessness on his part, so long is he was not proved to have been guilty of serious and wilful nisconduct. The Act was probably the commencement of a ystem of compulsory restrictions on the freedom hitherto exercised by employers and their workmen, and further legisla- ion extending and emphasising the principles which it promul- gated might be expected. Mr. Tindal thereafter took the Act clause by clause, explaining the effect of each specially with regard to the building trade, and pointed out various conditions which restricted the operation of the Act, particularly that its provisions would not apply unless the building being con- structed, repaired, or demolished exceeded 30 feet in height. A discussion followed, and a vote of thanks to the lecturer concluded the proceedings.

TESSERÆ.

The Beautiful and the Useful.

THE elegance of the ornament not unfrequently attests the stoutness of the fabric. Only into their most durable tissues did the Genoese embroiderers weave their delicate threads of gold; only on the hardest steel did the smiths of Milan damaskeen the gracious phantasies which still keep their armour among the heirlooms of royal halls, and guide the eye of the craftsman to numberless fresh applications of former art, though the armour itself be worn no more. The useful passes away with each generation into new uses. The beautiful remains a fixed unalterable standard of value, by which the useful itself is compelled to calculate the worth of its daily labours. This is a truth which to a superficial thinker will seem dubious. Every profound thinker will acknowledge it at once.

Talleyrand's Pictures.

The collection of cabinet pictures of the Flemish and Dutch schools, formed by Talleyrand, was considered one of the most select in France. It was composed of *chefs-d'œuvre* drawn from the various collections of Hesse Cassel, Malmaison, the Prince de Conti, the Duc de Valentinois, the Duc d'Alva, the Duc de Choisseuill, De Poullain, of Randon de Boisset, De Tolozan, Van Leyden, De Schmidt, Clos, Solirène, the Duc Dalberg and Robit, and had the advantage of being formed under the direction of M. le Brun, one of the most intelligent connoisseurs of the French capital. In the year 1817 Talleyrand having expressed himself inclined to dispose of his collection by private contract, William Buchanan waited upon him in Paris for the purpose of making proposals to purchase them. After a short conversation with Talleyrand, and having examined the collection, he agreed to give him the sum at which the collection had been valued, viz. 320,000 francs, provided he would reserve a Claude, which hung in a situation too high to be examined critically, and make a deduction of 30,000 francs for the same, being the sum at which it had been valued. To these terms Talleyrand would not consent at the time, and would make no deduction whatever; but he desired to take the proposition regarding the Claude into consideration, and to give an answer the following day. In the meantime a gentleman who had introduced Buchanan to Talleyrand wrote a letter to the secretary of the diplomatist, without the knowledge of the former, proposing some modification of the offer in regard to the collection without the Claude, which it appears had given offence either to Talleyrand himself or to his secretary; for on the following day Mr. Buchanan attended by appointment to conclude the transaction (and he had determined not to allow the affair of the Claude to stand in the way of it); he was informed that Talleyrand had gone from home, and that the pictures were no longer visible. Finding his views defeated from this casualty, and no probability of again having an interview with the proprietor himself, and being at the same time informed that Talleyrand had changed his intention of selling this fine collection of pictures, Buchanan returned to England, and had been there for several weeks when he was again informed that this collection was to be sold on July 7 by public sale in Paris, of which he received a printed catalogue. Having previously received intimation that something of this kind might be the case, Buchanan had taken care to have credits in readiness to operate on at a short notice, as one of the principal causes for not terminating the affair at the first interview with Talleyrand was his not having carried credits with him for a sum adequate to that which would have been required, *argent comptant*, had the terms proposed been agreed to; and the affair of the Claude was intended either to create a diminution on the aggregate sum, if accepted, or to keep the affair open until the proper arrangement for the payment of the whole should be made, and the money received from England. On the second occasion, therefore, as he was prepared for the affair, whatever shape it might assume, he set off immediately for Paris to negotiate with the gentleman who, he was informed, had been named as agent for the disposal of these pictures, being anxious to secure for this country so celebrated a collection if it were possible. On Buchanan's arrival in Paris he found that the pictures, although still on the walls of the Hôtel de Talleyrand, had been placed entirely under the control of M. Bonnemaison; and as he was informed that several competitors for them had come into the field, he lost no time in concluding a transaction with that gentleman by which he was to pay 320,000 francs for the collection as it stood described in the printed catalogue, which contained forty-six pictures, the greater proportion of which were of first-class quality.

The Belvedere Antinous or Mercury.

If the gods of Greece be considered not merely through the medium of popular fables, but in that light which the profounder interpretation of mythology reflects on them, then we may understand the otherwise unaccountable contradictions between their embodiment in art and their character in mythology. The human mind, conscious of high attributes in itself, felt the necessity of contemplating an objective ideal in which those attributes were unfolded to perfection as the source of influences to strengthen and exalt. The statue now before us has no apparent relation to the cajoling, thoroughly undignified Mercury, as he is presented by one aspect at least of his fabulous adventures; as the gracious messenger of the gods, the genius of eloquence, the inventor of the seven-chorded lyre, the heroic destroyer of the hundred-eyed Argus, we may recognise him in this statue. The expression is that of god-like clemency, that seems to look down auspicious and compassionate on the sorrows and infirmities of those who supplicate at his shrine. "There is no work of sculpture," says Visconti, "in which the appearance of the flesh is given with such perfection. The head does not yield in beauty of design and execution to any ever produced by the chisel, and has an air so tranquil and divine that the beholder is fascinated; no statue has combined so much robustness with so much elegance; none been imagined or executed in a bolder manner." Visconti was the first who declared this statue to be Mercury, after it had for two centuries been commonly called Antinous; whilst some suggested Theseus, others Hercules, others Meleager, as its intended subject. An antique formerly in the Farnese Palace was found to resemble this so exactly, whilst the subject was evident in the former from the *talari* on the feet and *caduceus* in the hand, that their correspondence as statues of Mercury become unquestionable. The preference given by Nicholas Poussin to this statue as a model of the finest proportions in the human figure is well known; and the number of copies still existing attest the value in which the original (and the marble before us is unquestionably no other) was held by the ancients. A defect in the exterior contour of the limbs has been occasioned by the clumsy expedient adopted in restoring and partly piecing together this statue. The upper part of the leg did not correspond with the outline of the lower, as the fragments had been joined and the surface both of the limb and ankle was rasped in order to reduce it to equality. The trunk of a palm-

tree, serving as a support to the figure, is allusive to the use made by Mercury of its leaves, on which the letters invented by him were inscribed.

The Last Days of Turner.

The death of the great painter was as dismal as his life. He had disappeared, nobody knew where, from Queen Anne Street. Chance glimpses of him were seen from time to time, principally in suburban public-houses, from which the tremulous old figure vanished as soon as it was recognised. His friends, his "Joney" and brother Academicians, would have sought him out had it perhaps been anybody's business, or had there been any clue to his whereabouts. At last his old housekeeper, employing the wits which possibly some woeful vestige of old love or jealousy quickened, discovered the retreat at Chelsea in which the old man had found another dismal bower of Armida. When he was discovered he was dying. He had sent for a doctor from Margate in whom he had confidence who told him his end was near. "Go downstairs, doctor," said the trembling patient with a wistful appeal to the arbiter of life and death most tragic in its serio-comedy and faltering attempt at a jest; "take a glass of sherry, and then look at me again." But this propitiation did not alter the dread verdict; and thus, always sordid in his poor surroundings, apparently preferring the meanest aspect of things domestic, in a house no better nor more refined than his Covent Garden birthplace, the great painter died nameless. They say that in these last dreary days the lonely old man would start from his bed and stumble up with tottering steps to the cottage roof, from which he could see that dark river weltering between its familiar banks which had twined a glistening thread of natural tenderness through his barren life. Despairing feeble eyes, before which the gloom of night was gathering, turned wistful on that stream where still the golden sunshine glories shone upon the darkened tide. Refuged like a wild creature in that obscurity, fled from his vain fame, his useless hoards, the familiar circumstances of his long unlovely life, what thoughts possessed the dumb soul, mutely defiant of all human influences, in that dying gaze upon the light which had no pity upon his failing vision? Too dark for imagination to enter upon, pitiful enough to silence even the necessary verdict of justice, is that last scene in the dark drama. The tragedy was over when the black gleaming Thames, all muddy and miserable, yet glorified with light from heaven, faded from the closing eyelids of the old painter, upon whose murky life a light almost as glorious and as profoundly alien to the turbid stream it shone on had blazed and glistened; but the tragedy is only ineffably pitiful, sad with real human failure and misery—not heroic, nor touched with the elevation of sorrow. No compensation beautifies the dismal loss there consummated and brought to a conclusion. The heart aches that turns away from that dark spectacle. No throb of human conquest over death and forgetfulness, no consciousness of genius triumphant over the obstacles that have fretted its path, swells the breast of the spectator as he turns from that melancholy death-scene. Let the darkest curtain fall over the lost life. Here died a man to whom, by strangest accident, had fallen such a glorious gift of genius as might have indemnified a human creature for all the agonies of existence.

The Palace of Caserta.

About 13 miles from Naples is one of the finest kingly residences in Europe—so say all the guide books, and they are right. Vanvitelli is the very Michel Angelo of palace-rearing. The building was constructed in 1752. Its shape is a parallelogram approaching to a square. Counting mezzanines, it has six storeys besides the attic, and is pierced with no less than 1,700 windows. Its stair, the very perfection of that sort of construction, is vast in all its dimensions and so very easy that you look down from its summit admiring with untried lungs the enormous height you have reached. It starts double from the ground, and twenty persons might ascend either branch abreast and meet one another at the spot where it begins to return upon itself, so that the noble octagonal landing above finds itself just over the starting-place below. From this post four large windows command four spacious courts, and the simple construction of this gigantic edifice stands unveiled. You now begin your journey through vast, lofty, magnificently marbled and very ill-furnished apartments, of which, before you have completed the half circuit of a single floor, you are heartily tired, for beyond the architecture there is nothing to see. The commonest broker's shop would furnish better pictures. Boar hunts, of course, to represent how Neapolitan kings kill boars at Portici, and shoot wild ducks on the Lago di Fusina. There is also an ample historical fresco on the ceiling of the antechamber to the throne-room, on which Murat had caused to be represented some notable charge where he proved victorious; but after he was shot, Ferdinand, with great taste, judgment and good feeling, erased, interpolated and altered the picture into a harmless battle of Trojans against Greeks, or some such thing. The palace has two theatres and a chapel, and you must change your conductor four times if you would be led through the whole. Caserta has cost 7,000,000 scudi. It may have something of the formality of Versailles or Chantilly, but its leading features are essentially English; its thickets and copses abound in hares and pheasants. The ilex attains twice the height we remember to have seen it reach elsewhere. Its islands and fishponds, its kitchen and flower-gardens, put one in mind of a first-rate English country seat. The ornamental water is fetched by an aqueduct worthy of old Rome from mountains 7 miles off, first emptying its whole charge over a high ledge of rock, making a waterfall (which you see from the drawing-room window) over a series of steps and terraces, which get wider as they get lower, till they terminate in a superb basin within a quarter of a mile of the palace, where the water makes its last bound, and forms a broad lake fit for Diana and her nymphs, amidst woods fit for Actæon and his dogs.

CORRESPONDENCE.

Lincrusta-Walton.

SIR,—Having seen in your issue of 3rd inst. the account of the interesting paper about Lincrusta-Walton, which was read on 23rd ult. before the Society of Architects by Mr. Norris for Mr. F. F. Scruby (who is the agent of some foreign manufacturers of Lincrusta-Walton), we would ask you to kindly permit us (so as to remove any erroneous impression) to point out that we, Fredk. Walton & Co., Limited, are the original and sole patentees and manufacturers in Great Britain of Lincrusta-Walton (the Sunbury Wall Decoration); that Mr. Frederick Walton, the inventor of this material, is himself a member of our board and has a very large interest in this company; and that our head office and show-rooms have been for ten years past and still are at 2 Newman Street, Oxford Street, London, W.; and further that this is our only London address, our works being at Sunbury-on-Thames.

Thanking you in anticipation for your courtesy in inserting this letter in your paper,—I am, dear Sir, yours faithfully,

FRED. EGERTON HINE, General Manager and Secretary.
(Fredk. Walton & Co., Limited.)

[We have much pleasure in confirming the above statement.—ED.]

GENERAL.

The Exhibition of the Institute of Painters in Water-Colours will be opened to the public on Monday next.

Mr. W. Clifton, professor of painting at the Royal Artillery Institution, Woolwich, will shortly issue a volume entitled "Notes on Colour: showing how the Laws which regulate Monochrome can in most cases be applied to Colour when Painting."

An "Old Blue," who desires to conceal his identity, has, the *City Press* understands, sent a cheque for 1,500*l.* to the treasurer, through the architects, to defray the cost of providing an organ for the chapel in the new buildings for Christ's Hospital at Horsham.

A Claim for Compensation in respect of a ground-rent of 895*l.*, secured on land in Shepherdess Walk, City Road, E.C., was tried on Tuesday. The jury fixed the value of the ground-rent at thirty-five years' purchase, 31,325*l.*, from which they deducted 1,174*l.* in respect of the reduced rent during the first seven years of an agreement which had been entered into, leaving 30,151*l.*, to which they added the usual 10 per cent. for compulsory sale (3,015*l.*), making a total award of 33,166*l.*

A Paper was read by Mr. W. N. Twelvetrees, M.I.M.E., on "The Mechanical Purification of Public Water Supplies," at the meeting of the Civil and Mechanical Engineers' Society at the Hotel Victoria yesterday evening. Mr. B. Baines Dadley, president, was in the chair.

The next ordinary meeting of the Surveyors' Institution will be held on Monday next, the 20th inst., when a paper will he read by Colonel G. W. Raikes (Fellow), on "The Report (No. 2) of the Royal Commission on Local Taxation, especially dealing with Valuation and Rating in respect of Tithe Rent-Charge." The chair will be taken at eight o'clock.

By a Majority of eight votes to four against, the Selby Urban Council have decided to apply to the Local Government Board for sanction to borrow a loan of 5,000*l.* for erecting baths in the Park at Selby.

THE

Architect and Contract Reporter

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, Imperial Buildings, Ludgate Circus, London, E.C.

For Advertisement Scale, see page xiii.

COMPETITION OPEN.

BRADFORD.—April 14.—Designs will be invited for the erection of the Bradford Corporation Cartwright Memorial Hall, at a cost of 38,000*l.* Three prizes will be offered, value 150*l.*, 100*l.* and 50*l.* respectively. Particulars will be found in another column.

THE church of the Good Shepherd, Murrayfield, which has been erected on a suitable site for the convenience of Scottish Episcopalian worshippers in the Murrayfield district of Edinburgh, was opened on the 4th inst. and consecrated by Bishop Dowden. The church stands picturesquely on the east side of Murrayfield Avenue, having a grove of trees on its south side and a considerable amount of garden ground around it. The church at present consists merely of nave and chancel, with wing for vestries, &c. Ultimately a north aisle and organ transept will be added, and a square tower will be carried up over the vestry wing. The nave is entered by a porch at the south-west corner of the building. At the west end is the font, beneath a large six-light window. The nave is treated with the utmost simplicity, and consists of five bays with plain barrel wood roof. To the north side is the arcade to the future aisle. The pulpit is in the north-east corner of the nave and is of oak, with linen fold-panelling on the wall behind. This is a gift from the Hon. Mrs. Montgomery in memory of the late dean. The west part of the chancel is occupied by the choir, which is one step above the nave. The reredos, reaching 15 feet up from the floor, is in the form of a triptych, the centre panel being carried up above the rest. It is surrounded by a pierced and carved frame, with the dove in a halo of rays at the apex, flanked on each side by angelic figures. At the sides are green stamped velvet wings hanging from iron rods. The colour treatment of the whole is in dull red and gold. In the centre light of the east window is the Crucifixion. The background is filled with diapered lattice glass. The heads of the side lights contain the sacred initials on crowned shields within wreaths. At the base of the window are four crowned shields with the symbols of the Passion. Mr. R. S. Lorimer is the architect.

TENDERS.

ABERDEEN.

For erection of bank-house in New Deer. Mr. R. G. WILSON, architect, 181A Union Street, Aberdeen.

Accepted tenders.

Anaglypta

LONDON WAREHOUSE 92 & 93 GREAT RUSSELL ST., W.C.

THE CHEAPEST SUBSTANTIAL RELIEF DECORATION.

Soho Cowl & Ventilator

(NICKLIN & MILWARD'S PATENT).

This COWL has been used as a Ventilator, both on Workshops and Offices, with most satisfactory results, and has proved a conspicuous success as a House Cowl, possessing as it does great suctional power, perfectly noiseless action, and great durability, being made of steel.

The COWL has proved a perfect cure in the case of most troublesome chimneys.

TESTIMONIALS.

"I consider your cowl far above any other cowl in the market, and have much pleasure in recommending it to anyone suffering from smoky chimneys."

"Forward the 10-inch cowls on order at once; we have fixed the others and find they give every satisfaction."

"Your cowl has proved a complete success, no matter which way the wind blows. Please forward me another one at once."

O ARCHITECTS, SURVEYORS, &c.

The Original Patentees and Sole Manufacturers of the MICA VALVE CHIMNEY BREAST VENTILATOR (patented by Comyn Ching & Co. under the name of "Thomas Boyle's Patent") having suffered for some time past by WORTHLESS IMITATIONS being supplied to Builders and others, which are badly fitted with inferior materials, neither Smoke-proof nor Proof against back-draught, are very noisy in action and soon get out of order,

Beg to call the attention of the Profession to the following fact:—

The only Perfect Ventilators have the Patentees' MONOGRAM CAST IN the front, and the only GUARANTEED NOISELESS is Ching's NEW PATENT SILENT Chimney Breast Ventilator with the NAME and MONOGRAM CAST IN.

TRADE MARK.

Any Infringement of the above Patent or Trade Mark Monogram will be subject to an action at law.

ARCHITECTS SHOULD SPECIFY

CHING'S Patent Mica Valve Chimney Breast Ventilator, or CHING'S New Patent Silent Chimney Breast Ventilator.

TO BE HAD OF ALL IRONMONGERS AND VENTILATING ENGINEERS IN THE UNITED KINGDOM.

TRADE NOTES.

THE extensions to the Ingham Infirmary, South Shields, are being warmed and ventilated by means of Shorlands' patent Manchester stoves with descending smoke flues, by Messrs. E. H. Shorland & Brother, of Manchester.

MR. JOHN GRUNDY, of heating apparatus renown, has sent us on a budget, in book form, of testimonials which he has from time to time received. They number somewhere under 1,000, and it need hardly be said are all highly complimentary. One of the writers even breaks into rhyme in acknowledgment of the virtues of Mr. Grundy's system.

THE ventilation of Cardonald school, now in course of erection (Messrs. Kerr & Watson Johnstone, architects), is being carried out by means of a Mackay's patent direct-acting ventilator of a large size and of special ornamental design, manufactured by the sole makers and patentees, Messrs. Cousland & Mackay, 150 Hope Street, Glasgow. This firm are also carrying out the mechanical ventilation of Messrs. Hay, Nisbet & Co.'s, Limited, printing works by means of electrically driven air-fans.

A FINE new large illuminated turret clock, showing the time upon four external dials 8 feet each in diameter, which are lighted up by electricity, and which is turned on and off by an automatic apparatus, was formally set going on Saturday afternoon by the Rev. Dr. Gibson, D.D., vicar of Leeds, in the presence of the clergy and churchwardens connected with the Leeds parish church. The work has been carried out by Messrs. W. Potts & Sons, clock manufacturers of Guildford Street, Leeds, under the supervision of Mr. C. R. Chorley, F.R.I.B.A., J.P., architect, one of the churchwardens.

"VETROPAKE" is the name given by Messrs. Woolliscroft & Son to a new wall decoration invented by them, which, from its suitability for ecclesiastical decoration, has already aroused considerable interest in clerical circles, and the two panels representing St. Peter and St. John exhibited at the Bradford Congress Art Exhibition effectively demonstrated its capabilities. "Vetropake," which possesses the advantage of impervious ness to the humidity of the atmosphere, is composed of a special plastic body, made or moulded into the required shapes, and fired at high temperatures and fixed in situ in cement of a special character, by which means an indestructible surface which becomes identical with the structure, defying time, is produced. Messrs. Woolliscroft & Son are also the proprietors and manufacturers of special tiles designed for the purpose of lining unsightly walls at a comparatively low cost. They are called "Fresco" tiles. Unlike the ordinary glazed tiles, they present a dead mat surface, and can be produced in numerous colours and to any design.

ELECTRIC NOTES.

IT is announced that the great firm of New York builders presided over by Tom Johnson, the trolley magnate, is engaged in the execution of an extensive order for electric tramways for London.

THE Institute of Electrical Engineers have opened their doors for the first time to a woman, and invited Mrs. Ayrton, wife of Professor Ayrton, to read a paper on Thursday, the 23rd inst., upon "The Hissing of the Electric Arc."

THE interim report of the Brush Company for the half-year ended December 31 last states that the further extensions at the company's works at Loughborough, rendered necessary by the increasing demand for plant and rolling-stock for electric traction purposes, are making satisfactory progress. Various important contracts in connection with electric-lighting and electric-traction undertakings have been secured and are in hand. An interim dividend for the half-year at the rate of 6 per cent. per annum has been declared on the preference shares.

THE municipal electrical installation at Canterbury was formally opened on the 10th inst. at a gathering which was attended by the representatives of the Hackney Vestry, the mayors of most of the Kentish boroughs, and deputations from Gloucester, Newport (Mon.), Leamington, Morley, Bath and Coventry. A sum of just under 20,000*l.* has been spent upon the installation and an additional 3,000*l.* upon a refuse cremator in connection with the works, which, however, is not yet quite completed. The installation was designed by Mr. Robert Hammond. The demand for the current for lighting and for energy has proved quite exceptional, and already a further extension, costing 12,000*l.*, is in contemplation. The light was switched on by the Mayor of Canterbury.

THE necessary work in connection with the supply of electric light to West Hartlepool is proceeding satisfactorily. The position now is that work on dynamos, engines, &c., is well advanced; that tenders for feeders, mains and arc-light heads have been accepted; and that tenders for the erection of the generating station and other necessary buildings will be sub-

ENGLAND
MUST NOT BE BEHIND IN THE MANUFACTURE OF
JOINERY

PARKER'S JOINERY & CABINET CO. L

Have laid down the latest *Joinery Plant*, the *only one* of its kind *in England*. Its turn-out is the largest in the Un Kingdom.

Builders and Contractors, before placing their orders, will find it to their advantage to communicate with the Compa London or Birmingham Representatives, who will wait upon them and give estimates for large or small quantities of Joiner Hard or Soft Woods.

Fixing if desired will be undertaken. Society men only employed.

THE LARGEST MANUFACTURERS OF WOOD CHIMNEY-PIECES IN THE KINGDOM
ESTABLISHED OVER 20 YEARS.

itted to a special meeting of the Town Council at an early ite. Great hopes are being built upon this scheme, not only ecause it will give the town an excellent lighting system, but ecause it is expected that it will before many years bring in a ood profit, which will go towards the reduction of the rates.

BUILDING AND BUILDERS.

HE finance committee of the Newcastle Corporation had nder consideration at a recent meeting the alterations in the eat and provision markets, sanctioned by the Council at a st of 7,000*l*. The alterations involve a new roof and nprovements in the wide alley. The city engineer asked to e allowed to seek tenders for the work, and it was agreed that e should do so.

IT is proposed to erect at the Leicester Corporation's dust-estroying depôt a tipping-shed, boiler and engine-rooms, n-room, chimney-stack, inclined approach to the furnaces, ores, smiths' shop, mess-room, &c., at an estimated cost of 000*l*. The total cost of the works (exclusive of the value of e land) amounts to 13,156*l*.

AT Wolverhampton, on the 8th inst., a brickkiln in course erection on the Bilston Road, belonging to Mr. Herbert olloway, contractor, fell in. Six men were buried beneath a ass of débris. They were conveyed to the General Hospital, here some of them lie in a precarious condition. Two sons Mr. Holloway are among the injured.

THE plans have been passed and approved for the new heatre which Mr. James Kiernan is about to build in Overton treet, Edgehill, Liverpool. The theatre, which is to be a andsome and commodious edifice, is to be called the Queen's. will be fitted with all the most modern improvements for the mfort of the audience and the artistic completeness of the age effects, and it will be beautifully decorated. The work of uilding will be proceeded with at once, and the theatre is xpected to be opened on Boxing Night.

AT a meeting of the finance committee of the Newcastle orporation, the question of the proposed chilling accommoda-on which the Council had agreed to provide at the sanatorium t St. Peter's came up for consideration. The original estimate f the cost was 3,000*l*., but it was now stated that it would pro-ably be from 7,000*l*. to 9,000*l*. In view of this large pro-pective expenditure, the matter was allowed to stand over.

VARIETIES.

THE newly-erected Wesleyan chapel, adjoining the Village Hall, Addlestone, was opened on the 9th inst.

THE value of the estate of the late Mr. George Pearson, railway contractor, formerly of Bradford, Yorkshire, who died recently at his Hertfordshire seat, is 250,000*l*.

THE new English church at Lucerne, which has been erected by the Colonial and Continental Church Society, is to be dedicated on April 14.

A FREEHOLD of about 1,600 feet in Crutched Friars, and abutting on the new street now in course of construction between Fenchurch Street and Crutched Friars, has been sold by private treaty for about 9,000*l*.

THE third Furnishing Trades Exhibition and Market will be held from March 17 to 28 at the Royal Agricultural Hall, London, N., and will occupy every available foot of space. Offices: Broad Street House, E.C.

THE ancient Independent chapel in Fetter Lane is, says the *City Press*, to be pulled down to make way for the extension of the premises occupied by a printing firm. The chapel was established so long ago as 1660. The existing building dates from the year 1732.

THE formal opening of the Leeds new Dead Meat Market and Abattoir has been deferred for some time, but at the last meeting of the markets committee it was stated that possession of the Meat Market will be obtained on Easter Monday (April 3).

AT the second annual general meeting of the Society of Aberdeen Architects, held on the 7th inst., the office-bearers and council for the ensuing year were elected as follows, viz.:—Mr. James Souttar, president; Mr. Arthur Clyne, vice-president; Mr. John Rust and Mr. A. H. L. M'Kinnon, joint hon. secretaries and treasurers; committee—Messrs. William Kelly, A. Marshall Mackenzie, George Marr, George Watt and Robert G. Wilson.

MR. JOHN PILLING, who has held the post of assistant engineer at the Bolton Corporation electricity works since their origination, has been appointed borough electrical engineer at King's Lynn, Norfolk. There were 110 applicants, but finally Mr. Pilling was elected unanimously. The salary attached to the post is 200*l*. per annum, but the works are not yet in operation. With the removal of Mr. Pilling the original personnel of the staff at the Spa Road works will have been completely changed.

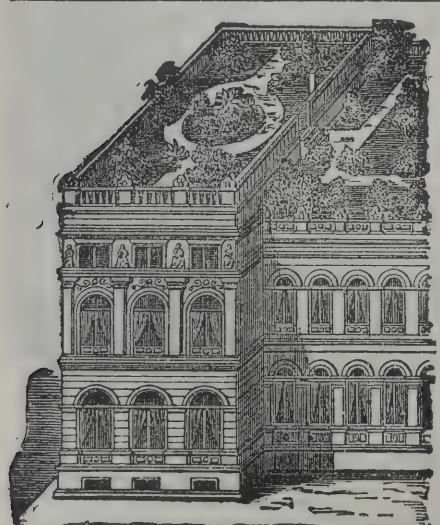
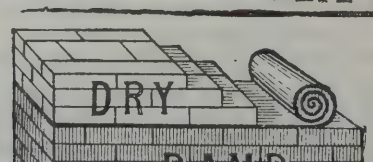
SELL'S "Commercial Intelligence," which has now attained its twenty-first issue, shows a marked expansion of its scope; the news matter, the quantity of which appears to have grown, is even more diversified than it was, and to business men the paper, which has now donned a coloured wrapper, will be found of great utility.

"THE Practical Electrician's Pocket Book," just published by Messrs. S. Rentell & Co, will be found of the greatest utility to the craft to which it is addressed. Of a convenient size and strongly leather-bound, it is replete with useful information on the subject which it professes to treat, and this information is made the clearer by explanatory diagrams. The little work is admirably printed, but unfortunately, with a view to reduce bulk the paper used is terribly thin, which in a considerable measure detracts from the value of this quality.

THE building committee of the Scarborough Board of Guardians have reported to the Board that the additions and alterations at the workhouse have now been completed, at a cost of 10,246*l.* 18*s.* 11*d.*, being 356*l.* more than the original estimates. The scheme included the building of a new board-room, the extension of the infirmary, a new laundry, and completely new baking and cooking apparatus.



THE committee of management of the Art Gallery have adopted a scheme for the improvement of the gallery at Schoolhill. It will embrace the placing of cupolas in the side roofs, the laying of the floor with pitch pine blocks, the erection of an orchestra gallery over the doorway, and the construction of turnstiles at the entrance hall. The improvements are to be carried out forthwith, with the exception of the flooring, for the laying of which there is not time until after the forthcoming exhibition in connection with the Trades Council.



THE Department of Science and Art has received through the Foreign Office a communication from the Director of the Commercial Museum, Philadelphia, calling attention to a Universal Commercial Congress and Exposition to be held there under its auspices during the autumn of the present year. There is being erected for the purposes of the Exposition a series of buildings in which will be displayed such American manufactures as are most representative and best adapted to foreign requirements; but it is intended also to accept as exhibits similar articles from European manufacturers, in order to afford an opportunity for a thorough and comparative study of the world's industries. The Congress will be presided over by the President of the United States at the opening session on October 10, and all nations will have an opportunity of being represented and having a voice and vote in its deliberations through duly accredited delegates sent by the various Governments and commercial organisations.

THE Alexandra Palace will reopen for the season on Good Friday with a performance of "The Messiah" in the afternoon, and a miscellaneous concert in the evening. The artistes already engaged are Madame Marie Duma, Madame Belle Cole, Madame Alice Gomez, Mr. Herbert Grover and Mr. Charles Copland. The Palace Choral Society, which has been greatly strengthened, under the directorship of Mr. George Riseley, will, with the orchestra, number nearly 1,200. There are several novel attractions for the forthcoming season, which will include the "Dickens" Bazaar (built to represent scenes from the famous novelist's works), a Japanese village and a "Naval Spectacle" on the lake.

A LARGE number of Midland employers of labour and about fifty members of the Birmingham Association of Mechanical Engineers recently attended at the New Conveyor Company's Works at Smethwick to take part in the official opening of the new duplicate workshops. The visitors were received by Mr. Gilbert Little (chairman and managing director), Mr. E. J. Forster (director), Mr. Pritchard (secretary), Mr. Archie Little, and the heads of the departments. Councillor Jabez Lones, J.P., welcomed the visitors to Smethwick. The new workshops are fitted with more powerful tools than the premises first erected and completed about two years ago. One feature of the new premises is the large hydraulic plant to stamp the Conveyor troughs, elevator buckets and castings, hoppers, shoots and other appliances for the automatic handling of materials. This hydraulic plant consists of very powerful three-throw pumps, accumulators and twin-presses, with rams 6 in., 8 in., 12 in. and 16 in. diameter, with all the dies and accessories for light and heavy stampings. There have also been installed three large punching and shearing machines, radial drills, angle, tee, channel and irregular section iron-cutters and trimmers; large cold saw, for buckstaves and girders, plate mangling rollers; joggling and straightening tools of the strongest build, to enable the company to do the heaviest gas, colliery and general engineering work. After the inspection of the premises and machinery the large party of visitors were hospitably entertained in the new millwright shop, when speeches were delivered by Councillor Jabez Lones and Mr. Gilbert Little.

PATENT
VULCANITE ROOFING

Since the introduction of the patent Vulcanite Roofing into this country it has been adop by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospit Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and sum than under any other roof. When properly laid repairs are never required, and all roofs guaranteed. The roof-surface can be used as a garden, or for any other purpose. The co construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDG TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up t inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 su ficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and require annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.

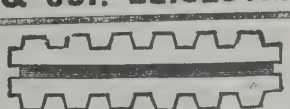
NEW CATALOGUES.

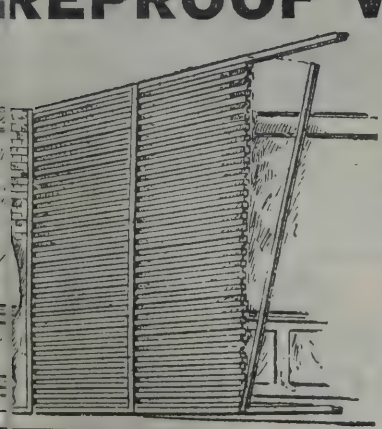
handsome new illustrated catalogue of Lincrusta wall rations, just issued by Messrs. Frederick Walton & Co., ited, will be found of the greatest value to architects and rators, containing, as it does, specimens in sharp relief, in scale of 2 inches to the foot, of the numerous patterns ados, filling, friezes, ceilings, panels, &c., produced by the pany. The method of embossing employed gives an llent result, exceedingly artistic and beautiful, and at the e time conveying an accurate idea of the effect produced he various designs, many of which are quite new, and not w of which, while eminently artistic and effective, are arkably cheap. There are, for instance, no less than thirty-n patterns (dados, filling and ceilings) as low as 1s. per . Of the durability and other excellent qualities of rusta-Walton it is too late in the day to speak, as they well known and widely appreciated, and all those who have use for such a material will be well advised to apply for py of the catalogue in question.

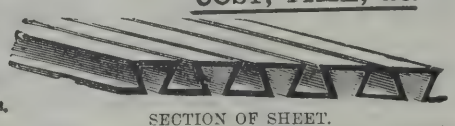
THE new illustrated price-list of the Berkfeld Filter Com- has just reached us. It contains full descriptions of the us filters manufactured by the firm, to the excellence of se wares we have already from time to time had occasion ear witness, and the illustrations include sketches of some patterns which have been recently added to the stock.

ELECTRO-GLAZING.

E months ago, when writing of the Luxfer Prisms, intro-d into this country from America, where they had already ved a very high reputation, by the British Luxfer Prism pany, Limited, of Hill Street, Finsbury, we had occasion nlarge on the merits of their patent system of electro-ng, which at that time was regarded as little more than of the many admirable features of their system of lighting interiors. Since then this particular feature has taken itself a position of enhanced importance, and has proved f a very valuable agent for the prevention of fire. Of this have recently had practical demonstration, and as it is a er of the utmost importance not only to architects but to community at large, it may be well to describe in detail system of glazing. The pieces of glass, which may of any colour or description, and can be cut to geometrical shape, have placed between their edges strips of copper of a less width than the thickness of the glass. These strips are held at their junctures by touches of solder to keep them in a measure firm. The sheets thus formed are placed in an electro bath and suffered to remain there for a matter of about forty hours, during which time a copper deposit is formed on the edges of the copper strips, which effectively closes all the interstices and renders the sheet perfectly homogeneous and rigid. By this means an admirably neat appearance is gained, the maximum of light obtained, and the strength of the glass materially enhanced. In fact, it is not too much to say that every advantage of lead glazing is obtained with absolutely none of its drawbacks.







It is, however, with its aspect as a fire-resister that we are at present concerned, and its value in this respect is extremely noteworthy. In the demonstration to which we referred above a sheet of this glazing of the dimensions of and resembling an ordinary window, and with glass of perfectly ordinary description and weight, was subjected to the assaults of a fierce fire alternated with heavy douches of cold water from a hose, without breaking or appearing to suffer any loss of strength; and another specimen which we saw had been subjected for eight hours to treatment of this description, the only result of which was that the glass was to a certain extent devitrified and in some cases cracked, but the whole was held firmly together by the copper strands, and would in practical use effectually prevent the passage of flame from without, or the admission of air to feed an internal fire, either of which, it need hardly be said, is a fruitful cause of the spread of conflagrations.

REBUILDING IN CRETE.

THE Marquis of Salisbury has informed the Duke of Westminster, chairman of the Cretan distress committee, that Major-General Sir Herbert Chermside has reported by telegraph that the whole of the Mahomedan families who had settled on the farms and occupied the shops and houses of Cretan Christians in the Candia province have now evacuated them. The reconstruction of five villages is now proceeding on a small scale. Sir Herbert Chermside would be glad if further assistance could be sent at once. The committee, being anxious to accelerate the work of rebuilding, earnestly appeals to all who are able to assist the Cretans in settling down and giving them a fair start under favourable conditions to contribute towards raising a sum of 5,000*l.* for the purpose of extending building operations and for purchasing seed-corn

ORK PAVEMENT is NON-SLIPPERY, NON-ABSORBENT, NOISELESS.
Proved by over six years' experience under heavy road-traffic to be more durable than wood.
Recommended by the highest Authorities as the Best and most Sanitary Pavement for **Streets, Stables, Kennels, Yards ents, Church Aisles, &c.**, whether for outdoor work or under cover. Can be seen in London and the provinces in all above uses. r and Bronze Medals awarded, Brussels International Exhibition, 1897, for Hygienic Street and Stable Pavement. and sulphur for the vines, which now require dressing. Sir Herbert Chermside has kindly undertaken to distribute grants to the most necessitous families—Moslem as well as Christian.

THE DAVY IMPROVED ARC-LAMP.

WE had an opportunity a few days since of inspecting, at the offices of Messrs. Eldon, Edmonds & Hayward, Finsbury House, Blomfield Street, E.C., a new arc-lamp invented by Mr. W. Davy, and came away very favourably disposed towards it by reason of its simplicity, its efficiency and the many other advantages over the older arc-lamps which it possesses. An objectionable feature of other arc-lamps (especially when fed by alternating currents) is the humming or buzzing noise with which the public are familiar. Even with lamps of the enclosed type there is always the danger of fire from their imperfect insulation, while with lamps of the open type the danger is accentuated by the constant escape of red-hot particles of carbon. The Davy Lamp is hermetically sealed, therefore no particles can fall and no deleterious gases can escape into the room where the lamp is installed. These improvements render the Davy Lamp peculiarly suitable for drapers' and other establishments where the stock is of a more or less inflammable character. The Davy Arc-Lamp may be used with advantage in domestic lighting, but is quite as suitable as any other form of arc-lamp for street or external lighting; and it is economical, as whereas the incandescent electric lamp consumes four watts per candle, the Davy Improved Arc-Lamp consumes only half a watt per candle. Another reason why the arc-lamp has not become popular for interior lighting is its great weight, large size and clumsy appearance. The Davy Lamp is only about 2 feet in length, weighs only 12 lbs. (as compared with the 30 or 40 lbs. of other arc-lamps), is of a decorative character, and only requires trimming every 200 hours or so, instead of every 8 hours, as in the case of lamps of the open type. While it may be said to be greatly superior to any other lamp at present on the market, the cost of production, owing to its simplicity, is so low that it is difficult to believe it can fail to successfully compete with arc-lamps of any other type whatever. It has furthermore the great recommendation that it can be run on alternating or direct currents at will, and complies with the Board of Trade and insurance companies' regulations.

We were especially impressed by the brilliancy, purity an steadiness of the light, the absolute absence, as before mentione of the objectionable buzzing which is so conspicuous in a ordinary arc-lamp, the absence of carbon deposit on the glas and the extreme simplicity (which, however, as mentioned abov is characteristic of the whole lamp) by which the glass is he firmly in position and is yet instantaneously removable whe necessary for cleaning or other purposes.

THE NATIONAL SYSTEM OF ELECTRIC WIRING.

THE National Electric Free Wiring Company, Limited, Charing Cross Road, claim to be the proprietors of th cheapest, safest and most durable system of electric light present before the public, and as at the present moment electr works are springing up on all sides, and electric lighting i creasing by leaps and bounds, a short description of the syste in question will not be out of place. The wire is compose of twin conductors, insulated from each other and from th lead sheathing with which they are enveloped, the insulatin material being a special impregnated paper. In the 2½ an 5-ampere cables the conductors are solid, and made having semicircular section. In the larger cables the conductors a formed of stranded wires. The conductors are laid up with rapid spiral to insure flexibility, covered with a sheathing of le solid drawn under hydraulic pressure, and completely fill with the conductors and their insulation.

Where the cables are run under floors or buried in plast they are fixed by means of insulated saddle staples or w hooks; where they are run on the face of walls the system fixing is by suitable brass saddles and nails. In every ca where the cable is terminated for a switch, ceiling rose similar fitting, a hollow metal base or wood block containing metal cup is provided, to which the lead covering of the cab is soldered, the base being filled with insulating compoun thus rendering the whole absolutely water-tight. Special d tributing fuse boxes, end connections, &c., are used, but ordinary lampholders, switches, ceiling roses, &c., are suitabl

As a few amongst the many special advantages claimed this system we may cite the following:—Absolute safe leakage of electricity is impossible; less space is occupied th by other systems; great durability; little or no cutting away making good is necessary; no wood casing or other protecti

THE PROBLEM SOLVED.

PRICE LIST AND ESTIMATES ON APPLICATI

equired; high capacity; extremely moderate cost. Safety n fire is assured by the fact that leakage of electricity is not sible. The very high capacity is most important, and ecially is this valuable on alternating current systems. No d casing or other perishable materials being necessary there othing to decay or to absorb moisture; the cables are as ctive in damp situations as in dry ones, and they can, if essary, be buried direct in wet plaster.

The cost is said to be considerably less than the best class ordinary wood-cased, conduit or iron-barrel work.

This system of wiring has been installed in various public private buildings to the extent of about 40,000 lights.

THE AUCTIONEERS' INSTITUTE.

spring meeting of the Auctioneers' Institute of the United gdom was held at Derby on the 10th inst., the attendance g unusually large. The morning was devoted to inspecting ous objects of local interest, and at two o'clock members mbled in the Guildhall under the presidency of Alderman ard Dobson, of Bradford. The proceedings opened with address of welcome by the Mayor of Derby, who was ac-panied by Alderman Sir Henry Bemrose, M.P., after which Council of the Institute went on to the transaction of routine ness. Questions relating to commissions on sales were rred to a committee to obtain information as to custom. he evening a banquet was held at the Royal Hotel. Alder- Dobson again presided, and the attendance included many -known local gentlemen. Mr. James F. Field, a past ident of the Institute, proposed the toast of "Imperial liament," to which Sir Henry Bemrose, M.P., responded, st Sir Thomas Roe submitted "Success to the Auctioneers' itute," the President returning thanks. Other toasts of an ropriate character followed, and an excellent musical pro-nme was also provided.

MANCHESTER PLUMBERS' ASSOCIATION.

annual general meeting of the Council for Manchester District of the National Registration of Plumbers was held he 10th inst. at the technical school, Princess Street. Mr. H. Munroe presided.

The report, submitted by Mr. J. W. Hirst, secretary, stated that the prize competition and exhibition held during the year had given a considerable fillip to the registration movement, whilst in providing the nucleus of a permanent sanitary museum in the city the Council had benefited the building and plumbing trades of the district. A deputation from the Council had, it was stated, waited upon the sanitary committee of the Manchester Corporation for the purpose of securing their assistance in advocating the adoption of the Plumbers' Registration Bill by the Government. All town councils in the district were also approached and asked to take similar action, and promises of support had already been obtained from Oldham, Eccles and Knutsford. It was understood that upwards of seventy town, medical and other councils had memorialised the Government separately, and it was confidently hoped that if the Government could be induced to introduce a Bill it would soon become law.

A satisfactory financial statement was also presented, and this, together with the report, was adopted.

The Council and auditors having been elected for the ensuing year, the meeting proceeded to consider a suggestion that the present age limit of forty-five should be reduced for the admittance to the register, without examination, of plumbers who were well known and produced satisfactory evidence of ability. Eventually the matter was referred to the Council.

A discussion on the registration movement was opened by Mr. J. P. Cox, of Knutsford.

THE LATE JOHN JOWETT.

By the death of Mr. John Jowett, of 29 Tithebarn Road, Southport, at the age of 61 years, there has passed away a gentleman who was well known as a contractor for public works throughout the country. Mr. Jowett was a native of Yorkshire, and carried out many extensive water and sewage schemes in the country, among them the Batley Main, over twenty-one miles in extent; the Wakefield Corporation Waterworks, which comprised forty miles of main; large service reservoir and main for Mottram and Hollingwood; while he contracted for many other public works, mainly in the West Riding. He practically laid out the whole of the streets of Ravensthorp and Brighouse. Mr. Jowett carried out a section (twenty-one miles of 42-inch

main) of the Liverpool Corporation great Vyrnwy scheme, and he had charge of extensive waterworks schemes in South Wales. For a long period he resided at Turvey, in Bedfordshire, where he occupied the Grove Farm for seven years and the Priory Farm for ten years, altogether cultivating 750 acres. Latterly he carried out the Lathom and Burscough and Tarleton water schemes, and had at the time of his death practically completed the Aughton sewage works. Altogether he had been in active work as a contractor for nearly forty years, and was well and favourably known to many of the public engineers of this country. It is calculated that he had in his time laid 250 miles of water mains alone. A little over two years ago he went to reside at Southport.

THE NEW EALING THEATRE.

THIS building is being erected on the site of the old Lyric Hall, with a good frontage, and admirably situated in the Broadway, close to the Great Western and District Railway stations.

Entering direct from the Broadway by one of four spacious doorways one finds oneself in an outer vestible (32 feet by 21 feet), the right hand of which branches to the grand corridor; from here, ascending a few steps, is reached the reception lounge, which will run at the rear of the grand circle across the entire breadth of the theatre; from either side of the grand circle access is obtained to the stalls, and to the balcony or family circle access is likewise gained from the outer vestibule. A corridor direct from the Broadway will lead to the pit. The theatre is being constructed to seat 1,400 persons and is being built without columns, so that an uninterrupted view of the stage will be given from all parts of the auditorium. Special attention is to be paid to the stage, which has a superficial area of 2,700 feet. The whole building is to be of entirely fireproof construction, and electricity solely will be employed for illumination and stage effects. The comfort of the artists appearing at the theatre is not being overlooked, and the dressing-rooms (which are in a self-contained block, and separated from the main building by fireproof doors) will be well appointed and up to date. The County Council's stringent, but necessary, rules relative to exits are being rigidly observed, and the site is well situate for these. The ample and commodious entrances to every portion of the theatre are to be duplicated by a simi number of special exits to be used in case of emergency. T internal fitments and decorations are to be of the most orn and chaste design. The saucer-domed ceiling and the fro of the grand and upper circles will be treated in the ea Grecian Classic period. Panels of wedgwood representi Thespian subjects, divided by small Corinthian columns, are be introduced in the grand circle front; whilst Grecian va alternate with the upper circle panels, the figures of which, low relief, will represent the Fine Arts. The proscenium frar being square and gilded solid, will resemble a huge pict frame, and a representation of a tapestry from the well-kno Baranth collection for an act drop will artistically complete scheme.

In addition to the theatre, the building will contain restaurant, several suites of ball and recreation-rooms, Masonic temple, a grill-room, a café, a billiard-room, a bu and a reading-room. The kitchens, larders, glass and sil pantries, services, &c., will be in the central top portion the building, and connect with service and wine-stock roo on each floor, while the basement will contain an extens range of cellarage.

The building is being erected from plans by Mr. G. Pargeter and Mr. Walter Emden, who is the consulting arc tect for the theatre portion, and Messrs Beer & Gash, Wharf Road, City Road, are the contractors for the wh block.

The Broadway elevation is being built in biscuit-colou terra-cotta by Messrs. Doulton, and the back elevation being treated in fancy brickwork. The north-west corner be capped by an open-domed top turret.

SALE OF AN OLD MANCHESTER CHAPEL.

A MEETING of the trustees, members of the former congre tion, and others interested in the Coldhouse Baptist cha Thorniley Brow, Shudehill, Manchester, was held on the inst., to consider the question of the proposed sale of chapel. Situated off a narrow side street, says the *Manche Guardian*, the visitor to the chapel has to grope his way t through a dark passage, in the middle of which there is a s flight of stairs. The chapel has an interesting history, there are associated with it the names of many well-kn

ple who lived in Shudehill in the days when it was a sant residential district. The original chapel dated back to year 1672, and the present building was erected in 1740. congregation which formerly worshipped in it erected a chapel in Rochdale Road, but some of the older people nected with the Coldhouse chapel continued to worship it until about twelve years ago. Then it was closed, to-day it is in a very dilapidated condition, the forms ered with a thick layer of dust, and the side windows and circular window in the roof all broken. Such light as required by the dozen people who formed the meeting furnished by candles stuck in bottles and placed on the ge of the small part of the rostrum that now remains.

Mr. O. Knott, who is acting for the trustees, read the ice calling the meeting, and produced a plan of the proposed w chapel.

Mr. T. E. Hart, who was called upon to preside, moved, hat this meeting of the trustees, members of the former gregation, and others interested in the Coldhouse Baptist pel, Thorniley Brow, in the city of Manchester, hereby resses approval of the application of the surviving trustees posed to be made to the Board of Charity Commissioners England and Wales for authority to effect the sale of the d premises to Mr. James Thomas Pendlebury for the sum of l., and that the proceeds of sale be applied towards the chase of land situate at the corner of School Lane and aver Road, in the parish of Manchester, and the erection reon of a Baptist chapel and school, to be conveyed upon nilar trusts to those upon which the Coldhouse chapel is w held."

In support of this motion, the Chairman said that in view of ancient history of the place it seemed that some one must ve been remiss to allow it to get into its present condition. t they had to deal with the place as it stood, and the trustees ought that what was proposed in the resolution was the best ng that could be done with it.

Mr. C. T. Tallent-Bateman seconded the motion.

Mr. Felix Winnard, an old member of the former congrega-n, who was invited to express his views, warmly protested ainst those present, who were nearly all strangers to him, ning in and taking such action as was now proposed.

Mrs. Helen Platt, another old member, who had been inter-ting various emphatic observations while the other speakers re discussing the matter, joined in this protest. She said e considered it shocking that the chapel should be taken away from a working-class district and placed in a neighbourhood the residents in which could well afford to pay for a chapel for themselves.

Mr. Winnard and Mrs. Platt were informed that the new chapel would be erected in the working-class part of Didsbury, and that if they still objected, after further consideration of the question, they would have ample opportunity of stating their views to the Charity Commissioners. The motion was then put to the meeting and declared carried *nem. con.*, although Mr. Winnard and Mrs. Platt continued to protest vehemently against the whole proceedings. It is understood that the old chapel, if the Charity Commissioners should sanction the sale of it, is to be used as a jeweller's workshop. The building will have to be entirely demolished, however, so that the 550*l.* mentioned in the resolution really represents the value of the site, or at any rate the highest price that was offered for it when it was recently put up for sale by auction.

FIRE APPLIANCES, BALMORAL CASTLE.

On the invitation of Mr. Forbes, Her Majesty's Commissioner, Mr. William Inkster, firemaster of Aberdeen, has visited Balmoral with the view of inspecting and reporting on the fire appliances at the Castle and the various offices connected with it. Owing to an engagement in the south Mr. Forbes was unable to be present, but he had made every arrangement for the visit of the firemaster, who, accompanied by Bailie Lyon, convener of the watching and lighting and fires committee of the Town Council, left by first train, and reached the royal residence at half-past eleven. Here they were met by Mr. Anderson, clerk of the works, and Mr. Reid, household superintendent; and, after luncheon at Craig-Gowan, the commissioner's residence, the visitors were conducted over the numerous buildings forming the establishment. At various points round the Castle proper it was found that there are about a dozen hydrants, the most of them having all the needful accessories, such as standpipes, hose and nozzles. The water supply, which comes from Lochnagar, is stored in a reservoir on an adjoining hill about 150 feet above the Castle. It runs with a pressure of about 50 lbs. to the square inch, and is thus equal to the force which the city itself has for such purposes. Inside the building, however, the arrangements are not so adequate. With the exception of several chemical extincteurs,

none of the many corridors either upstairs or downstairs is provided with apparatus to grapple with a serious outbreak. Corridor engines, in the shape of hand pumps, and an increased supply of chemical extincteurs of modern type, will probably be recommended. The Castle is at present partly lighted by electricity, and by May the installation will have been carried to the upper rooms. This, of course, will still further reduce the risk of fire. Much time was spent in this part of the inspection. The latest addition to the buildings at Balmoral—the Garden Cottage—where Her Majesty frequently breakfasts, was also visited. Bailie Lyon and Mr. Inkster were likewise shown over Karim Cottage, the private residence of the Indian secretary, which has no appliances at hand for the suppression of fire. The byres, stables, laundry and gardener's cottage were also carefully inspected in turn, and their requirements noted; and before leaving Mr. Inkster drilled the servants on the estate in the use of the fire apparatus. Mr. Inkster will prepare a detailed report for Mr. Forbes, making such suggestions as he thinks are requisite for the due protection of the royal residence and its appurtenances.

THE LATE ROBERT NEILL.

WE regret to announce the death on the 5th inst. of Mr. Robert Neill at his residence in Higher Broughton.

An honourable place must be assigned to Mr. Neill amongst the ranks of self-made men. The annals of Manchester supply the names of many citizens who, starting life without adventitious advantages of any kind, have worked their way to wealth and influence by native energy, prudence and sagacity. Of such was Mr. Robert Neill, who was a native of Moffat, Dumfriesshire, and was born in the year 1817. He was one of a large family who all in turn, as they grew up, came southwards, becoming in several cases singularly successful in their respective occupations. Mr. Neill's first engagement on settling in Manchester was in the workshop of Mrs. Trees, a well-known joiner and builder in Strangeways. After occupying for some years the position of a foreman, he began business on his own account in the year 1842. His connection rapidly increasing, numerous and extensive additions were made to plant and works until the appliances and engagements of Robert Neill & Sons attained a place among the largest concerns of the kind in England. Of the numerous and important buildings entrusted to the firm it is impossible here to speak, but a reference may be made to the erection of the Manchester Jubilee Exhibition of 1887. The extraordinary rapidity with which the work was executed was often the subject of complimentary observation by the executive committee of the exhibition. Mr. Neill was induced in 1852 to become a candidate for the Town Council, and was elected as a representative of Cheetham Ward. Ten years later he was made an alderman and assigned to St. Michael's Ward. In 1866 Mr. Neill was nominated for the mayoralty, and at the close of the year's office he was re-elected. During the second term the foundation-stone of the town hall, of which Mr. Waterhouse, R.A., was architect, was laid. In 1888-89 Mr. Neill served as High Sheriff of the county of Rutland.

PATENTS.

The Architect.

THE WEEK.

It was a wise act of the Government to exhibit the experimental attempts of Mr. J. M. Brydon and Mr. W. Young to deal with the most important problem of the new Government Offices. The general opinion on the sketches when seen in the Tea Room of the House of Commons on Tuesday was favourable. What first engages attention is the manifest effort to enhance the interest of the existing buildings. Sir Gilbert Scott's Home and Colonial and Foreign Offices, which have been hypercriticised, appear with towers which would undoubtedly add to the effect of the blocks. The introduction of arches to form entrances to Downing and Charles Streets would also impart dignity to the existing buildings. On the east side of Whitehall Inigo Jones's building, which, as our readers know, is only part of a noble scheme, is turned to account by appearing as a pendant to a duplicate Banqueting Hall, with a grandiose central building. There is at present less architectural variety on the east side of Whitehall, and Mr. Young was desirous to make the most of Jones's work; but it is hardly likely any direct imitation of Inigo's building would be tolerated. In adapting Classic or rather Italian precedents we see a different spirit to Kent's, Holland's, Barry's or Scott's. Mr. Brydon, having a larger and more rectangular site than was assigned to Mr. Young, is able to show more impressive elevations. He has not, apparently, made such sacrifices to gain external effect as was necessary for Scott, who was often charged with making his windows on the first floor too tall in order to satisfy critics like Lord Palmerston. The five storeys shown in both designs present satisfactory offices, and in the highest and the lowest there will probably be not much grumbling from the occupants. Mr. Brydon prefers Ionic and Mr. Young Corinthian. Considered as tentative efforts the sketches are most creditable, and reveal a praiseworthy endeavour to make the most of the opportunities and in an unselfish spirit.

On Tuesday the London County Council adopted Mr. W. E. Riley as Mr. Blashill's successor. The new official has not an enviable position. Having had experience as one of the civil architects of the Admiralty, Mr. Riley must be acquainted with the routine of a large Government department, and should therefore be able to perform all the duties required of the superintending architect. But the appointment will come as a surprise to many. One of Mr. Riley's qualifications in the eyes of the Council is that he has carried out works without the intervention of a contractor, and would therefore be able to assist the Works Department. But we hope he will not allow himself to be inveigled into aiding and abetting the production of worthless estimates. There were forty-three applicants for the office. It is hard on Mr. Riley that Mr. T. G. Jackson, R.A., should have proposed in the *Times* the appointment of a surveyor as superintending architect at a much smaller salary than 2,000*l.* a year. Whenever anybody was required on extraordinary occasions Mr. Jackson would have "some artist from outside—architect, sculptor, or painter—and so get the best advice the profession of art can give."

A few weeks ago we described the difficulty of Mr. C. A. Neville, stipendiary magistrate at Bilston, in determining whether electricity could be considered under the Factory Act as "an article." The District Council have premises where the light used for lighting the market-hall is produced. If it were a factory, then a copy of the Factory Act should have been posted in it; and for the omission the inspector summoned the Council. On behalf of the Council it was contended that electricity was not an article within the description of articles contained in the Factory Act, and that, even if it were, there was no sale of electricity by the District Council. The most that could be said was that the cost of the electricity was included in the rent of the stalls; but that this was a hiring and not a sale. Mr. Neville deferred giving judgment until he had examined the subject. On Tuesday he said that, according to the dictionary an article was a commodity, and a commodity was that which was useful or advantageous. Electricity being made at the works required mechanical power and manual labour, and it would therefore come within the meaning of the Factory and Workshops Act if it was an article—as he believed it was—and was used for the purpose of gain. The object of the Act was to include everything it possibly could under its provisions. Electricity was similar to many other things—it could be manufactured, stored, moved about, converted into different uses, and stolen, and that description applied to articles and commodities. The Council gained a benefit by producing the light in the market, and it must be said to be a gain within the meaning of the Act. A penalty of 2*s.* 6*d.* was imposed, with costs 1*l.* 17*s.* 6*d.*

It is rather late to revoke arrangements which were entered into for the Paris Exhibition of 1900, but when the numerous subjects which disturb French minds are considered we can understand how courageous men would be daunted by the extent of the works which must be completed within a year. Among the works which were intended for sacrifice were the pylons and groups of sculpture which were to adorn the Pont Alexandre III. The architects, MM. Cassien-Bernard and Cousin, made them an important feature in their design, and the eminent sculptors, MM. Fremiet, Marqueste, Coutan, Michel and Lenoir, had accepted commissions for the figures. The masses of masonry and bronze were not intended to be merely ornamental, for their weight was expected to resist part of the pressure of the steel arches. A month ago Frenchmen had made up their minds about the necessity of the removal of all ornamental features from the bridge, but the usual reaction has followed, and now the Chamber has insisted on their preservation. We suppose after such an experience the Municipal Council of Paris will no longer hesitate about the erection of the fine palace designed by MM. Gravigny and Lagrave, under the direction of M. Bouvard, which is intended to display the unsurpassed variety of works which the Council have undertaken.

For about a year a by-law has been in operation in Chicago which requires that all plans submitted to the Department of Buildings for building above a certain grade must be stamped and sealed by licensed State architects. If not permits will be withheld for the erection or alteration of the buildings. The requirement has given an impetus to the procedure enacted by an Act which makes registration and licensing a necessity. It appears that up to December last sixty applications were made for examination. Two were withdrawn, eighteen were approved in class examinations, six were rejected, twenty-seven appeared to have been issued without examination and seven have yet to be dealt with. Forty-three licenses were paid for. The Board of Examiners say, "The number of persons who had taken out license was so greatly in excess of what had been anticipated that it was evident that very few men who claimed to be architects in this State had continued to practise in defiance of the law, and had failed to make applications for license and have their cases passed upon by the Board. The results have shown a general acceptance of and acquiescence with the requirements of the law." It is admitted, however, that many persons act as architects without troubling themselves about the law. They cannot be reached. The Board say that to prosecute them would be expensive, and there is no clause in the Act authorising any expenditure for that object. It is also necessary to pay renewal fees to be kept on the register, but a very large proportion of architects are opposed to that form of taxation.

We learn that about fifty architects and engineers have become members of the Irish Club, although it is only a few weeks in existence. The club rooms are at 13, Henrietta Street, Covent Garden. Several architects come to London from Ireland from time to time, and they may be glad to know that a comfortable rendezvous is available and at a cheap rate of subscription. The club is non-political, and on that account is likely to be a success among men whose thoughts are turned to business.

THE TRAINING OF BUILDERS' WORKMEN.

IN our last number we published the recommendations of a special sub-committee appointed by the London County Council to hold an "inquiry into the educational requirements of members of the building trades," but the subject is one which will bear more notice. Why the County Council should assume any responsibility for education in construction, rather than in divinity, law and medicine, is not apparent. The Council was not established for that purpose. It is probably assumed that as the money which is so liberally expended by the Council is derived from taxes on houses, some return is due to the men who erect them. By modern legislation large sums are available for what is called technical education, and a part of it can be disposed of as readily among youths who are ambitious to be builders as among those who please themselves by attempting other callings.

We are not opposed to the communication of knowledge by competent teachers, whether belonging to county councils or universities. We should also like to have more known by the public about architecture and construction, so long as the "little knowledge"—for it can be nothing else—does not make its possessors fussy and disposed to interfere with the work of architects and builders. But we are not disposed to maintain that, unless County Councils and other institutions hasten to the rescue, it will soon be impossible, owing to the ignorance of the workmen, to raise a satisfactory building in Great Britain. It is as easy to obtain excellent work to-day as it was in Mediæval times. But a corresponding price must be paid. If the standard adopted is that of the cheap suburban villas which are to be let on short leases, no one has a right to expect walls, floors, and roofs which will endure for centuries. What the philanthropists and educationalists appear to desire is a religious brotherhood of builders, with members of a self-sacrificing turn who seek no more than a pittance for food and clothing. The Earl of Wemyss this week indicated the kind of workmen which are required. In a letter to the *Times*, apropos of the absurd strike of the plasterers, his lordship advocates that Japanese woodwork should be substituted for English plaster-work, as it is cheaper, for "the pay of these truly artistic Japanese workmen being 7*d.* a day, on which pittance they manage to live and thrive, though their food consists only of rice daily *plus* two or three times a week the heads and tails of fish; they cannot afford to buy the bodies also." Now, although we are not blind to the folly of the plasterers and other building workmen, we have no desire to see them dependent on such a fish diet as Lord Wemyss admires. "Give every man his deserts, and who shall 'scape whipping?" And who knows whether, if aliment were proportioned to the services rendered, that his lordship would not be restricted to heads or tails, and allowed only to enjoy both on feast days? The Japanese workman's reward is very small because in many trades there is an excess of competent labourers, and there is a host of distributors between him and the buyer. It will be time enough, when we have workmen in England who can sustain themselves on fish-bones, to think about the model builders of which so many good people have visions. Meanwhile there must be a relation between the prices paid and the character of the work executed. But those who are eager to build can be assured that nothing has been done in construction which is beyond the resources of English contractors at the present day.

A statement was presented by Mr. Rowland Plumbe to the sub-committee which by itself should allay the apprehensions of those who are panic-stricken about the fate of English building. Of the bricklayers he says:—"Generally the quantity of work done is considerably less than previously. The quality of the work is, I think, better. I should say the men are not so rough as formerly; they seem to me a more intelligent race of men." According to Mr. Plumbe, "Smiths and metal-workers seem to attain great skill in their trade without so much preparatory technical educational work being required, and they are taught more by actually working at their trade." It is said of the plumbers that they seem "really to have tried to get a proper knowledge of their work." Mr. Plumbe, it will be seen, testifies to the proper quality of the work. As to the quantity, there is, as everybody knows, a diminution, which unfortunately is being magnified every year. That, however, arises from causes against which the ordinary courses of technical education are inoperative; indeed, we have no assurance that increased knowledge will not make workmen less disposed to continuous exertion.

That doubt arises from a great many considerations. In the first place, there is no definition of the craftsman that advocates of education have in their mind's eye. We fear he is a very hazy personage. The model working man is not adapted to modern requirements or to modern conditions of society. A builder's staff is like a complicated machine or a multiple organism. Individuality is not of much account. Trades unions cannot tolerate it, and the division of labour can dispense with it. A man may find more inconvenience in doing little than by allowing his force full play, but he dare not exceed the amount of work which the weakest workman can produce. An employer has also to accommodate himself to circumstances and to make the best of men, although they may have less than the average capacity for work. Again, the division of labour is more developed in London and the larger provincial towns than in villages, and on that account a common standard is not easily fixed. As well as we can make out, what is required by the amateurs who profess to have the most intimate knowledge of the builder's business is to make every workman so independent and versatile that he can serve as foreman, clerk of works, employer, surveyor, and architect, without the least hesitation. We shall render due admiration to those Admirable Crichtons when they are produced, but their fitting place is where primitive conditions of life prevail, as in the embryo towns of a colony, rather than on a London builder's job. In endeavouring to create many-sided individuals we appear to be going back to the time of Ulysses, who was a twenty branch hand, according to his own account. It is, we grant, a more pleasing sight to see a workman studying strains than killing time in a beerhouse, but statics of a evening do not next day create an aversion to the rul which limits the output of labour.

It would have been an advantage if the sub-committe had invited a larger number of master builders to giv evidence about the position and prospects of workmen i England. Only two, Mr. Holloway and Mr. Howar Colls, attended the inquiry. The questions asked were thos which were likely to insure answers that would be favou able to the projects of the County Council as an authori on education. But, in spite of the tact exercised examination, there were replies which should have be taken as revelations of some important conditions modern labour. Mr. Colls, for example, said "t brickwork done now was better than ever it h been"—a proof that absence from technical class does not injuriously affect the workmen's ability. Bric layers, he added, could be good men without being able read drawings, and nine out of ten never looked at drawing. A builder's foreman explained the indifferen to drawings by saying that "their work made their ha too rough for manipulating drawing instruments." T chance of qualifying themselves to become foremen d not count for much with them, for, as Mr. Colls s "Carpenters had more opportunity of becoming foremen they invariably remained from the beginning to the end a large piece of work, whereas bricklayers were consta changed." It may be considered desirable that carpen should not retain a monopoly of the foreman's office, men who are subject to changes from the character of t work cannot be more eligible for the appointments. bricklayer's work is hard, and he is hampered by his tr union. If he has to leave off at three instead of at fiv consequence of rain, he dare not endeavour to find c pensation for his loss of time by working on another until seven. It would be necessary in that case to pay at an overtime rate. There is so much which is disag able about the trade it is no wonder that, accor to Mr. Holloway, "Few bricklayers had served apprenticeship, consequently only a small percentage c do good face work and properly understand sanitary w We are afraid the County Council's classes do not pro a remedy for such a state of affairs.

If the subject were investigated, it would be found the conditions of modern life impose restrictions on other building trades. "The plasterers," said Mr. Ho

WAY, "used to cast their own moulding, whereas now it is done by specialists and supplied to the builders." Mr. COLLS also stated that "Much woodwork that used to be done entirely by hand was now done by machinery, and the workman only joins it together. The work done in this way was as good as formerly, in some cases perhaps better." There is no use in contending against machinery, but apparently it is supposed by teachers that workmen are in the same position and should resemble their predecessors, who lived in days when neither steam nor electricity set tools in motion. Besides, as we have said, division of labour has assumed the character of a machine. Trades unionism is no less potent. There are, too, conditions of contract which affect labour. For instance, Mr. HOLLOWAY said, "With regard to a painter, it would be almost a waste of time to teach him anything, as the higher class of painting came under the designation of 'decoration,' and was, strictly speaking, an art. The mixing of colours was generally done by a man who had a special aptitude for the work." These are only glimpses of facts which are well known to all who have much experience with builders' work. They should be, however, of sufficient value to reveal that by attending courses of lectures in technical schools and receiving certificates of successful examinations a student will not necessarily gain higher wages in any of the building trades. He may be utilised occasionally for exceptional work, but, unless he can set up business on his own account, he must expect to be treated like the workmen who have followed the ordinary routine. Young people are deluded when the realities of business are concealed from them, and we are afraid the technical schools are creating a class of men who cannot fail to become more discontented than the workmen who now create trouble for architects and builders.

If we could be assured that the effect of teaching in the classes of the London County Council would make youths enamoured of building processes, and induce them to become apprentices of one of the trades, our opinion might be changed. Apprenticeship is the best of schools for a builder, and it is a serious matter to learn that not more than one in ten of the building workmen of London has served as an apprentice. According to Mr. HOLLOWAY, the majority of those who are bound are the sons of warehousemen, clerks, and tradespeople. The workmen prefer to see their sons in offices rather than working at a bench or on scaffolding. How to attract apprentices is a social question which can only be answered after an inquiry in which the subject is not incidental. Mr. HOLLOWAY suggests the creation of a central authority with adequate funds to deal with apprentices and their training. But so long as parents believe there are more short cuts to attaining wealth and position than are to be found in the building trades—in which all engaged, from architects to apprentices, are insufficiently rewarded—we cannot expect builders will be worried with applications to accept apprentices. Nor is it likely the technical schools will provide substitutes; so long, at least, as the teachers resemble the gentleman described by Mr. HOLLOWAY. He came as an "improver," but as he was found to be incapable of learning he was sent away. He then accepted the position of instructor of a technical class, and, for all we know, may be one of the new professors who descant upon the ignorance of architects about practical work.

COUNT CAYLUS.

IF when delivering the annual address to the students of the Academy in December next Sir EDWARD POYNTER were to refer to an engraving or etching by a French nobleman, of which they all possessed copies, there would be general consternation. But when Sir JOSHUA REYNOLDS, in his first discourse, was extolling the conscientious care of RAPHAEL in following exactly the model which was before him, even in unimportant details of costume, he relied for evidence on a print from one of the painter's studies for the *Dispute of the Sacrament*, which was, he said, by Count CAYLUS and "in all hands." At that time, 1769, the count was no longer living; he had passed away four years earlier. To artists his prints were as well known throughout Europe as BRAUN'S photographs are now. He had produced with his own hand, according to a dictionary of engravings which appeared in 1767, no less than 200 prints, after drawings by the great masters, in the "Royal Cabinet;" a collection of about 300 heads from originals possessed by M. CROZAT; another series from drawings, mostly caricatures, by LEONARDO DA VINCI; a variety of pieces after BOUCHARDON, and others not named. The numbers do not express more than a fraction of CAYLUS'S work on copper.

The Louvre possesses a catalogue of his etchings in four folio volumes, which he prepared himself. It contains 663 pages, and on each there are from two to eight prints. CAYLUS believed he had engraved about 3,000 subjects, and experts say he underestimated the quantity. He also assisted some of the professional engravers whenever they were engaged on subjects which appeared likely to promote the purpose he had in view. For it is well to remember that Count CAYLUS did not produce plates as commercial transactions. He was a stubborn, some would say a pig-headed, man who insisted on realising his own ideas, regardless of the labour and expense to himself. Having arrived at the conclusion that artists would derive more advantages from the possession of copies of studies, by great masters, than from occasional visits to public galleries to see the paintings, he became an engraver. He believed in deeds rather than words, as became a soldier; and so much success was attained in distributing his copies, Sir JOSHUA REYNOLDS was able to speak of the prints as if they were possessed by all English students of art.

At the time the President of the new Royal Academy mentioned the Count as a well-known amateur, CAYLUS was a subject for consideration by students of philosophy in all parts of Germany. It was not as a benevolent friend to artists who was willing to work with his hands to benefit them that he was noticed in Germany, but as a classic archæologist who had put forth theories which afforded subjects for endless discussion. One of the controversialists became renowned. In 1766 LESSING published his "Laocoon." To say it was an era-making book would be only employing a commonplace expression. But when we know that GOETHE credited it with being a powerful factor in the formation of his mind, and that MACAULAY owned he learned more from its pages than he ever learned elsewhere, we may conclude that over many inferior men the "Laocoon" has exercised an influence that is incalculable. Now the book is mainly a reply to three writers. One was the Rev. JOSEPH SPENCE, whose "Polymetis," or inquiry concerning the agreement between the works of the Roman poets and the ancient artists, although considered as obsolete, should be possessed by every student of classic art; the second was the Abbé WINCKELMANN, in whose essay on the imitation of Greek works in painting and sculpture the remarks are found which served as a text for LESSING'S book; the third was Count CAYLUS, who had published a collection of plates entitled "Tableaux tirés de l'Iliade, de l'Odysée d'Homère et de l'Enéide de Virgile, avec des Observations générales sur le Costume."

Between LESSING and WINCKELMANN there was not much difference. The Abbé's offence was venial, for all he said was that VIRGIL was not as refined as SOPHOCLES in describing LAOCOON as roaring like a wounded bull when he found he was imprisoned in the coils of the serpents. The sculptor, on the contrary, treated the subject, as SOPHOCLES had done in the case of PHILOCTETES, by representing the priest as uttering a constrained sigh. SPENCE, on the other hand, was guilty of proposing the heretical doctrine that VIRGIL had derived his description from the group of sculpture, and in doing so he followed the practice of the ancient poets who owed their inspirations to paintings and statues. Count CAYLUS extended SPENCE'S theory, for he maintained that the best test of a poem was in affording subjects for pictures. From the success with which that test was borne by the "Iliad" and the "Odyssey" he advised all painters to study HOMER, who could supply them with innumerable subjects. In other words, the poet had preserved records of ancient art; and by illustrating his scenes, painters and sculptors were restoring the works of their early predecessors. If generally accepted, such a theory would put an end to all subjective poetry, which is the most expressive to the German mind; and Englishmen

must be always on the side of LESSING, and against their countryman SPENCE, in opposing conclusions which would be fatal to whatever is emotional in their literature. When LESSING asked whether, if HOMER's works were lost, and we were forced to be content with illustrations like those prepared by CAYLUS, should we be as much impressed by them as we are by the poet's words, he could have no doubt of the answer of the German race. Art has its own province, so has literature, and each can be advantageous to the other. To supersede either would be folly, and LESSING was justified in his endeavours to define the limitations between the two.

There is, however, some excuse for CAYLUS. He was overcome with the greatness of ancient art, and wished that the world should admit its supremacy. Like all zealots he could not be impartial, for his mind was under the sway of a bias which was not to be overcome by reason. It should also be remembered that the education of CAYLUS was rather fortuitous. It was through art he was enabled to realise there was in life something of more interest than animal pleasures, and that his existence could be made useful for his contemporaries without any loss of individuality.

For as an archæologist Count CAYLUS was as self-opinionated as he had been in engraving drawings. He anticipated CARLYLE in believing that the knowledge or connoisseurship which holds good for working was alone worth having. Public galleries and royal cabinets might be filled with ancient objects which would excite amazement; he sought to obtain those which would convey lessons or suggestions to artists. He was enabled to gain the aid of an Italian Abbé named PACIAUDI, and almost drove the poor man distracted with his requirements. All the accepted principles of collecting were set aside. At one time he was more eager to have fragments than a perfect object, for he maintained there was more knowledge to be derived from them. At another time he professed indifference to masterpieces. Where was the modern artist who was likely to rival them? Give him common everyday productions which could at least be imitated. PACIAUDI was a scholar of experience, and, moreover, he was honest. He endeavoured to carry out his patron's instructions, but repeatedly he sent things to Paris which were more adapted for an ordinary collection of curios. The dealers in course of time were able to supply what he sought, but CAYLUS was more sharp-sighted and realised that his agent was victimised. In those days the manufacture of antiquities was a recognised industry. CAYLUS dealt with the forgeries in a philosophic and businesslike manner. He despatched them to England or Germany, where they realised far higher prices than he had paid for them. Collectors must not be tried by ordinary ethics in the acquisition or disposal of treasures.

If we inquire into the circumstances which made CAYLUS an amateur, a puzzle awaits us. He did not belong to a family that respected the arts. His family was ancient, but at the time of his birth their position was not exalted. His father was too coarse to be allowed near the court, and, as if he were a bear, LOUIS XIV. ordered him off to a remote region of the Pyrenees. His mother belonged to a Huguenot family, and was treated as a niece of Madame DE MAINTENON. When he was twelve his father died, leaving his mother poor and unable to provide for him. But Madame DE MAINTENON's influence was equal to a fortune. CAYLUS was able to enter the army when he was fifteen, and he took part at Malplaquet in those furious and repeated charges of the famous "Maison du Roy," which Colonel ESMOND has described. Like the Colonel, the young Count escaped unhurt, and when he returned to Versailles King LOUIS took him on his knees and petted him as a hero who had slain one of the royal enemies. In a year or two he was a colonel, and before he was out of his teens CAYLUS was considered to be a soldier who would be justified in expecting a marshal's baton. Just then there was a reaction. France was wearied of glory, and was glad to have peace. CAYLUS became disgusted with the prospect of settling down as a quiet citizen. He decided to leave a country that was unworthy of so promising a warrior. He travelled in Italy and Germany, and then came back to play the part of an affectionate son.

Eight months afterwards an opportunity occurred which enabled him to visit Ephesus. The sight of the temple appeared to work a revolution in the mind of CAYLUS, who was then about twenty-four. All his notions of ancient art were changed. He next visited Greece in the hope of discovering Troy, but he had not pursued his explorations far before home-sickness again seized him and he returned to Paris. The Luxembourg then served, like Hampton Court, to shelter people who were very poor and very proud. Madame DE CAYLUS was among them, and her son was glad to share her apartment.

His experiences in Greece created a love of art in his breast. He made the acquaintance of MARIETTE, the collector, who was the son of an engraver and with CROZAT, who was the patron of WATTEAU. The artist found a pleasure in teaching CAYLUS, who gradually became known as an amateur who had more claims to be considered as an authority than the majority of his class. He began to acquire studies. JERVAS, the English painter, was said to possess a hundred of RAPHAEL's drawings. CAYLUS came to London to negotiate for them. He was disappointed with the English amateurs. They possessed precious things, but were unable to appreciate them. Lord PEMBROKE was said to have a collection of drawings ranging from CIMABUE to CARLO MARATTI. But some were destroyed, others were torn or cut. If a drawing was too large for a portfolio it was folded in four, although it might be the work of RAPHAEL or CORREGGIO. The voyage to London apparently cured CAYLUS of all desire to travel outside French boundaries.

On his return to Paris the Count appears to have taken up the production of engravings after the drawings of the old Italians with ardour. What happened in England might happen in France, and drawings like those of Lord PEMBROKE disappear without any means to recall their appearance. He resolved to do something towards providing a record. He seems to have become possessed of wealth, and he devoted a large part of it to sustaining his hobby. In 1731 there was a recognition of his services, for he was elected a honorary member of the Académie Royale.

It is remarkable to find that in a society containing many able artists CAYLUS should become so much of a power as in course of time to be considered the representative man of the Academy. His essays received most attention; his suggestions were adopted without the usual dissensions; his decisions were accepted without any appeal. What was the secret of so much authority, which exceeded that exercised by COLBERT, who was the greatest benefactor of the Académie? In a great measure it must have been owing to the sincerity of CAYLUS's interest in artists. Apparently he had no desire to impress his fellow-aristocrats with the belief that he was a man of genius. He cared little for his own order or for society. There was no pretension with him of ability or of virtue. But he loved art, and was willing to show his affection in any manner that was desired by the artists. It was for that reason he took up collecting, advocated the study of HOMER, and founded prizes for students. The Count realised the full extent of the reaction which followed the reign of LOUIS XIV.; and as he was afraid that French artists were by degrees descending to common life for subjects, he endeavoured to bring them back to the austere grandeur of which NICOLAS POUSSIN was a representative. That was the more remarkable, for in his own daily life he was prone to sinking to a low level.

In the new Academy of Inscriptions he was no less of a magnate than in the Academy of Painting. In France every generation presented a succession of men to whom the ancients were of more importance than their contemporaries. But their knowledge was based on the statements found in books, and they did not consider they were under obligations to test what was recorded. CAYLUS cared little for book learning, unless it was applicable to support some of his own theories. He preferred experimental archæology. There were whole classes of statements relating to laws, institutions, religions, manners, which he could not verify. But if there was the least allusion to an art or manufacture CAYLUS was able to test it, and from the results could draw inferences about much else. He demonstrated, for example, that two of PLINY'S varieties of encaustic painting could be executed.

But there were also two varieties for which the instructions given were of no avail. What more was needed to warn readers against the general acceptance of all PLINY's statements? On another occasion Roman swords were found which, as they were made of an alloy of copper, were supposed to be merely intended for use in ceremonies. CAYLUS produced a similar alloy, and turned it into swords which were found to be adapted for attack and defence. It was inevitable that he must often be erroneous in his conclusions. As he believed he understood the technical descriptions of ancient writers more exactly than other interpreters, he attempted a restoration of the Mausoleum. As an architectural work it is not successful, and it has not been in the least details corroborated by the remains of the monument which were subsequently found, and are now in the British Museum.

CAYLUS, by his peculiar system of applying science to archæology, should have a place in history. But his fame depends on a few lines in a biographical dictionary. His efforts to have antiquity subjected to "a dry light" in which imagination was no element are forgotten. This is the more remarkable because WINCKELMANN, who was much indebted to him, is assumed to have been the true revealer of antiquity and art to the people of modern Europe. The German Abbé was not more enthusiastic about art than the French nobleman, and he was far more unreasonable in his conclusions. But in one case the errors were expressed in words more or less vague, while CAYLUS, who never was wanting in courage, expressed conclusions by his own designs, which are not comparable with FLAXMAN'S. It was through his draughtsmanship that CAYLUS'S reputation is so insignificant, but, after all, his indirect influence on the future may not be less than that of his rival.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last at Conduit Street, W., Professor Aitchison, R.A., president, in the chair.

The Hon. Secretary announced the decease of the two following members who were Associates:—Frederick Mew, elected 1859, and William Reddall, elected 1874.

Mr. John Bilson read a paper, illustrated by many lantern slides, on

The Beginnings of Gothic Architecture: Norman Vaulting in England.

By way of preface to his subject Mr. Bilson contributed a paper in a recent number of the Institute "Journal," in which he reviewed some modern investigations of French archæologists into the origin and development of Gothic architecture. The following were the principal works referred to:—"L'Architecture religieuse dans l'ancien Diocèse de Soissons au XI^e^ et au XII^e^ Siècle," by E. Lefèvre-Pontalis; "L'Art gothique," by Louis Gonse; "La Transition," by Anthyme Saint-Paul, in the *Revue de l'Art Chrétien*; "Monumens religieux de l'Architecture romane et de Transition dans la Région picarde," by C. Enlart; and "Die Anfänge des gothischen Baustils; zur Kritik des gegenwärtigen Standes der Frage," by G. Dehio, in the *Repertorium für Kunstwissenschaft*. The author commended these researches to the attention of English students still prone to accept as final the judgments of earlier writers, such as Viollet-le-Duc, some of which have been found untenable in the light of more recent inquiry. Mr. Bilson stated that in his prefatory paper he had made free use of Herr Dehio's masterly treatise, the general conclusions of which must, in the main, eventually win acceptance even among the younger French school of inquirers.

In opening his paper on "Norman Vaulting in England" the author touched upon the development of Norman Romanesque resulting from the revival of architecture in Normandy early in the eleventh century, and noted some of its most striking characteristics. Available literary evidence tends to show that some of the Norman methods were already in use in England before the Conquest, but we are not justified in believing that the design of these English buildings was marked by the logical precision so characteristic of Norman work, or that the English had taken any step in the direction of vaulting over their churches.

In studying the development of vaulting, as illustrated by English examples between the Norman Conquest and the middle of the twelfth century, the author dealt first with the vaults of the lower parts of churches, such as aisles and crypts, citing existing examples of the various forms described.

The ground vault in its simplest form results from the intersection of two semi-cylindrical vaults at right angles to one another—a survival, in fact, of the Roman groined vault. Generally, however, these ground vaults are banded by semi-circular transverse arches or "doubleaux," usually of simple square section, and forming a kind of permanent centering. The adoption of these doubleaux, however, involved considerable inconvenience in the construction of the springing of the groin. In the Roman groined vault and its imitations the groin springs from the external angle of the pier or pilaster. In many of the early Norman vaults the groin springs either from the internal angle formed by the junction of the transverse arch at its springing with the wall-face, or from the face of the wall or arch close to the angle. As the vaults were constructed of rubble masonry with thick joints and covered with plaster, this method of springing the groin was obviously defective as a matter of construction. Consequently we find the difficulty met at a very early date by a further development in the membering of the supporting pier; the pilaster which carries the transverse arch is flanked on each side by a secondary pilaster, which affords an independent support for the groin. In some crypts where the vaulting is supported by single cylindrical shafts the springing of the vault is subdivided in a similar manner, so as to give a separate projection for the springing of the groin. A further advance consisted in the substitution of a shaft for the square pilaster which supported the groin. At Saint-Etienne, Caen, and at Winchester Cathedral, an improvement is found in the construction of certain of the vaults. The haunches of the vault for a short distance above the springing are constructed of ashlar, above which the vault is of rubble, plastered.

Having described the modification the simple groined vault underwent when necessitated by the oblong or irregular plan of the bays to be vaulted, the author passed to his main subject, the ribbed vault. Wherever it originated, or whatever the circumstances under which it was evolved, the advantage gained by the introduction of the rib was obvious. It afforded a permanent centering for the groin, the weakness of which in vaults over wide spans must always have rendered them liable to failure. It completed the membering of the vault which had commenced when the transverse arch was added to the Roman groined vault. The new expedient was readily adopted and rapidly developed by the Normans, in England as well as in Normandy.

The cathedral church of Durham is the most complete early example of the adoption of the ribbed vault in England. Contemporary chroniclers record that every part of the church was covered with ribbed vaulting between 1093 and 1133. The plan of the choir and east side of the transepts shows that it was the intention from the first to cover both the aisles and the main spans with the vaults which were actually constructed. The aisle vaults of choir and transepts (the various features of which were described in detail by the author), constructed under Bishop William between 1093 and 1096, are clearly part of the original work; masonry and mouldings correspond in character with those of the choir arcades, and for constructional reasons the aisle vaults must, as usual, have been erected along with the main walls. The vaults of the nave aisles, the characteristics of which were next discussed, are the work of Bishop Ralph Flambard (1099-1128); and as he completed the nave as far as the high vault, the aisle vaults may safely be attributed to the first decade of the twelfth century. They correspond in character with the aisle vaults of choir and transepts, except in a few minor points.

The next dated example of ribbed vaulting is to be found in the reconstructed parts of the transepts of Winchester Cathedral. The original work in these transepts belongs to the church which Bishop Walkelin commenced in 1079, and which the monks entered in 1093. The works of reconstruction necessitated by the fall of the cathedral tower in 1107 are easily distinguishable from the original work by the different thickness of the masonry joints. The date of these ribbed vaults may be put within two or three years after the tower fell.

Peterborough Cathedral presents examples of ribbed vaults, the date of which is proved by documentary evidence. The earlier church was destroyed by fire in 1116, and the present building was commenced in 1117 or 1118. In 1140 or 1143 the monks entered the new church. The parts then completed include the choir and east side of the transepts (except, perhaps, the clerestories). The aisles of choir and transepts throughout are covered with ribbed vaults, the distinctive features of which the author described.

The paper then went on to discuss M. Félix de Verneilh's conclusions with regard to the Peterborough vaults, on which M. Lefèvre-Pontalis based his statement that the ribs were added afterwards in the second half of the twelfth century. M. de Verneilh's theory was that the supporting shafts were designed to receive the projecting groins of unribbed vaults, and that the actual ribs were added afterwards. In the recent taking down and rebuilding of the central tower, however, no evidence whatever was found to support this theory. It is

clear that these Peterborough vaults are original, from the fact that they do not stand alone, but are analogous in their method and construction to a large number of vaults which cannot all be the result of such an alteration as M. de Verneilh suggested.

The author then passed to the consideration of examples of similar ribbed vaults, to which, in default of documentary evidence, approximate dates only can be assigned from the character of the work. The following examples were discussed:—The vaulting over the north aisle of the nave of Gloucester Cathedral, which may be safely assigned to the first twenty years of the twelfth century; Avening Church, Gloucestershire, ribbed vaults, *c.* 1120-1130; Southwell Minster, the aisles of the nave of which are covered with ribbed vaults, *c.* 1120; the Priory Church of Lindisfarne, built by Ædward (who died, probably, near the end of Ralph Flambard's Episcopate, 1128)—this church throughout was covered with ribbed vaults, and its design is evidently inspired by Durham; the nave of the abbey church of Dunfermline, also inspired by Durham, probably erected soon after the accession of David I. (1124); Selby abbey church, whose eastern bays of the nave also afford marked indications of Durham influence; Romsey abbey church, vaults of choir aisles, and the church at Lessay, Normandy—examples interesting as showing how the idea of the ribbed vault was introduced, during the course of construction, in works originally planned only for unribbed vaults; the two churches at Devizes, Wiltshire, affording examples of aisleless chancels covered with ribbed vaults, and to be attributed, with some probability, to the architectural influence of Bishop Roger of Salisbury, and dated approximately *c.* 1125-1130, St. John's being slightly earlier than St. Mary's.

The difficulties which confronted the builders of these early ribbed vaults, so long as they employed only semicircular or semi-elliptical curves for the ribs, were entirely surmounted by the adoption of the pointed arch for the doubleaux. The nave aisles of Malmesbury abbey church have been frequently quoted as the earliest example in England of this new method of construction, and have been attributed to Bishop Roger of Salisbury; it is scarcely probable, however, that the rebuilding of the church was commenced before the bishop's death in 1139; it must, nevertheless, have closely followed that event, and the existing nave cannot be assigned to a later date than the middle of the twelfth century. There is no evidence whatever to support Mr. C. H. Moore's assertion that the vaulting is an imitation of French work. The style of Malmesbury is purely Anglo-Norman, and shows no trace of the influence of such French work as the chapel of Bellefontaine and St. Denis. At the same time the Malmesbury aisle-vaults bring us to the threshold of the complete Gothic vaulting system, and almost to the time when French influence undoubtedly began to affect English work.

In treating of the vaults over the principal spans of churches, the author said that the Normans aimed at covering all parts with stone vaults. The plans of piers sufficiently indicate that the vaulting of the principal spans was intended to follow the vaulting of the aisles. The choir-piers of St. Nicolas, Caen, and St. Georges de Bosherville were cited as typical examples. Each shows a group of three shafts on each side of the pier to carry the arch-orders of the main arcades, a single shaft which receives the transverse arch of the unribbed side vault, and a corresponding shaft towards the main span. It is not improbable that the failure which naturally attended the construction of the earliest vaults over wide spans may in some cases have rendered subsequent reconstruction a necessity. Very few early examples of vaults over wide spans have survived. The earliest instance in England of a ribbed vault over the principal span of a great church is the choir vault of Durham Cathedral, though here the original vault was replaced by the existing vault in the fifteenth century. The vault over the north transept of Durham is probably the earliest of such vaults still existing. The evidence of the structure itself, the analogy of the other vaults of the church, and the documentary evidence, taken together, enable one to speak with some approach to certainty of the character and date of the original choir vault of Durham. The plan of the choir, consisting of two double bays, is a type usually associated with a sexpartite vault. But the date is much too early for this kind of vaulting. There can be no doubt that the original choir vault was a ribbed vault, and it may safely be concluded that the choir was originally covered with a double quadripartite vault over each double bay, closely resembling the vault of the north transept, erected almost immediately afterwards.

The vaults of transepts and nave at Durham next came under examination, and were discussed at length, the author showing that the character of the work indicated that the vaulting idea was present in the earlier parts of the structure, and that it was abandoned and again taken up while the work was still in progress. Touching the date of the nave vault of Durham, there is absolutely no authority for Billings's statement, repeated by later writers, that it was constructed between 1233 and 1244 in the Norman style. Symeon's continuator proves that the nave was vaulted between 1128 and 1133 and this is borne out by the character of the masonry of the vault itself.

Durham affords complete proof of the ability of Norman builders to construct ribbed vaults over the principal spans of a great church, and to abut the thrust of these vaults by arches across the triforium, of which the flying buttress is merely a development. Evidences quoted by the author indicate that the choir vault was constructed by 1104; the vault of the north transept may be assigned to a date within the first decade of the twelfth century, and that of the south transept within the first quarter of the century; while the nave vault, with its pointed transverse arches, was constructed between 1128 and 1133. Examples of vaults showing the influence of Durham were cited in the priory church of Lindisfarne, no part of which appears to be later than the middle of the twelfth century, and, on a small scale, Warkworth Church (Northumberland).

The nave of Lincoln was vaulted before the middle of the twelfth century. It was built by Remigius, and dedicated in 1092, was injured by fire in 1141, and Giraldus Cambrensis states that it was vaulted by Bishop Alexander. Henry of Huntingdon places the date of this work at 1146. What this vault was like may be gathered from the chancel of Stow Church, Lincolnshire, the detail of which so closely resembles Alexander's work at Lincoln as to prove that it was executed by the same school of masons. The evidence here indicates that Alexander's nave-vault at Lincoln must have been ribbed.

The following early examples of ribbed vaults to apses were referred to, and their characteristics described—the small apsidal chapel on the east side of the south transept of Christchurch, Hants, appearing to date from early in the twelfth century; the apsidal chapel on the east side of the south transept of Tewkesbury abbey church, which may be assigned to the first twenty years of the twelfth century; Birkin Church, Yorkshire, middle of the twelfth century; the octopartite vault of the treasury of Canterbury Cathedral; the apse vault of the chapter-house of Durham Cathedral, a larger and more advanced example, finished by Bishop Geoffrey Rufus, 1113-1140. The last-named was partly destroyed by fire in 1796, but Carter's drawings have preserved an accurate record of it.

The author concluded his paper with some observations on the bearing of the English evidence on the general question discussed in the prefatory paper above referred to. Before the introduction of the rib, the Normans were already developing the articulation of their construction to an extent quite unknown in the Ile-de-France. The earliest ribbed vaults exhibit a system which is slightly less advanced than even the primitive vaults over the aisles of Saint-Etienne, Beauvais. The large number of ribbed vaults still remaining proves the existence of an active school, which had already accomplished much before the introduction of the pointed arch. It is remarkable that all these English vaults are quadripartite. No example is met with either of the sexpartite vault or of the intermediate form — quadripartite cut by a secondary transverse rib — both of which occur in the group of churches in and around Caen. Obviously the quadripartite vault was the earliest form, and varieties could not have been developed if the quadripartite vault had not previously been known. The evidence of the rib sections points in the same direction. As in their system, so also in the profiles of the rib mouldings, the earlier ribbed vaults in England come into line with the quadripartite vaults at Lessay, and represent an earlier stage than the vaults of the Caen group. These latter, whether sexpartite or of the intermediate form, show one easily recognisedtype of rib section, a more refined and clearly later type, not found in England until the octopartite vault over the Treasury at Canterbury Cathedral, probably erected soon after 1130. The approximate date of 1130 suggested for the earliest vaults of the Caen group seems probable enough, and the experiments which the builder of these vaults tried in setting out the curves of the ribs indicate that they were not adopting ready-made a system already worked out elsewhere. Apart from the English evidence, the authenticated dates of the earliest ribbed vaults prove that influence from the Ile-de-France is quite impossible, and show the complete independence of the Norman school up to, at any rate, the end of the first third of the twelfth century.

Mr. Rhenè Spiers, who proposed a vote of thanks to the author of the paper, said there were some features in the buildings in Normandy which would prove them to be of later date than the English examples. The character of the carving, to would support this theory. As Mr. Bilson had precisely left out those portions of his paper which dealt with the example in Normandy, and on which he (the speaker) could say a few words, he dare not presume to criticise the paper at great length.

Mr. Francis Bond, M.A., seconded the vote, which was supported by Messrs. W. H. St. John Hope and E. W. Hudson.

Mr. Bilson briefly replied.

Thackeray's House (No. 16 Young Street, Kensington) was sold on Tuesday by auction for 3,350*l.*

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.

THE monthly meeting of the Society was held at the School of Art on the 14th inst. There were present Mr. J. Smith, vice-president, in the chair, Mr. C. Hadfield, Mr. E. M. Gibbs, Mr. C. J. Innocent, Mr. Thomas Winder, Mr. Hadfield, junr., Mr. Innocent, junr., Mr. Tether, and others. Apologies for absence were received from Messrs. R. W. Fowler (president) and William C. Fenton (hon. secretary). Five gentlemen were nominated for membership, and will be balloted for at the next meeting. Messrs. E. Winder, junr., and C. M. Hadfield were elected auditors.

Mr. E. Prioleau Warren, then gave a lecture on the subject "Theory, Practice and Tradition." He said the value of theories in the training of students of architecture is twofold. Theories provide an excellent mental exercise and incitement to study; and such of them as are of approved authenticity, logical quality and obvious derivation from experience pass into tradition, become axiomatic, and form part of the necessary groundwork of all architectural training. They are practically statements of first principles, and should form the initial exercises of the student. They are, to use a military parallel, the exercises of the drill ground, and the preliminary essentials of future and more extended manœuvres. The appliance of first principles must, to be really useful, become instinctive, almost unconscious, and is never more valuable than in the critical consideration of architecture, old or new. A sound theory, soundly remembered and applied, is an admirable corrective of appreciation or depreciation too thoughtlessly bestowed. Few things, after the prime necessities of trained imagination and constructive instinct, can be of more importance to an architect than the discriminating, the critical faculty, and it could never have been of greater importance than to-day. We have inherited the legacy of nigh upon a century of architectural unrest; we are beset by such a profusion of conflicting literature; we have reached such a chaos of conflicting styles, tastes, ideas and examples, that the course of the student is a maze of confusion. He needs the moral compass of trained discrimination, with its needle of principle ever veering to the north point of truth; provided with this, he can afford to make a few experimental divagations—he can always recover his true direction. It is often said that the profession of an architect is a modern one; it appears to be understood that he has evolved himself, has created his profession and its modern condition, as they stand. That is an impossible view. The evolution was gradual, and very clearly traceable from the Mediæval master-builder upwards. The Renaissance brought new and foreign ideas and forms, and with them the need of a trained interpreter, a man of education. Inigo Jones, Wren and Chambers all were interpreters. The architect has to supply the imaginative element that makes building architecture; he is rendered necessary by the inability of the working builder to originate and organise comprehensive schemes. The difficulties of producing real architecture under modern conditions are great and complex. Commercialism is against us; the rush and hurry of the age are against us; and perhaps our worst obstruction is the almost absolute lack of real sympathy with architectural ideals, the extreme paucity of educated taste which we meet with in our patrons, and our public traditions are broken, and have to be revived or created afresh. The enormous help and value of strong tradition, the immense benefit of a real vernacular expression in architecture, are abundantly apparent to those of us who carefully study the past, who read between the lines of architectural history, and who are struggling to apply true principles under exasperatingly antagonistic conditions. There is, however, hope for the future; we seem to have done with revivals, with mere copying of a dead past. Our danger in that respect lies in a too violent tendency in the opposite direction, the exaggerated swing of the pendulum, the eccentricities of architectural revolt. We do now, at any rate, upon the whole build, in the technical sense, well; better, indeed, than the last four centuries built in England. We have to see to it that, building soundly, we also build beautifully.

On the motion of Mr. Hadfield, seconded by Mr. E. M. Gibbs, and supported by Messrs. Mitchell-Withers and Smith, a vote of thanks was accorded to the lecturer, and the meeting closed.

Mr. G. F. Watts, R.A., has offered to erect entirely at his own expense a covered way in the churchyard of St. Botolph, Aldersgate, in which to place tablets illustrating heroism in everyday life; while Mr. Sigismund Goetz has offered his figure of the Dead Christ, exhibited last year at the Royal Academy under the title of "Eloquent Silence," for the decoration of the church at the east end. Two other paintings will represent the motto "Watch and Pray."

THE PALACE AT PERSEPOLIS.

THE Museum of Science and Art has been presented by Major-General Sir R. Murdoch Smith with several fragments recovered from the palace of King Darius Hystaspes. These objects, although few in number, are of rare interest to the archæologist, belonging as they do to an early epoch in Persian history, recorded by classical writers, and alluded to in several passages of sacred writ.

The relics consist, says the *Scotsman*, of detached portions in sculptured limestone, taken from the débris at the site of the ancient structure, and comprise:—A portion of a frieze, sculptured in relief, with the leg and cloven foot of a bull, having a band of rosettes underneath. The sacred bull of Persia was called "aboudad," and generally regarded as an emblem of the creative power of God, in which existed the germs of all being—as, further, that of royalty—the horns being indicative of strength and force. The rosette was a favourite ornamentation with both Persians and Assyrians, and besides adorning the sculptures is found engraved on bracelets, wristlets, and armlets, as well as portrayed on the dresses of their sovereigns. This sculpture displays much anatomical skill in its execution. A fragment from the base of a columnar pillar, sculptured with curved beaded mouldings, enclosing tastefully designed leaves of the hallowed lotus—some of the latter being rounded and some narrowed to a point; the foot of a lion, of some size, carved with a wonderful fidelity, which no doubt formed part of a bas-relief representing this animal encountering a bull, placed within the compartment beneath the spandrels which fenced one of the staircases or approaches to the palace, symbolising thereby Mithras encountering Ahriman, the "evil principle," or the God of Light contending with the Demon of Darkness—for Mithras, as a solar divinity, was usually depicted with a lion's head; a fragment sculptured with a band of rosettes tastefully grouped; and lastly, a portion of a crenelated ornamentation, which evidently at one time adorned one of the square-topped niches or doorways of the royal palace. The sculpturings on these vestiges are surprisingly delicate and chaste, and convey to us interesting exemplars of some of the most characteristic features of the old Persepolitan art. Unfortunately, however, there are no traces of inscriptions to be found on any of these fragments.

The palace of Darius—which was one of the greatest of his works—was a building of 130 feet in length, and in breadth a little short of 100 feet. It was of rare magnificence, being constructed of black stone and partly of marble cut into gigantic blocks, and in many cases exquisitely polished. Placed upon the summit of an exalted platform of 1,430 feet by 802 feet wide, it was approached by a double staircase cut in the rock, leading up to a portico of eight pillars, ranged in two rows on either side, behind which lay the main chamber, having a roof sustained by sixteen pillars placed in four rows of four. Walls of 4 to 5 feet in thickness surrounded a grand hall, in which were windows and doors symmetrically arranged. The entire area of the palace was a little more than 13,000 feet, while that of the hall—which was crowded with pillars—was about 2,500 feet. This noble edifice was said to have been constructed by 6,000 Egyptian workmen whom Cambyses transported to Asia. The structure remained the wonder of the Eastern world until the invasion of Persia by Alexander the Great (B.C. 356), who after capturing the city of Persepolis, and becoming there degraded in judgment by his multitudinous successes, during a fit of intoxication set the palace on fire, as some suppose, as a just retaliation for the devastations Persia had in previous years committed in Greece. But, as is now believed, the building was not then wholly destroyed, but subsequently so by the fanatical Arabs in Mohammedan times.

Darius—whose native name was Daraywaush—was the son of Hystaspes, a governor of Persia proper. He was a prince of royal blood, of the family of the Achæmenidæ, or native Persian kings, and ascended the throne B.C. 521, after his murder of the Magian Gomates, the pseudo-Smerdis, who had given himself out to be Bardis, the brother of King Cambyses. For six-and-thirty years he swayed the destinies of the kingdom, being afterwards succeeded by Xerxes, or Khisharsatha, now identified with the Ahasuerus of Esther. Next to Cyrus, Darius was the greatest of the Persian kings, and to him the empire owed its organisation. His kingdom extended from the Ægean to the Indus, and from the steppes of Scythia to the cataracts of the Nile.

Persepolis, or "the Persian city"—for Persia was called Paras in the Hebrew, and Parsa in the native inscriptions—was situated in the plain of Mardusht, about thirty-five miles north-east of Shiraz, on the highway to Ispahan. It was one of the four cities of Cyrus, and for a considerable period remained the capital of the Achæmenian dynasty of Persia.

Several of our commentators surmise that the decree of Darius—enforcing the previous firman of Cyrus granting permission to the Jews to rebuild their temple at Jerusalem—emanated from his royal palace at Persepolis, but we are not yet in possession of sufficient data to support this.

NOTES AND COMMENTS.

One day we suppose an effort will be made to secure as public property the house at Herne Hill where Mr. Ruskin spent a part of his boyhood. He has repeatedly mentioned it with affection. "The little domain," he said, "answered every purpose of Paradise to me, and the climate in that cycle of years allowed me to pass most of my life in it." The orchard he describes as splendid in colour; "fresh green, soft amber and rough-bristled crimson bending the spinous branches, and clustered pearl and pendant ruby joyfully discoverable under the large leaves that looked like vine." The house with three others, being part of the property of Lady Nottage, was sold on Monday for 7,600*l*. It appears that Mr. Ruskin's father bought a lease of the house in 1823. Seventeen years afterwards the family moved to the Denmark Hill house, adjoining the residence of the late Sir Henry Bessemer. In 1871 the Herne Hill house was given to Mrs. Arthur Severn by Mr. Ruskin for the remainder of his lease, which expired in 1886, and then Mr. Arthur Severn renewed it for twenty-one years with Lady Nottage, who became possessor of the property. Mr. Ruskin still holds the house in affection; when in London it becomes his home, and he occupies his old nursery as his bedroom.

Some time back there was talk about selling the Hôtel de Lauzun on the Quai d'Anjou, which lies eastward of Notre-Dame. That part of Paris has changed its character, or at least it is no longer esteemed at its old value, but the mansion is one of the finest survivals of the houses which were considered requisite to uphold the state of a grandee in the time of Louis XIV. The decorations, ceiling paintings and woodwork are of great beauty, and have been coveted by the conservators of many foreign museums. The sale of the property did not take place at the time announced. It is still in the market. The Municipal Council of Paris have lately considered whether it would be desirable to purchase the Hôtel de Lauzun, and it appears there is almost unanimity about the advantages of possessing so famous a building, to which interest attaches by its having been a residence for aristocrats. In a later time, when it was let out as appartements, Baudelaire the poet and Théophile Gautier were among the tenants.

Anyone who expects to find some hundreds of masterpieces in the exhibition of the Royal Institute of Painters in Water-Colours is sure to be disappointed. Works of that class are not now to be found in a collection where so many drawings are priced at 10 guineas and under. If tested by the usual standard of the Institute, the exhibition is of more than average interest. We have occasionally seen better works in the Piccadilly galleries, but we have also seen in former exhibitions many that were inferior to those which are now hung. There is no surprising example of inventive power, the subjects of the figure drawings are generally familiar, and there is no revelation of any nook of earth that was not hitherto explored and represented. It cannot be otherwise. Water-colour drawing has its limitations, and when six or seven hundred efforts are made every year to put before us the earth's surface and several classes of those who live upon it, there must be eventual exhaustion of novelty. The majority of visitors to exhibitions expect to be surprised by the subjects of pictures. They care less for treatment, and drawings which a Frenchman would closely scrutinise are passed by without a glance in London galleries. In the Institute exhibition there is enough satisfactory work to gratify visitors, especially those who can realise there are a variety of tastes and that all artists are not bound to satisfy a few individuals.

The eulogium of Leonardo da Vinci by Hallam is well known. In the course of it he said that "the discoveries which made Galileo and Kepler, and Maestlin, and Maurolycus and Castelli, and other names illustrious, the system of Copernicus, the very theories of recent geologers, are anticipated by Da Vinci. . . . He first laid down the grand principle of Bacon that experiment and observation must be the guides to just theory in the investigation of nature." Much has been discovered since Hallam wrote to prove that in much else Da Vinci was in advance of his age. A paper by Herr Müller-Walde has just appeared in one of the official Prussian year books which proves that Da Vinci had anticipated the submarine boat on which France now relies for obtaining the sovereignty of the ocean. In manuscripts in Milan and elsewhere Herr Müller-Walde found not only descriptions but diagrams of the invention. Ships in the fifteenth century were constructed of wood, and could be more easily destroyed than vessels formed of steel plates, but the power of projectiles has also increased. It may be said that Da Vinci, when treating such subjects, was no more than an early Jules Verne, but his contemporaries believed in his practical skill. A marble saw he invented is still in use in the Carrara quarries. It is proposed to translate Da Vinci's scheme of submarine warfare.

The Secretary for India has appointed a former student of the Birmingham School of Art, Mr. Percy Brown, as principal of the Mayo School of Art, Lahore. The office was held by Mr. J. R. Kipling, C.I.E., the father of the poet and novelist, for no less than nineteen years. All the students of the Mayo School are natives. There are 300 students at Lahore, and 200 at each of the three branch schools at Amritsar, Ludhiana and Delhi. In addition to teaching the subjects usually taught in English art schools, the principal of the Mayo School has to devote special attention to plaster and wood decoration, for which the Punjaub is famous. Further he is regularly consulted by the heads of the native guilds of handicraft, and thus is enabled to exercise great influence upon the artistic work of the Punjaub—an influence which should be wisely used in accordance, not with European, but with Indian traditions. Mr. Boyd's experience has been varied. In 1885 he entered the Birmingham School. In 1892 he entered the Royal College of Art as an exhibitioner. He subsequently worked under the Egypt Exploration Fund at Luxor and in Middle Egypt. He afterwards visited Greece, Turkey and Italy. Later, he returned to the Royal College of Art, where he completed three groups of the Art Master's Certificate, and also assisted in teaching. Since January 1898 Mr. Brown has taught classes at the central and branch schools of the Birmingham Municipal School of Art.

The Government of New South Wales are acting right in endeavouring to facilitate visits to the series of remarkable caves in the colony. For some years past complaint has been made of the accommodation for visitors at the Jenolan caves. Arrangements were therefore made to resume the premises forming the old accommodation house. The Government architect was authorised to prepare designs for a new building. One wing of a new structure has been completed. It has an imposing and picturesque appearance. It is solidly built of limestone, and contains ample accommodation. The dining-room is capable of seating sixty guests. For the recreation of visitors a detached billiard and smoking-room has been erected. It is proposed to let the premises by tender, and it is hoped that visitors will shortly find themselves as comfortably provided for as if at home. In other directions no trouble has been spared to add to the attractions and conveniences of the Jenolan caves. The Public Works Department has completed on the main road leading to the caves house one of the most beautiful little bridges in the colony, built of limestone. Many improvements have been carried out in the caves themselves. New entrances have been constructed where access was not easy. The director of the Botanic Gardens has been invited to remodel the plantations and to terrace and plant the slopes surrounding the accommodation house.

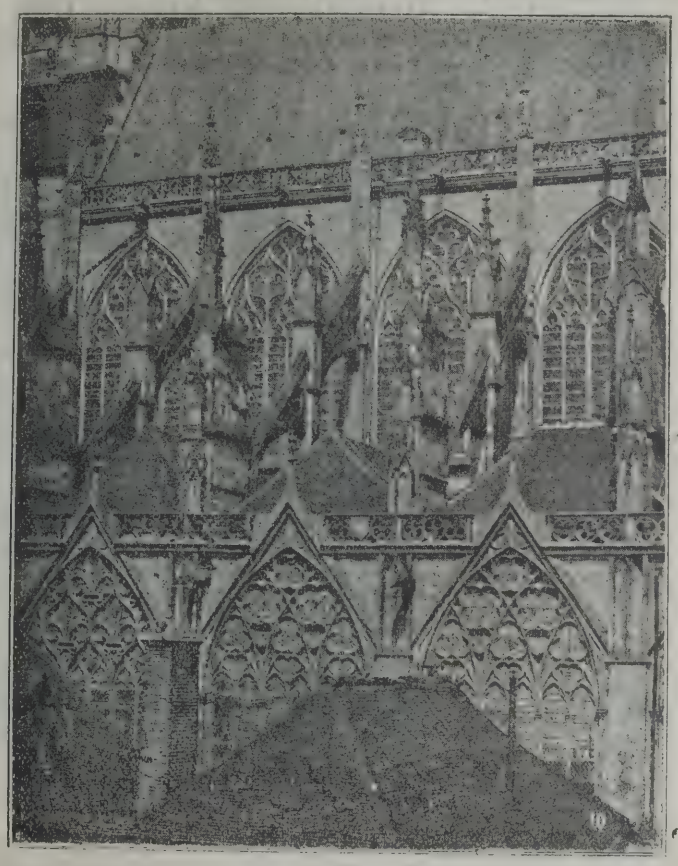
Troyes.

XIV.



RETURNING to the hotel for my knapsack I find a little omnibus waiting to convey me to the St. Florentin (Est) on, whence a line had but recently been opened to Troyes, fied to by the gravelly platform and air of stickiness ading everything.

As this vehicle, whose services I am glad to avail myself of, t is very dusty and hot, approaches the station, it overtakes priests tramping along the shadeless road, each armed his Breviary and an umbrella of Gamp-like aspect, and ng clouds of dust at every step.

In the booking-office the clerk is enjoying a siesta, and reverences, to attract his attention, knock loudly at the et unopened pigeon-hole with franc-pieces. However, after

TROYES: ST. JEAN, FROM NORTH-EAST.

TROYES CATHEDRAL: PORTION OF SOUTH SIDE.

lapse of some minutes we are all furnished with the ssary permits for the voyage, and, according to the ulous custom of the country, which I am glad to see is me places becoming relaxed, are penned up in the *salle ente*. The train for Troyes comes puffing in; the priests some half-dozen market people make a frantic rush for the ages as soon as the glass doors are thrown open; a great ness is made of nipping our tickets, and St. Florentin pears from view.

With the exception of a few country people, who get in at station and out at another, staring during their sojourn in arriage at my English touring suit in open-eyed amaze-, but who give me a pleasant "Merci, monsieur! Bon et bon voyage!" as I assist them in or out with their ets, the train picks up but few passengers. The line is a uninteresting one, presenting nothing but a succession of l villages with churches of a nondescript character; these, ever, serve in some degree to break the monotony of the ey from St. Florentin to Troyes, into which the train runs laudable punctuality at two o'clock. Lying as it does in a dead level, the appearance of the old capital of Champagne from the railway is somewhat disappointing, for although it is stocked with churches not one has any steeple of sufficient magnitude to indicate the treasures of ecclesiastical art lying within.

As we pass out at the station door a gendarme looks narrowly at every package as though it were an infernal machine, lifts the cloth from every market basket, and even peeps under my travelling library.

It is hot, very hot. Right glad am I, after securing quarters at the excellent Hôtel des Courriers, close to "the most enchanting spectacle which the genius of man has bequeathed to the admiration of successive ages"—the church of St. Urbain—to escape from the heat and glare into the cool cathedral, its mighty valves, thrown back to their utmost width, and revealing stained-glass windows whose rubies and sapphires shimmer in the gloom "like silver lamps in a distant shrine."

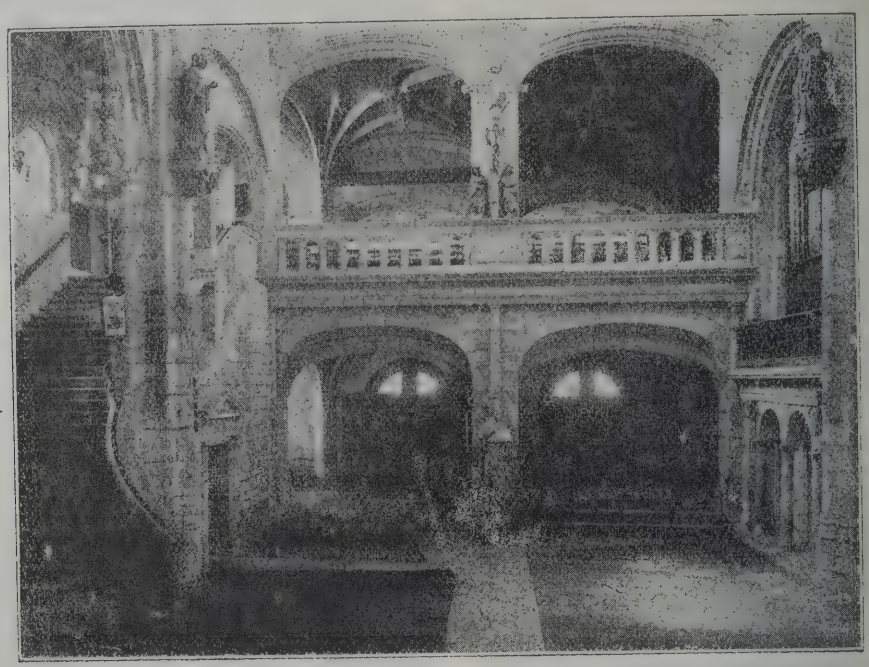
To wake up at six o'clock on Sunday morning in one of the large airy bedrooms of the Hôtel des Courriers and to see glorious Old Sol tinging the peaks of some antique gables opposite is truly delightful. But this is nothing compared with the subsequent pleasure of inhaling the sweet air of early morning as it is wafted through streets of old timbered houses from the vast tract of environing country, or while threading the mazes of that most delightful of lounges, a French flower market. Thus, interspersed with an occasional dive into a church or two, where the white chasubled priest moves softly to and fro before the altar in the stillness of the early morning Mass, the time glides most delightfully away.

The Troyes churches cluster almost as thickly as those in Cologne. If not of the highest order architecturally, being chiefly in a very bold Flamboyant style peculiar to this district of Champagne, they have contrived to retain a good deal of their seventeenth-century furniture, and the picturesqueness imparted to many of them by their high open-backed benches is quite refreshing after the Parisian smartness which is the besetting sin of too many great French churches. Not a few are rich in Late stained-glass.

In succession I visit St. Jean, remarkable not only for its lofty clerestoried choir of pointed windows filled with Renaissance tracery—a choir rising clear above the houses which, like the snails at Mrs. Pipchin's, cling with the tenacity

of cupping-glasses to places they are not expected to ornament —but for its altar-piece. This is embellished with the painting by Mignard, a native artist, of Our Saviour's Baptism, usually kept veiled, but to-day, being Dies Dominica, disclosed for the veneration of the faithful.

St. Nizier, St. Remi, St. Pantaleon and La Madeleine, before whose unique early sixteenth-century rood-loft—"a curtain of lace cut in marble"—I spend some time wrapt in admiration, all in some point or another challenge the attention. Unsupported by pillars, the author of this marvellous jubé rests beneath it, "sans craindre d'être écrasé."



The transepts and short nave of the Madeleine are very early First Pointed, but not very good exemplifications of that style.

At length I stand before St. Urbain's, its gracefully contoured Middle Pointed apse, profiled against a sky of purest cobalt. Eagerly I pass through the portals, and the impression of the early morning sun streaming through the storied panes of the lantern-like apse, throwing the choicest hues upon the surrounding stonework, is one which can never be effaced from the tablets of memory. Upon this occasion St. Urbain's fairly earns the eulogium passed upon it by one whose name is, I trust, not wholly forgotten in the history of architectural literature.* "For a building of its size, it is the most enchanting architectural spectacle which the genius of man has bequeathed to the admiration of successive ages."

Halberstadt and Erfurt a reminiscence of German when vi ing its tall aisleless apse, due presumably to the vicinag this part of Champagne to Teutonic soil? Several of Châlons and Toul churches exhibit similar Germanisms. Dijon, too, if memory serves aright, the apses of the churc are aisleless.

But it is time to return to the Hôtel des Courriers and p take of a *petit premier déjeuner* before returning to the ca dral to assist at the matutinal offices. The repast conclud I repair thither, and am bound to confess I am grievo disappointed in the great western façade, having formed, a turns out, an exaggerated idea of its Flamboyant gorgeousn from a drawing in Arnaud's "Voyage dans le Départemen l'Aube," for in common with too many other productions of same school it bears a painfully unfinished aspect—*ouvr en appliqué* of the most voluptuous character contrasting v disagreeably with patches of wall-space absolutely bald: the north-west tower is insipid in a degree.

But the interior—albeit the thirteenth-century choir, wh abounds in the most exquisite detail, lacks the expansion dignity characteristic of Amiens, Chartres and Rheims fairly entitled to the praise bestowed upon it by Bourasse his "Cathédrales de France," on account of its wealth of co painted glass, which fills not only the windows of the cl whose Geometrical tracery is so thin that it seems merel form a framework for keeping it in its place, but the Early

TROYES: WEST END OF ST. PANTALEON.

Begun in 1262 by Pope Urban IV., son of a shoemaker of Troyes, on the site of his father's workshop, this graceful church for more than 600 years remained but a fragment,† consisting only of a choir and transepts, "thanks to some contumacious nuns who had sufficient power and influence, even in those days, to thwart the designs of the Pope himself." It is in its details that the beauty of St. Urbain resides, its chief defect being "a certain exaggerated temerity of construction which shows how fast, even then, architecture was passing from the hands of the true artist into those of the mason, whose attempts to astonish by wonders of construction, then and ever afterwards, completely marred the progress of the art which was thought to be thereby promoted" (Fergusson).

"Le plan de l'église de St. Urbain est champenois," says M. Viollet-le-Duc; but is there not to those conversant with the great "Hallenkirchen" of such cities as Münster, Soest,

Late Decorated ones of the nave aisles and clerestory, former of which the fleur-de-lys forms an interesting feat may be seen from the accompanying illustration. Troy round its procession path five hexagonally apsidal ca with lancet windows, and is one of the few great churches planned with double aisles to both nave and In the latter, however, these double aisles are coextensi with the first three bays, after which the internal one a prolonged round the apse. The nave and its doublea have magnificent groups of clustered shafts, with those m chiselled capitals characteristic of the Later Decorated and in several points bear a resemblance to those on th side of the nave at Worcester. While the matutinal c Tierce is being chanted *senza organo* in the choir, about these glorious aisles at Troyes, and dwell upon th nificent painted glass which enriches them.

During the progress of the office above-mentioned, begin to arrive for "La Grande Messe de dix heures." are, as usual in French churches, in the ascendant. "M est catholique, mais il ne pratique pas." What a cona Germany, with the naves of the churches of Colo Münster or Cleve or Xanten or Paderborn cram

* Thos. Inkersley (*Romanesque and Pointed Architecture in France:* 1850). A work exhibiting much thought and research, but from whose usefulness the absence of pagination and index sorely detracts.

† At the time of my visit to Troyes the erection of the nave was being rapidly proceeded with, and must, ere now, be completed.

ation at the midday *Sing Amt.* As I take my in one of an empty collection of chairs, very at my service, a bell tinkles. The six great candles he high altar are lighted, the organ in the choir the intonation, and to its never-wearying plain song ly the *Asperges me Domine* is chanted, as the officiant whom the duty devolves bears the holy water down the attended by a little flaxen-haired acolyte in crimson ck and lace-edged cotta. Again the bell tinkles. The organ at the west end flourishes in the key of E minor. cifix, flanked by a pair of candles, gleams in the dusky ern choir aisle, and in honour of St. Loup—whose festival ng kept in Troyes to-day, whereas in our Anglo-Catholic dar it is appropriated to the Holy Name—a procession s round the choir chanting to a memory-haunting Gallican dy one of the sublimest hymns in the range of Mediæval ody—

Iste Confessor Domini, colentes
Quem pie laudant populi per orbem,
Hac die lætus meruit beatas
Scandere sedes,

nn for the Feasts of Confessors, whose irregularity of has precluded its rendering into truly graceful English t the proper plain song melody. The compilers of the nnal Noted"—to whom we cannot owe a sufficient debt of ude—attempted its translation in the early days of the ecclesiological revival (1848-60), but their translation has rilliance yet stiffness of a gem, while the verses of the poet resemble the soft dewy freshness of a flower.

etween each verse the player of the great organ at the end of the cathedral takes up the strain, and improvises it in a manner thoroughly French. Sometimes the tones e instrument shake the pavement beneath the feet; some- they seem full of passionate pleading; anon, they trip urefully along, or flash out in sudden brilliance, like a ain springing upward and tossing the sunlight from its d drops.

he Introit proper for the day concluded, the organ s out again in delicious interlude by way of relief to its e plain song, and to that of the Kyrie, suggesting the con- between Corinthian and Doric, or between Flamboyant Lancet. This morning at Troyes the music is what is n among ourselves as the "Missa de Angelis," wherein s one of the most beautiful pieces of plain-song writing I , viz. the Amen at the end of the Credo. The ritual ghout befits the dignity of such a cathedral as Troyes. djourn to the nave for the sermon, which must have a ualising effect, for a rich vein of copper lines the alms-bag it is handed to me by a suave surpliced canon. Coppers, are rained down from hands *bien gantées* when all is into the tin mugs of beggars who, continental fashion, the principal approaches to this cathedral.

he afternoon is spent in again attending the cathedral ce. This time I take a chair in the pourtour of the choir, well upon the glorious painted effigies of saints in the ows of the clerestory.

Iste Confessor" is again sung, this time as Office hymn before the Magnificat. Then comes a delightful stroll gh the fields surrounding the city, environed by hills n, under the conditions of sunlight at this time of the day, a lovely violet hue.

spection of sundry old village churches, which, with countrified fittings, are a perfect revelation to the eccle- gist, divert the walk very agreeably, and as darkness falls es is regained, while the curfew rings from the isolated of one of those large, plain Flamboyant churches ion in this part of Champagne, and whose interior, ed at this hour, wears an appearance truly awful and essive.

(*To be continued.*)

he Trustees and Congregation of Coldhouse Baptist el, Shudehill, Manchester, have decided to apply to the ity Commissioners for power to sell the building, which was ed in 1740, and to apply the proceeds to the purchase of a or a new chapel at Didsbury.

THE HOUSE OF JOHN KNOX.

A PAPER was read by Mr. C. J. Guthrie, Q.C., F.S.A.Scot. at last week's meeting of the Edinburgh Scottish Society of Antiquaries, on "The Traditional Belief in John Knox's House at the Netherbow Vindicated, being a reply to two papers read to the Society by Mr. Robert Miller."

Mr. Guthrie said that among the services rendered to Scotland by this learned Society has been the preservation, largely through its efforts and influence, of John Knox's house at the Netherbow of Edinburgh. After pointing out that there was no author, antiquarian, theological, historical, biographical, literary, or no anonymous guide-book writer but did not put forward John Knox's house as one of the few remaining historical monuments in Edinburgh, Mr. Guthrie said that Edinburgh had nowadays only three buildings associated with all the great actors in what Thomas Carlyle extravagantly called the only interesting period in Scottish history—the Reformation period—James V. and Mary of Lorraine, Cardinal Beaton, Mary Queen of Scots, the Regents Murray and Morton, Maitland of Lethington, George Buchanan and John Knox. He referred, of course, to the Castle, St. Giles's and the north-west tower and abbey church of Holyrood House. Connected specially with John Knox, they prided themselves on two other buildings, the Magdalene Chapel in the Cowgate, where Knox sat as a member of the first General Assembly, and the house at the Netherbow, where he died. Was the slender number of these ancient monuments now to suffer reduction? They had hoped rather to have seen them added to through the labours of Mr. Miller. Was it not possible even yet, instead of attempting to take away Edinburgh's treasures, to increase them? The burden of proof lay on those attacking the house. He declined to encumber the issue with an inquiry into the whole period of Knox's Edinburgh residence. If he ever stayed in the house, that was enough to entitle the house to the name. That he was in other houses as well between 1560 and 1572 was of no more concern to him (Mr. Guthrie) than to show, as could be done with equal success and equal futility, that from his birth, in 1505, down to 1560 he never set foot in the Netherbow house. The elaborate exposure given by Mr. Miller of the many stories woven round the original tradition by ingenious persons was beside the mark. The exposure had been often done before, but would no more affect the question than if anyone—establishing, as he could easily do, that the flooring outside Mary's bedroom at Holyrood had been renewed within fifty years, and thus exploding the legend of the blood-stain—were then to maintain that the whole connection of Rizzio with the north-west tower of Holyrood must be given up. He would be proud to be known as the champion of the tradition that Knox resided in this house, but he declined the distinction which Mr. Miller sought to confer upon him of being the champion of a legend which affirmed that Knox had a well in the house at which there were secret baptisms, that the carved outside figure at the corner was a genuine portrait of the Reformer, and that Knox was in the habit of preaching to the people in the street out of a window. If, then, the question was, had it been proved that John Knox never resided in the Netherbow House, what hung on the answer to that question? At present the house continued ticketed "John Knox's House." To satisfy all forms of scepticism, however, he said to some friends that he was getting a sign painter to interline two words so as to make the board read, "The alleged house of the so-called John Knox." But he found that in Scotland one must joke with caution, for the result had been that he had been told by quite a number of people that they had been informed (two of them said by Mr. Miller himself) that he had lost all faith in the house. What was to be the practical outcome? Obviously, there were only two courses. Either the house must continue to be shown as John Knox's, honestly believing, as the trustees did, that it was entitled to the name, or the board must be removed. But if, on being convinced that the house was not John Knox's, they removed the board, they could not stop there. The removal of the house itself must follow, and in its place they would, he supposed, erect a neat tenement built to resemble in style, so far as possible, that adjoining Grecian structure whose exquisite appropriateness to its surroundings all people of taste, including the Cockburn Association, had so lavishly praised. Inferences were, no doubt, suggested so as to shake belief in the probability of the tradition being accurate. He could only say, as a lawyer, that these inferences seemed to him strained and inconclusive, as well as insufficient to outweigh the fact of the tradition. Doubt was abundantly cast on the tradition, but proof of its falsehood there was none, and in the present state of their documentary evidence there could be none, because it was admitted that Knox passed at least two years of his life in Edinburgh in a house or houses of whose situation there was no documentary evidence whatever; that was to say, fully two years during which, or part of which, he might, for aught yet seen, have lived in the Netherbow House. It was no use to reply that there was no original documentary evidence that he lived in the

Netherbow House during that period. He did not need documentary evidence. He had the tradition, which his friends had got to disprove, unless they went so far as to refuse all value to all tradition. The house then, being old enough and commodious enough to have been Knox's, and in suitable proximity to his church, while comfortably removed from the guns of the Castle, might have been inhabited by Knox, unless it could be proved either that during his whole residence in Edinburgh he lived elsewhere, or that the house was so occupied during the whole of Knox's Edinburgh life that accommodation could not possibly have been found for him and his family within its walls. Proof of residence elsewhere covering the whole period admittedly failed to the extent of fully two out of twelve years. What remained? Was there evidence that the house was an impossible house for Knox? He had heard none. Mr. Miller rejected it chiefly because Mosman was a Catholic. But it would be alien to all they knew of the customs of the time for a Catholic house proprietor in Edinburgh to have refused house-rent from the Town Council of Edinburgh, whoever might be the tenant for whom the Council were paying rent, so mixed up so that they could not be disentangled, and the whole must be rejected. Mr. Miller's admissions of ignorance of Knox's residence during two years seemed to him (Mr. Guthrie) to leave ample foundation for the belief that Knox lived in the Netherbow House, and that as to the legend attached to the house being "an invention altogether of the present century," the only legend to which the present century could lay exclusive claim was the unfounded assertion, stated for the first time in the last decade of the century, that John Knox never lived in the Netherbow House. Taking November 1569 to May 1571, when Knox went to St. Andrews, it was scarcely denied that during this period, or part of it, Knox might have occupied the Netherbow House. But it was said by Mr. Miller that, suppose he did, no such residence would entitle the house to its name, because nothing that occurred during these years "could have consecrated his residence as the Mecca of Scottish religionism." Mr. Guthrie proceeded to show how this period of Knox's life, when he was struck down with apoplexy, was of the greatest moment to the people of Scotland and England, while interest was attached to the house from the fact that the news of the murder of the Regent was first brought to it. Mr. Miller based his theory that Knox did not spend the last three months of his life (August to November 1572) in Mosman's house, that it was too remote from St. Giles's for him to walk there in his feeble state. That was founded on Knox's account of himself, written from St. Andrews, that he was "half-dead." At that period, Mr. Guthrie showed, Knox was able to walk from the abbey of St. Andrews to the parish church, which was 550 yards, the distance from the Netherbow to St. Giles's being only 410 yards; while Kylligrew said, "He caused himself to be carried to St. Giles's." Mr. Miller often reminded them of the risks their tradition had run of becoming distorted, handed on from generation to generation during the long space of 234 years, from Knox's death in 1572 to 1806, when it first appeared in print. This looked plausible at first sight. But it crumbled when they grasped it. Two hundred and thirty-four years. Yes, that was the arithmetical distance between 1572 and 1806. But in the transmission of knowledge there was no such gap. If the doubts about John Knox's house, suggested so recently for the first time, had been stirred in 1806, when the house was openly and without challenge claimed for Edinburgh as Knox's residence, they could have had evidence of recollection going back certainly to 1731—recollection of statements made by old people who had themselves derived their knowledge at first hand from persons alive at Knox's death. And now he came to a genuine specimen of the genus red herring—Mr. Miller's naïve suggestion that during all these years all the world had been taking off their hats to the wrong John Knox! Stripped bare, what did his facts amounts to? He had found that before, in, and since Knox's time there were house proprietors in Edinburgh of the name of Knox, some of whom were named John. He called that a discovery. He (Mr. Guthrie) traced out some of these worthy citizens more than ten years ago, but never imagined he had made any discovery. He thought, looking to the commonness of both names, the existence of such people went without saying. They were gravely asked, "May we not surmise that here we have tracked the legend to its lair, and that either Stark or Stark's unknown informant had seen the name John Knox in some title deeds of property in this locality, and was led immediately to the conclusion that no John Knox could be of importance but one?" Why should they surmise anything of the kind? Suppose that Stark was led to that conclusion, how did that affect the name of this house, and how did Stark come to transfer a John Knox owning property away up the street to a house down at the Netherbow? If in the title deeds of this house they had found among former owners or tenants a "John Knox," not the Reformer, you might have argued with some decent show of plausibility that, however improbable, it was at least possible that in later years a confusion had arisen between John Knox the tradesman, John Knox the Reformer. But Mr. Miller's point in and part of his case was that no such name was ever associated the titles of this house. Where, then, was there room the mistake to come in with reference to this ho The mistake, if it came in at all, could only com with reference to one of these other houses actually ow by another John Knox, and that only supposing an these other houses had been found associated in later t with the Reformer's name. But no such thing had happe One would have expected some house to be associated Edinburgh's greatest citizen for long after his death by common people, among whom traditions linger. But t was not, and, so far as they knew, never had been, tradition connecting the Reformer with any house excep house in the Netherbow, which they believed had been ha down from one generation to another because it was the h where he died. He closed with a challenge which he thrown out before, and which had never been faced. Stark's statement, publicly made in 1806, and Dr. M'C statement, made with equal publicity in 1811, and Ro Chambers's statement in 1823, were inventions, why were not questioned? Was it because the people in the begin of the century had not the necessary information? They ne no information, but only their own recollection, to stamp a invention what, if Mr. Miller be right, must necessarily have known to be an invention by all Edinburgh people. W because no one had any interest to deny the statement? The opposite was the case. In 1849 the house was defended s as the undoubted residence of John Knox. If that chara istic of the house could have been effectually challenge whole ground for the opposition to the Council's decree w have disappeared. So passed the "Legend of John K House," unwept, unhonoured and unsung. But the trad remains, an honoured heritage from the past to be hande to the future. When the names and the writings of all who have taken part in this friendly controversy had been buried in oblivion, John Knox's House at the Netherbow w continue to vivify the name and the fame of the greatest the greatest statesman, the greatest churchman whom God yet given to the service of the Scottish Church and the Sco people.

THE ARCHITECTURAL ASSOCIATION

A MEETING of the Association was held on Friday ing last at 9 Conduit Street, W., Mr. G. H. Fell Prynne, president, in the chair.

A vote of thanks was passed to Colonel Edis for perm members to visit the Great Central Hotel, Marylebone on March 11. Mr. E. Wragg, resident engineer at the Central Railway Station, adjoining the hotel, was also acc a vote of thanks for conducting the visitors on the same over the station.

The next spring visit was fixed for March 25, at 3 P the Fire-Testing Station of the British Fire Protection mittee, at North Bank, Regent's Park, N.W.

It was announced that the two following classes shortly commence:—Quantity Surveying—lecturer, Mr Leaning; Land Surveying—lecturer, Professor H. Adan

Mr. Reginald T. Blomfield, M.A., read the following entitled

Certain Reflections on the English Renaissan

I have been invited to address you this evening on th ject of the English Renaissance—a subject which, histo treated, would be quite beyond the scope of a single I propose, therefore, to call your attention to certain of this chapter in history, and to endeavour by this m disentangle some clue to guide us through the perplex modern architecture.

Any conclusions which I may offer you, however express them, I offer with great diffidence. The prese dition of architecture is so unsatisfactory and so bes difficulties, both in theory and in practice, that the m can hope to attain to is some firm foothold on the history—a foothold from which we can start again with a glimmering of an idea of the goal at which we aim architecture, the oldest of the arts, we can only consid selves on safe ground so long as we keep in touch wi has actually been. You may recollect the words that le-Duc used nearly forty years ago, "If art has lost its a us not impel it to the right or to the left under pretence ducting it into the true path. . . . The study and love not of one form of art—are the only means to which we will recur when art seems to decline." It is only by and critical study that we can hope to retrace our pa highway of architecture.

A comparison has been made between the Renaissa the sixteenth and seventeenth centuries in England and the nineteenth (assuming, of course, that the latter exis

to test the worth of any such comparisons it is necessary
nsider for an instant what that great Renaissance was of
our own sixteenth and early seventeenth century archi-
e was but a distant echo.

here are two points about this movement which differenti-
from any others in the history of art. The architecture
ancient world was one long continuous progression from
n beginnings in the East till its disappearance with the
all of the Roman Empire. There was no break in the
ic art of Egypt and Assyria. This, again, only developed
freer and more perfect expression in the hands of the
s, to be adopted by the Romans and wrought into the full
ssion of their own magnificent genius. Architecture
flourish in one place more than in another, but throughout
ng history there was no break in its continuity. Its
ical development went straight ahead, with no throw-back
lier art, till its vitality dwindled, and it died out with the
ing forces of Roman civilisation. There was a curious
ivity about the ancient world which prevented any intense
ion of its life and thought on its visible art. That art
ettled for it. It was accepted as part of the established
of the State, and so it ran its course without regret and
ut ambition.

ow the Renaissance was a conscious return to the art of
st; to the art, that is, of the Roman Empire. It was not
e revival. It was a deliberate and successful attempt to
into the spirit of the great Roman architects. What
s it the more remarkable, and indeed without parallel in
y, is that there already existed another method of archi-
e in full and complete maturity, for Gothic architecture
eached the very limit of technical skill—witness King's
ge Chapel alone. Yet men were prepared to turn their
on this traditional art; they were learning to welcome the
nethod, to repudiate their familiar language, as no longer
ate to their needs. For the first time we strike the
cteristic note of modern art, its intense subjectivity, its
erate consciousness. This momentous change in archi-
e did not result from the craftsman's instinctive habit of
ng on the past, but from a change in the direction of
gence, from a certain revulsion in ideas, not from the
and reaction of craftsmanship.

or changes in architecture come about in one of two ways.
a method (or style, to use a doubtful term) is fairly
lished as traditional, the actual manipulation of materials
rkmen and the introduction of new materials lead to the
sion and modification of the style itself—as, for instance,
rowth of Perpendicular Gothic out of Decorated. The
opment comes from within, and proceeds more or less
sciously.

ut there is another source of change in architecture. In
curse of ages the seeds of change are slowly at work, till
results some great upheaval of ideas which dislodges
ind from its mental anchorage. The old idioms seem
ingless, the familiar formula barren, and then comes that
tive effort after a new expression which will gradually
nd and consolidate into a permanent art. A new factor
ave taken its place in human intelligence which has to be
nised, however much our sympathies may lie with the art
s replaced. Such a change occurred at the Renaissance.
nce the fighting days of the Dark Ages civilisation had
ily advanced. Men were rich, intelligent, learned; and
keener and more active minds had long since shown
tience of Mediæval standards and idioms. There was
one direction in which this enterprise could find its
al outlet, and this was scholarship. Latin was the
iar language, scholars naturally turned to the country of its
, and so from the study of the literature of Rome they
to the study of its art, and that art was adopted with
siasm as the only fit expression of Humanism, that new
ve in thought and morals which the Renaissance won back
nankind. In this regard Alberti is typical of the earlier
issance; a man of noble family and brilliant personal
ties, he can have found little to attract him in the
ssional side of architecture. His reward lay in his keen
ment of the art, in the occasion that it gave him for the
ise of his own fastidious scholarship. Thus, the peculiarity
e art of the Renaissance is that it was much more than a
change of technique. It was the result and the
ssion of a new order of ideas which had been slowly
ing for generations until it became articulate in art; some-
altogether greater than the small ephemeral fashions
h are all that the nineteenth century has to show by way of
naissance.

ow, how did the English builders regard this far-reaching
ment? I think it is quite plain that in the first instance,
indeed for several generations, they did not in the least
rstand it. In the first place, they themselves were en-
ed in the Gothic tradition, trained exclusively in its method
nstruction, and unfamiliar with any architecture but that
ir own country, one might almost say of their own county.
in the second place, they were introduced to this new art
by amateurs. Merchants and scholars travelled in Italy and brought back astounding stories of its magnificent palaces. Soldiers and ambassadors, such as Lord Henry Marney, Lord Sandys of the Vyne, or Sir Richard Weston of Sutton Place, able and observant men, saw and appreciated the wide significance of the new movement abroad; and the king himself and Wolsey set the fashion by importing Italian artists for the decoration of their palaces. All the inspiration came from the court and the wealthier upper classes; and the English builder, probably somewhat against his will, had to set to work to master the strange new fashion.

The only acquaintance with it, as amongst Englishmen, was possessed by amateurs, and the workmen at first had to follow their instructions with such help as they could get from the work actually executed by Italian craftsmen in this country; and it is to be borne in mind that in actual fact not many Italians were over here, and that the majority of them, with the exception of such men as Torregiano, Rovezzano and the Majani, were quite inferior men. The results were the most ridiculous blunders in grammar, for the Englishmen endeavoured to make some rudimentary acquaintance with the Orders by way of ornament, but planned and constructed their houses according to their own tradition. As the sixteenth century went on, and the first Italian influence disappeared, their workmanship fell off, but their knowledge of the Orders grew. Students, such as John Shute, with some architectural training, were sent out by noble patrons to make systematic study of Italian architecture; and the German and Flemish workmen who succeeded the Italians brought with them an abundance of pattern-books, so that the business of decorating houses with fatuous ornament proceeded apace. I have mentioned elsewhere that singular instance at Shaw House, near Newbury, a building which I think characteristic of the state of mind of the Englishman in the time of Elizabeth. Here the owner had himself built a good house of brick and stone on the ordinary Elizabethan plan, but he then adorned it with inscriptions in Greek and Latin—I cannot help thinking, from their wording, with some little vanity in his own superior scholarship and knowledge of Italian art. Yet, in fact, the man was barely within the fringe of his subject. Correct details and Latin and Greek inscriptions were not of the essence of the Italian Renaissance, and it required a finer brain and closer training than was possessed by either amateur or builder of the sixteenth century to see the meaning of the great change that had taken place in Italian and, through Italian, in European art.

Yet even in far-away England the air, if one may say so, was instinct with its influence. The horizontality of Elizabethan architecture was itself a dim reflection of the great recovery of the Italian Renaissance; and the day was fast approaching when an Englishman of genius would see his way through all these troubled efforts and grasp the principle, the basis of idea, that underlay this fundamental change in architecture.

Let us consider for a moment what that principle was.

In spite of the researches of such men as De Geymuller, our younger students are rather apt to consider the architecture of the Italian Renaissance as an affair of detail. Their attention is arrested by its exquisite carving, its arabesques and other details, which form such a tempting subject for illustration. Yet all this detail might go, and the value of the work of the great Italian architects remain untouched. For the basis of their work, and it is this which gives it permanent value, lay in construction; their real accomplishment lay, not in ornament, but in their avoidance of it, and in their past-mastership of proportion and of the intellectual problems of architecture. They studied to some purpose the remains of the stupendous architecture of Rome. Not only did they extend, to a point as yet undreamt of since the days of the Empire, the use of domes and simple vaulting, but they recovered the use of the lintel in combination with the arch. They threw off the unreasonable intricacy of detail with which later Mediævalism had encumbered architecture, and brought back the art to its abstract basis in construction; that is to say, to the simplest and most direct methods of building—the lintel for crossing narrow spaces, and the arch for wide ones (I speak, of course, without regard to steel and iron construction, at that time practically undreamt of), flat ceilings, domes, or the simplest forms of vaulting for covering in their areas.

The great recovery that the Italians made from the remains of Roman architecture was this use of the lintel and the arch in construction, and the use of domes and simple vaulting. A dull man might have recovered its detail, but only the genius of Brunelleschi or Peruzzi could have disentangled these constructional ideas, simple as they seem to us now, and showed how they could be applied easily and naturally to every case, as an elastic method of construction, not merely as an exercise in scholastic canons of design. Given, then, a certain method of construction in good architecture, the design in all its multifarious parts must follow it. To the arch the Renaissance added the lintel, and it is in the play upon these abstract motives that the real significance of Renaissance architecture lies.

Now the first Englishman who really grasped this fact was Inigo Jones, and it is for this reason that his work is so profoundly interesting to us, and so completely differentiated from the work of his predecessors. At length there had appeared a man who understood architecture as the Italians understood it, who brushed on one side all the detail and ornament which had seemed to the Elizabethan and Jacobean designers the whole essence of the art, and had gone straight for the heart of the matter, realising that, after all, architecture is simple construction, ennobled and idealised by the working upon it of a powerful brain and highly-trained imagination, and that its strength lies in its own abstract qualities, fine proportion, bold distribution of masses, extreme reticence and simplicity of ornament. He saw (and few had seen it in England since the days of Early Gothic) that architecture is not ornament; that ornament, indeed, is only one, perhaps a subordinate one, of the many weapons which architecture has in her armoury. For the first time, after a hundred years of blind experiment, this country possessed a real architecture, a complete and flexible language. Instead of a set of quotations from a foreign tongue, it possessed at length an organic style.

I need not dwell at any length on the brilliant ability with which Inigo Jones used this style. His exact and fastidious refinement is familiar to all students.

Perhaps we are not all so familiar with the masterful freedom of his designs. It has been customary to insist on the greater versatility of Wren as compared with Inigo Jones, and a writer in the *Times* once attempted to make some absurd distinction between Jones and Wren, treating Jones as an Italian and Wren as the first English architect proper. The writer in the *Times* had the usual knowledge of amateur critics; but those who have studied the work of Inigo Jones and Wren know, in the first place, that Wren could never have started where he did if Inigo Jones had not preceded him; and, in the second place, that it is a complete mistake to identify the work of Jones with that pedantic version of Palladianism which the eighteenth-century architects set up as his particular manner. That Jones did adopt Palladio's architecture as the last word of the Italian Renaissance is, of course, undeniable; the point to be realised is that, whatever his imitators may have done, Inigo Jones himself worked with all the freedom of genius, a freedom founded on the most intimate mastery of the actual technique of his art. In this regard I think the distinction between Jones and Wren has been very much exaggerated, and Wren followed the lines laid down by Jones far more closely than has been generally supposed. The decadence began with the eighteenth century, with the men who succeeded Wren. Where Wren designed, these men copied, and they copied the least attractive features of Inigo Jones and Palladio. The pedantic conception of this man of genius which exists in the amateur mind is really derived from Kent's publications and eighteenth-century copies of his work.

I do not propose to follow further the course of English Renaissance architecture. The eighteenth-century architects allowed their art to be collared—if I may be permitted the phrase—first by amateurs and afterwards by men of letters. The strength of the old tradition kept them within some reasonable limit; at least, as late as the early part of this century. But that romantic element of literature which had made its first incursion in the days of Horace Walpole has encroached on architecture with disastrous rapidity and power in this century; so much so that, a generation back, it almost seemed as if the last trace of our fine traditional Classic would disappear under the preachments of men with no exact knowledge of architecture, who approached the subject from a standpoint entirely out of relation to the art itself. It would have been a curious result if that great development of architecture which owed its first origin to scholarship should have suffered its final extinction at the hands of the literary amateur.

To put together the results of this very general survey, I would suggest the following conclusions as the teaching of history:—(1) That the Italian Renaissance itself was the necessary result of far-reaching causes; (2) that our English Renaissance in its kind and degree was a part of this movement, and is not therefore to be dismissed as a mere change of expression in architecture, but must be accepted as part of an inevitable development, precluding a return to the motives and ideas that lay at the back of Mediæval art; (3) that in architecture the real work of the great Italian masters was to re-discover, almost to re-create, new methods of construction and proportion; (4) that the fact was not realised by the Elizabethan builders, who could not see the wood for the trees, and that actually it took about 100 years of experiment to produce the man who could see beyond this detail, and establish order and logic in the tangled maze of English architecture; (5) lastly, and as a corollary to this, that the mere fact of his having done so and the circumstances of the case have brought about a permanent change in the work and position of the modern architect, to which I will call your attention later.

Now, how do we stand at this moment in regard to the theory of architecture? I do not mean abstract theory as to its philosophical basis, but our own attitude to the art. are the sources to which we look for inspiration? Wh the ideals at which we aim in actual design? I fear th answer to this question can hardly be satisfactory.

We are, here at the end of the nineteenth century condition of greater uncertainty and more complete abse conviction than, I should say, at any previous period of hi You have merely to look back upon the last 100 We began the century with the remains of the classical tion, but Adam had already "improved" it, as he tho Stuart and Revett had done their work, and the Greek f was well in the ascendant. Then came Pugin, ardent, fan full of energy and narrow ideas, a very iconoclast in reg the old tradition; and after him Ruskin, who thought h found the key to architecture in his personal preferenc the morality of Exeter Hall. Then came the rush for (Early English, Early French, Early Italian, with a vehe that threatened to sweep the board clear of everything heterogeneous collection of details from every country. man has been for himself, and meantime architecture ha to the wall.

The serious study of architecture, not only as an a also as an expression of the intelligence which is not arb but determined by certain inevitable causes, has almost dr out of sight, and I suppose that, in practice, the very work that has ever been done in England has been done last fifty years. I need hardly add that a few men of po and original mind have done admirable work, but the a of architecture has been left untouched, and it is by the a level that the state of architecture has to be gauged. I think that we can look back with pride on the artistic ments of the nineteenth century, judged from any stan and it appears likely that we shall enter on the tw century without having hit upon any certain way throug quagmire of modern architecture.

It is here that the study of the past must help us. elsewhere endeavoured to trace the stages through wh function of the modern architect has developed. The the craftsman working independently, yet in uncon unison, ceased when the choice of styles arose. He ta the tree of knowledge, and henceforth to his knowledge craft had to be added the responsibility of conscious jud if he was to undertake, I will not say architecture, as it be thought to beg the question, but building of an Because, in any building nowadays, a man has to us method of expression in preference to another, and implic this there is raised the whole question of selection. No responsibility proved too much for the simple craftsman, may see from the blunders in design which abound i ambitious Jacobean works; and it was only a question how soon there should arise the man who had sufficien ing and intellectual capacity to enable him to discri between good and bad, to enable him to grasp the coherence in expression which is an essential element of tecture. As soon as such a man arose, the matter was for good or bad. The architect ceased to be a crafts the technical sense, and what might be lost in craftsn was assuredly gained in architecture. I think, therefo this critical function of an architect, this detachment f actual details of craftsmanship, which chafes the enthus some by no means the least gifted of our younger men, very essence of his work. The more of craftsmanship the better; but a man may be a very good architect being a very good craftsman—I mean, a good craftsma sense of being able to carve his own woodwork and mo own ceilings.

His craftsmanship must be of a wider range. embrace full knowledge of the past; it must rest on a habit of analysis of the best methods of expression in li and a keenly critical insight into the abstract qualities tecture, mass, balance, rhythm and proportion. An a to my mind, should be like a fastidious man of lett should not be content to express his purpose anyhow, h be anxious to find the exact inevitable phrase. It i sense, I think, that an architect should be an artis highest order, and this is the position that has, in fa, forced upon him since the days of the Renaissance. this reflection may be some consolation to those wh reluctantly abandon the idea that in craftsmanship e future of architecture.

Nor, again, is this ideal less exacting than the oth attain to this faculty of reasonable judgment it is clea man must possess knowledge of what has actually been architecture—the more the better, provided he is n burdened by it; and this knowledge is not mere studen ing, but means a practical knowledge of buildings, gi careful analysis and measurements, and by exact obse of materials and local circumstance. A lifetime of study is not too much for such a task.

I would suggest to you, therefore—to those of you h who are now beginning your career—that there is no so

rchitecture through pattern books, or even through the sant paths of detail craftsmanship; but that, nowadays at rate, you must have knowledge, and that now, as always in istory of architecture, you must seek that knowledge, not in books, but also in the builder's yard and on the scaffold- of buildings.

have still one more point to bring before you. Perhaps in paper I may seem to you to have insisted too much on know- e, too little on imagination, and the criticism has been e on some remarks of mine elsewhere. In the first place, uld point out that we seem to be face to face with some gerous developments of originality, or rather eccentricity. judge by the majority of our buildings, it appears to be ght that "knowledge hampers imagination," as it was put he eminent Capability Brown. Certainly the results are a nightmare of architecture. Now there is only one dote to this sort of originality, and it is knowledge. I y that some of the more accomplished of our original gners would be rather surprised to find that the flattest of ogees, the boldness of their amazing proportions, have anticipated, not only in Italy, but even in England. Even rsory knowledge of the work of such a man as Baldassare izzi would show them that profound knowledge is not incom- ble with the most complete freedom in design; and further, the most daring imagination can co-exist with the most al detail. You may recollect the indignation of the old ir de Chambray at the pretensions of the men of his time, thought that by turning a capital upside down, or some- g of the sort, they had invented a new architecture, "as if Pantheon" (I quote the Sieur de Chambray), "that e stupendous and incomparable structure, were not the ntion of the architect who built it, because he has vary'd ing from the Corinthian ordnance, of which it is entirely posed."

In the second place, and this is the gist of all that I have , this knowledge is not an end, but a means. For an itect does not study in order to reproduce what other men e said once and for all, but to perfect his own mastery of ression; and just as a poet does not invent a jargon of his or write in the language of Chaucer, but takes the current guage of his time, and compels it to his purpose, so an itect would not waste his time in a vain ambition of a new e or a futile copy of an old one, but would master the best ll the architecture of his country, and find thereby an ample guage for his own individuality. It is not styles, therefore, we are concerned with, but style, that indefinite quality of good architecture, whether Greek or Roman, Gothic or aissance; indefinable and ever-varying, because it varies n the individuality of the artist, because it depends on faculty that the man possesses of giving the simplest yet the most complete expression of all his purpose.

It is here that knowledge must come in as the groundwork ood architecture. We want to know, as part of our train- in our art, how other men in the past have solved the diffi- ies that confront us now; and it is only by this long rious study that we can learn to discriminate between good bad, and to free our own method of expression from what rivial and irrelevant. It is this way, I think, and not along pleasant paths of the amateur, that there lies the best nce of the architecture of the future.

A short discussion followed.

TESSERÆ.

Paris in the Seventeenth Century.

N the "Traité de Police," a document of the time of Louis XIV., a curious proof is given of the small degree salubrity which the inner streets of the city down to so late eriod enjoyed. It is mentioned that the Sieur Courtois, a sician who dwelt in the Rue des Marmouzets, had his ncipal sitting-room looking out to this street, and he used to erve that every morning a pair of large brass dogs, which used for supporting the flaming logs of wood in his fireplace, e covered with a tolerably thick coating of verdigris, occa- ned by the deleterious vapours which rose from the street ow. The worthy physician appeared to have had sufficient fidence in his own healing skill not to remove from such a ghbourhood, or probably it was too lucrative a district, as y well be imagined, for any medical man to make bones ut so small a matter; and therefore, as he proceeds to te, his servant used to clean the brass dogs every morning, they were ready for the renewal of the phenomenon within four-and-twenty hours next ensuing. How the shop- pers fared in the dark holes which they rented on a level h the Stygian stream of mud and filth that stagnated in the tral kennels is not said; but in those days people were not fastidious as in our degenerate times of "Eau de Cologne," au de Mille Fleurs," "Extrait du Zéphir," &c.; and, as Dr. urtois further remarks, they allowed "the corrupted air to ke so much the more malignant an impression on their lungs and other viscera, as those parts of the body are incom- parably more delicate than copper or brass—which is, no doubt, the cause of many maladies." In those days no one in Paris who pretended to the character of a gentleman ever thought of going into the streets on foot, unless stoutly booted; and a boot of the time of the "Grand Monarque" was a foot- and-leg preserver of about the same degree of elegance and strength as the waterproof equipments of a modern Fen farmer from the heart of Lincolnshire.

Nature and Art.

On the discussions of art there is no greater obstacle to the setting forth principles than the unsettled terms nature and natural. They are indeed the limits of art, beyond which there can be no legitimate exercise; but the boundaries remove themselves out of sight, or contract themselves within the smallest space, according to the fancy, perhaps we should say the genius, of the disputants. To those of the contracting system the art is considered as nearly entirely imitative of external visible nature, with a power (scarcely of creating) of combining, of putting together things that are, exactly and no other way than as they may be, and have been, though not so seen, perhaps, at the moment of any incident to be represented. Others again by nature admit whatever the mind in its most sane, healthy, imaginative, comprehensive state can conceive. As we believe the latter is the highest and best sense in which nature, as applied to art, is to be understood, so do we believe it is the truest. It is the highest, because it is the most creative; it is the truest, because, with regard to its general reception, it carries with it a spell not to be denied, enforcing a general credence, if not conviction. In the best and healthiest state of the most discursive imagination there is an intuitive knowledge, instantly forming a judgment and decision, as to that particle of the natural, in even the least imaginative minds, which will unite itself, as by a chemical affinity and attraction, to the natural portion in the created and fanciful, and by that amalgamation make all be, or at least appear, as natural. The true creator never loses sight of this—the judgment is ever with him; he decides by it, and this judgment, presiding over creative power, constitutes genius. Genius, then, or art—for consummate art is genius—not only has the power of creating a world for itself, but of creating in the minds of spectators and hearers a belief in its existence. It is very strange that this should be so generally felt, and it can scarcely be unacknowledged with regard to poetry, particularly the drama, and yet be denied in reference to the art of painting. Because painting is the visible art, it must with some be merely the imitation of things seen; whereas poetry and music are, in the same sense, imitative as painting, and in no other—unless, indeed, we speak of the lowest kind of painting, that deadweight fastened to art by an indissoluble chain, but which was never intended to keep it from rising. It should rather be the ballast, to keep steady the aeronaut in his upward course.

Italian Towers.

The campaniles and towers of Italy are the only works of the Middle Ages that appear to have attracted the attention of all travellers. Their isolation from the churches, by which the effect of their great height is increased, the large proportion of the height to the base, their nearly equal diameter through- out, and the absence of projecting buttresses—in all respects contrasting with the towers of the Gothic architects—have given them a very picturesque and striking character, although in architectural beauty and splendour they are left far behind the works of the latter. Some of them have even acquired celebrity from the carelessness or ill fortune with which their foundations were prepared, which has caused them to decline considerably from the perpendicular, as at Pisa and Bologna. This has been converted by the patriotism of the Italians into an additional proof of the skill of the architect, who was able to make a tower lean so far over its base without falling. Cresy and Taylor have shown very satisfactorily that this was not the case at Pisa, as the scaffold holes incline just as the tower does; and also that the settlement must have begun to show itself before the completion, from the attempts that were made to rectify it by increasing the height of the columns and cornices on the lowest side, in order to throw the upper part of the building in the opposite direction. The same artifices are to be seen in the Garisendi tower at Bologna. The brick towers at Rome are square: the basement storey is carried up without apertures to a height about equal to that of the roof of the building to which it belongs; above this the tower is divided by brick cornices into storeys, the number of which varies in the different examples. At St. Maria, in Cosmedin, there are seven, exclusive of the basement. The two lower ones have on each face two round-headed windows, and the third three; the remaining four storeys have on each face a window of three lights. The whole is capped with a plain roof. There are an abundance of towers at Rome differing from this only in the number of storeys and height. The same disposition of the tower into a tall plain basement surmounted by a number

of storeys of pretty equal height and separated by a small cornice is to be found in a great number of instances besides those at Rome, but the management of the windows is somewhat different. These consist of an arcade with bearing shafts, and, generally, their arches are of two orders; the first order on corbels, but the shafts are brought forward to the front, and the number of arches or lights in each window increased in the upper storeys. At the tower of Siena Cathedral the number of lights in the six upper storeys increases upwards in a regular arithmetical progression, the first having one light, the next two, and so on till we come to the highest, which has six lights. The cathedral and St. Michele at Lucca have towers nearly the same.

The Villa Medici.

How many artists have been launched, after their three or four years' study and domiciliation in the Villa Medici, on the French capital, to make their fortune or to find their ruin, and be lost amidst a host of competitors, perhaps of superior claims, or equal perhaps, for whom the cards of life have played better! How many of them must have died prematurely of that fatal disease which may have been averted for a season by the genial climate to which they had been providentially sent! With what sad forebodings of the future must many of them have left this beautiful and entrancing scene! With what dejection did they lean their backs against the base of that colossal Minerva, and survey for the last time a view which, though none can paint it in words, must have been a favourite study to many an enthusiast of the fine arts! How sadly, on the evening preceding their departure, would sound the music of the fountain before their bedroom window, or the nightingale's plaint heard almost close to their pillow! How they must have watched the last sun set over St. Peter's, or stole out once more to see the dark shade of the Borghese pines lit up to them for the last time by the bright moon of a Roman sky! How the last sight of the Niobe and her children—how those little bits of sad monumental antiquity, let into the garden wall, with every line of which they must have been familiar, must have made their hearts ache, as they returned solitary from the terrace, or smoked a last cigar with an old friend in the room which they were called upon by inexorable destiny to leave, after four years' enjoyment, and when they would have gladly said *esto perpetua!* If last times be always sad, how much more so to those who here formed their earliest friendships in a common pursuit; who here together frequented the studios, where they dreamt of a success or reputation which they mutually encouraged each other to expect; who sat at the common table, and were ready, with mutual assistance, to go where stern reality must crush the hopes of most of them in the selfish vortex of Parisian existence! And if in after life they ever do come back to enter the gates of the Villa Medici, no longer as alumni, but as visitors, how must the unchanged loveliness of all around lacerate them with vain reminiscences and regrets! Even the sensibilities of every new director must be powerfully touched when he revisits, no longer young, these scenes of his now accomplished hopes, honoured though he be, and rich. How much that gave a peculiar charm to the Borghese landscape, the society of his early and warmest friends, is necessarily no more! He returns, and it is to govern, but he returns alone—everything but himself unchanged, even to those little studios in the grounds where he chiselled and modelled, and where, when his first bust was exhibited or his first picture uncovered, flattering strangers came in and predicted that he must succeed.

Stothard's Unworldliness.

Many of Stothard's friends pointed out to him the policy of consulting a little more the taste of the public at Somerset House, where the Royal Academy exhibitions were held, and wished to prevail with him to paint a picture expressly for that atmosphere, but he never heeded them. He would not step an inch out of his way to gain popularity when he was sure of fame, and so little had he of the tact of the world within himself that he never could comprehend its utility. He had not one thought that was worldly in his own mind, and never, therefore, painted for money as money. Painting was his profession, and if he gained by it sufficient to live respectably, and to leave something to his children at his death, he was satisfied; but he never made pecuniary return the object in any one piece that he executed. Had he done so, and had he possessed more worldly tact, it is well known he might have died rich, for he had always more to do than he could execute without the most unwearied application; so much was he at all times estimated by the publishers for the varied power of his imagination in the art of illustration and design. Yet so little conscious was he of the pecuniary value of his talents that he received but 200*l.* for the *Canterbury Pilgrims*, a picture which was afterwards exhibited by itself, at one shilling a-head, in all the great towns of England, was engraved first by subscription (the proofs six guineas, the common impressions three guineas each), and had the most extensive sale of anything of the kind published within the last century; and the picture itself, returning such golden profit to the possessor, was finally for 900*l.* or 1,000*l.* It is, however, but justice to the ori proprietor to state that the sum of 200*l.* was fixed upon the price of the picture before Stothard commenced the so that the very high finish he bestowed upon it was, o part, a labour of love, and affords another proof, we needed, how little he cared for the price, so long as the pai was perfect. To do justice to his subject was always his object, and the great point of his ambition. He never co the fashion of the day in his drawings, for though the wor no individual artist have ever been so often engraved, cipally in books, yet he never executed one design with a to its attracting in the print-shops.

GLASGOW ARCHÆOLOGICAL SOCIET

At the monthly meeting of the Glasgow Archæolo Society on the 16th inst.—Professor Young in the ch Mr. James Macdonald, LL.D., read a paper on the inscrip on the distance-slabs of the Antonine Wall. Mr. J. O. Mit LL.D., made a contribution on "The Old Highways o Moffat District." He pointed out that the original makers in the locality were the Romans, one of whose roads ran from Carlisle through the parish, following p cally the route now taken by the Caledonian Railway. route came in later times to be entirely abandoned, an north and south traffic through Moffat was diverted by w "The Beef-tub" and Ericstane Moor. It was by this that the Glasgow and London mail, begun in 1788, trav At a later period, about the end of last century, the old R road down the Evan Water was revived, and after many culties was converted by Telford into the famous Glasgo Carlisle road, one of the finest in the country, along whic splendid mail service was conducted until it was supplant the railway. The authors of the papers were thanked for contributions.

GENERAL.

Seven Statues have been commissioned for the faç the National Portrait Gallery, Edinburgh, out of the fund giv the late John Ritchie Findlay. The Scotsmen commemo are Sir James Douglas, the companion of King R Bruce; Gavin Douglas, one of the most eminent of the Scottish poets; Sir David Lindsay, a famous poet of the teenth century; John Knox, the reformer; Viscount Sta eminent lawyer and publicist of the seventeenth century Hunter, a well-known surgeon of last century, and Dr. H a celebrated geologist.

An Exhibition of all sorts of electrical appliances a able to domestic uses is to be held in May next in the Post and Telegraph Office, Place de la Monnaie, Brussel

Mr. L. F. Day will write the Easter number of th *Journal*, entitled "The Art of William Morris." It w illustrated by about fifty designs and other works. M these will be from the actual designs, thus not only sh Mr. Morris's autograph handiwork, but revealing also thing of his method. It will also contain examples of his decoration.

The New Hippodrome in course of erection in Pa the Boulevard Clichy, at the angle of the Rue Caulaincot the Rue Forest, has for architects MM. Cambon, Dur Galeson.

A Meeting of the Iron and Steel Institute will be August in Manchester. Mr. R. S. Platt is chairman executive committee, and Mr. T. Ashbury honorary secr

The London Water Bill (Welsh Reservoirs and V promoted by the London County Council, came befc standing orders committee of the House of Lords on M when it was decided to dispense with the standing On Tuesday, however, the Bill was rejected in the Hc Commons, on the ground that it was inexpedient to c the subject until the report from the Royal Commissi received.

M. Plumet and M. Benouville have been selected Société Nationale des Beaux-Arts to represent architect the jury of the Exhibition of 1900.

Priory Lodge, Hampstead, in which Dr. Samuel J lived, which was to be pulled down to make room for fla be spared, as the house has been taken by the nuns Convent of Harley House, Marylebone Road, who wi into occupation about a month hence.

The Truro Cathedral Committee have accepted a te 34,000*l.* to erect the nave and western towers as a mem the late Archbishop Benson.

IMPORTANT NOTICE.

ORKMEN'S COMPENSATION ACT.

, view of the many difficulties which are certain to e in connection with the law, practice rules and edure under the above Act, we have added to our f A VERY EMINENT BARRISTER, who has made subject a special study, and will be glad to answer ne columns of this paper any questions relating to complicated matters arising from the provisions of difficult Act. Our LEGAL ADVISER will further ver any legal question that may be of interest to readers. All letters must be addressed "LEGAL VISER," Office of "The Architect," Imperial Build- Ludgate Circus, London, E.C.

EDITORIAL NOTICES.

authors of signed articles and papers read in public must necessarily be held responsible for their contents.

ommunication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

espondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. *on Thursdays.*

NEW READING CASE.

Librarians of the Public Libraries and Reading-ns.—A new handsome Reading Case can be supplied nominal charge of 2s.. by post 2s. 6d., on early ication to the Publisher, Imperial Buildings, Ludgate us, London, E.C.

For Advertisement Scale, see page xiii.

NOTICE.

Friday being Good Friday, THE ARCHITECT *will be published on Thursday. All Advertisements intended for this Number must reach the Office not later than* 4 P.M. *on Wednesday, March* 29.

COMPETITION OPEN.

BRADFORD.—April 14.—Designs will be invited for the erection of the Bradford Corporation Cartwright Memorial Hall, at a cost of 38,000*l.* Three prizes will be offered, value 150*l.*, 100*l.* and 50*l.* respectively. Particulars will be found in another column.

CONTRACTS OPEN.

ABERDEEN.—March 29.—For erection of mansion house at Kildrummy. Mr. A. Marshall Mackenzie, architect, 1 Bon-Accord Street, Aberdeen.

ALLERTON.—For erection of four through houses and house and shop at Prospect Terrace. Mr. R. Drake, architect, 142 Allerton Road, Allerton.

ALLERTON.—For erection of a villa residence, stabling and other works, at Chellow Dean, Allerton. Mr. J. W. C. Atkinson, architect, 1 Ivegate, Bradford.

ASHBY-DE-LA-ZOUCH.—For erection of a house and stable, &c., on Tamworth Road, Ashby. Mr. Pickthorn, Market Street, Ashby-de-la-Zouch.

ASHTON-UNDER-LYNE.—For erection of a store at Littlemoss. Mr. A. J. Howcroft, architect, 12 Clegg Street, Oldham.

BARNSLEY.—March 28.—For erection of a girls' school, cookery-room, class-room, outbuildings, &c., in Park Street, Wombwell. Mr. John Robinson, clerk, Park Street, Wombwell.

MEMORIAL TO SIR H. DOULTON.

FOR more than twenty years the late Sir Henry Doulton was a governor and almoner of St. Thomas's Hospital. On Monday a memorial to him, erected by Mr. Henry Lewis Doulton and Sir Henry's other children, was unveiled by the Bishop of Rochester—the memorial taking the form of three handsome panels in the reredos of the Hospital Chapel. It is peculiarly fitting that the panels should be in terra-cotta and that the designer should be Mr. G. Tinworth, whose life and work have been so closely associated with the great Lambeth firm of which Sir Henry Doulton was the founder. Sir Henry had, so to speak, discovered Tinworth, and now Tinworth had provided a lasting and artistic memorial of his friend and benefactor. The close association of the two men was indeed referred to by the Bishop in his address at the conclusion of the dedication service that was held in the pretty chapel. Before this the treasurer of the hospital, Mr. J. G. Wainwright, had spoken of the value of the services Sir Henry had rendered the hospital in his long association with it. The brief but hearty ceremony took place in the presence of a congregation composed largely of nurses, members of the hospital staff, and persons attached to the Doulton establishment. Others present included, besides the treasurer, Mr. Shand, Mr. Mills-Thorne, Mr. Ridley, the Hon. Mrs. Talbot, Mr. Ballance and Mr. Currey, the architect of the hospital, the Rev. G. Weigall, the Hospitaller, and the Rev Andrews Reeve, rector of Lambeth. The panels, which are characteristic of Mr. Tinworth's best work, represent three scenes associated with the Ascension of our Lord.

TRADE NOTES.

THE new schools, Arlecdon, Cumberland, are being warmed and ventilated by means of Shorland's patent Manchester grates, patent exhaust roof ventilators and inlet tubes.

WE have received from Mr. Harry Steuber, of 12A Watling Street, some samples of his "Chin-Chin" and "Pelican" drawing-inks. They are of excellent colour, and possess the virtues of working freely and equally and of drying quickly. Their price, too, compares favourably with that of most of their competitors.

THE heating of the two new co-operative stores and assembly room, Crewe, and the residence of Mr. Joseph Shaw, Moss View, Hollinwood, are to be heated by Spencer's patent "Ventilo" radiators, the patentee and sole maker of which is Mr. W. F. Spencer, Crossbank Works, Oldham, and 145 Queen Victoria Street, London, E.C.

IN the ventilation of the Featherstone Board schools, Yorkshire, Cousland's improved "Climax" patent direct-acting turret ventilators, design "F," have been used, supplied by the patentees and manufacturers, the "Climax" Ventilating and Heating Company, Limited, 93 Hope Street, Glasgow. The same company are also supplying, for the ventilation of Prestwick Conservative Club (architect, Mr. James A. Morris, Ayr), their Cousland's improved "Climax" patent direct-acting invisible roof-ventilators.

WE are asked to announce that the two businesses of Hendry & Pattisson, of 4 Marlborough Mews, Oxford Street, heating and ventilating engineers, and makers of "D. O. Boyd's" patent warm air grates and stoves, and E. Farrar & Co., late of 69 Berners Street, W., casement makers and art metal workers, have been amalgamated and incorporated under the Companies' Acts, and will henceforth be carried on jointly under the style of Hendry & Pattisson, Limited. The works and offices of the company will be at 4 Marlborough Mews, Hills Place, Oxford Street, London, W., to which address all communications should be sent. We are informed that Mr. John Hendry will be the managing director, and Mr. Pattisson and Mr. Farrar have also joined the board. This is evidence that both businesses will receive the care and attention of those who have the largest stake in them.

WE have received from Messrs. Maughan's Patent Geyser Company, Limited, one of their handy little instruments, which forms at once a rule, a compass and a paper knife. As the

companying sketches show, it is a very simple little affair ich can be manipulated with the utmost facility. In its rmal condition it is a paper-knife on which a rule is printed, ile by placing a pin in one hole and a pencil in another,

rves or circles of various dimensions can be formed. This ndy little instrument will be sent on application to the com- ny at 51 Queen Victoria Street, E.C.

BUILDING AND BUILDERS.

E foundation-stones of the new St. Edmund's Roman tholic Church, Little Hulton, Walkden, were laid on the h inst.

ARRANGEMENTS are being made for a westward extension the church of St. Margaret, Prestwich. It is proposed to ke such an addition to the building as will accommodate r 100 persons. The estimated cost is about 1,600*l.*

IT has been decided to build a new parsonage-house for the ish of Norden, near Rochdale. At present the incumbent compelled to live in a house outside the parish, and at a nsiderable distance from the church. A site has already en promised.

THE erection of a diocesan Church-house in Liverpool l be begun shortly, and the first section is expected to be npleted before the close of the year. The cost of this rtion is estimated at 15,000*l.*, and the cost of the whole at 000*l.*

THE foundation-stone of a church to be erected for the new ish of St. Joseph, Tranmere, was laid on the 19th inst. The v church is situated at the corner of North Road and llowbank Road, Devonshire Park. It will provide accommo- ion for 600.

AT the fortnightly meeting of the Worksop Board of ardians, Mr. Sydney Smith presiding, the principal siness was the motion by Mr. T. Warner Turner in favour erecting a new workhouse, as against the proposal to erect infirmary only on the site recently purchased for 1,100*l.* The opposition was led by Mr. C. Moore, who proposed that only the infirmary be erected. A long discussion took place, and eventually the amendment was carried by nineteen votes to twelve.

AT last week's meeting of the Grimsby Corporation highways committee plans were submitted for the development and extension of Lord Heneage's estate, near the park, and including the making of streets upon the site of the present Grimsby Town Football Ground. The plans were passed, and a deputation appointed to ask Lord Heneage to make a subway under the Great Northern Railway. The chairman said that he had heard on good authority that 400 houses would shortly be erected in New Clee upon the land between Wellington Street and Clee Lane.

THE new billiard-room at the Builders' Club and Stone Exchange, Keighley, was opened on the 11th inst. with a ceremony, at which the mayor (Alderman C. H. Foulds) and a large company were present. Mr. Joseph Green has presented a full-sized Orme table, and the furnishing of the room has been paid for by voluntary subscription amongst the members. Mr. R. Tomlinson formally asked acceptance of the table on behalf of Mr. Green, who could not be present. The first game was played between the Mayor and Mr. John Clayton, of Cullingworth, with the result that His Worship won by 100 points to 58. Alderman Foulds also delivered a suitable speech.

AT Edgbaston, Birmingham, thirteen large villa residences are in course of erection. Each house has three reception-rooms, large kitchen, &c, seven bedrooms, bath-room, linen-closet and all the conveniences required in a superior class of house. At Sheldon, about five miles from Birmingham, six commodious villas have been completed. At Knowle, about nine miles from that city, a number of very conveniently-arranged cottages are being erected, to open up a building estate of about six acres in extent. The whole of these buildings are Gothic in style, and are being erected by various contractors. The architect is Mr. John Statham Davis, of Cobden Buildings, Corporation Street, Birmingham.

VARIETIES.

MR. SYDNEY PERKS, architect and surveyor, informs us that he has removed from 13 Waterloo Place, S.W., to 5 Crown Court, Cheapside, E.C., and that his new offices are over Sir John Bennett's premises.

THE new bridge erected across the Kilmarnock Water as an access from High Street to the Kay Park was formally opened on Saturday afternoon. It will no doubt prove a great convenience to residents in the upper end of the town.

CULCHETH CHURCH, Newton Heath (Methodist New Connexion), which has been closed since January 15 for repairs, decoration, &c., was reopened on Sunday. The organ has been greatly extended and improved. The cost of these decorations and alterations will probably reach 800*l.*

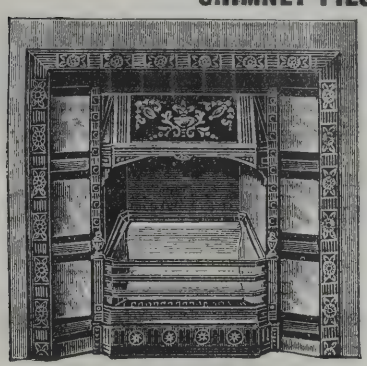
MESSRS. FREDK. BEESLEY & SON, civil engineers, of 11 Victoria Street, Westminster, have taken into partnership Mr. H. Bertram Nichols, A.M.Inst.C.E., F.G.S., of Grosvenor Chambers, 59 Corporation Street, Birmingham, their respective practices being amalgamated under the style of Messrs. Beesley, Son & Nichols.

BROOMHILL Free Church Hall, Randolph Gardens, Partick, was opened on the 16th inst. The church proper has not yet been built. The hall, however, is large, and is intended to serve the purposes of a church for some time. It is seated for 400 persons, and has, so far, cost 1,250*l.* Ground has been reserved for the erection of a church when needed.

TWO immense hospitals are in course of construction in Berlin—the Charité and the Städtisches Krankenhaus; the former with 1,247 beds, the latter with 1,650. The Charité, with its offices, outbuildings and gardens, will cover an area of nearly 50 acres; the Städtisches Krankenhaus 27 acres. The building and equipment of the Charité will cost 500,000*l.*, that of the Krankenhaus 660,000*l.* The Charité will have a pathological-anatomical institution in connection with it which will cost 80,000*l.* to build and equip.

ON one of the towers of Blair Castle there has just been placed a minaret from the Mahdi's tomb. This memento was brought home from the Soudan by the Marquis of Tullibardine, D.S.O. It consists of copper plates riveted together, and bears several bullet marks received at the bombardment of Omdurman. The base of the minaret is cone-shaped, and is 13½ inches in diameter. A stalk 3 inches in diameter rises from the cone and tapers to the top. Halfway up is a ball about 8 inches in diameter, and the stalk ends in the shape o a dervish's spear. The total length is 3 feet 10 inches.

THE new public hall which has just been erected a Bearsden, N.B., occupies a prominent site in the district, at th corner of the Drymen Road and a newly-opened stree adjacent to the Free church. The hall, which measures 70 feet long by 43 feet broad, accommodates fully 600 persons inclusive of a small gallery which is placed over the entrance lobby at the east end of the hall. There are two committee o retiring rooms attached, which, being divided by a movabl glass partition, can be used as a small hall if so desired thereby seating fully 100 people. The exterior of the buildin is designed after the Scottish baronial style, having stone skew on the end gables and coronals on the upper floor windows The entrance is by an arched doorway fronting the Drymen Road, over which is a two-light window, with circular ornament over the same. The walls are built of white freestone and the character of the work is square-dressed rubble pointed with Portland cement. The architect is Mr. Alex. Petrie, I.A. Glasgow.



THE FURNISHING TRADES EXHIBITION.

"DO you see the figure in that piece of wood, sir? That too the Almighty centuries to paint. You, with the vandal goug of the wood-butcher, have ruined it in as many hours." Thes words of an American critic kept ringing in our ears wit painful persistency when we paid our "duty call" some day ago to the "Third Annual Furnishing Trades Exhibition (an Market)," as it is grandiloquently styled. "Exhibition" veritably is—of mediocrity!—and "market" it is in th generally accepted sense of the word. There some 200 o more exhibits are arranged for the edification of all beholders scores of stands crammed with furniture whose existence is du to what?—simply to the determination of the majority of peopl to ape that which they cannot possibly afford. That the manu facturers of these goods are wholly to blame would be to much to contend, but that is not the point to be discussed a the moment. We must recognise the fact that 90 per cent. o more of the furniture upon the market at the present time made to pander to the prevailing taste, or rather lack of tast for vulgar display; honest construction and refinement a minor considerations in the minds of those reponsible for it, they exist there at all.

Imperial Buildings, Ludgate Circus, London, E

Should any objection be raised to the foregoing dictum, a ır of inspection round this exhibition would be quite sufficient answer it. We simply find there manufacturer after manu- ıturer vying with all competitors to give the greatest show the least money, and "cutting lines" are the order of the y. Of course, there are some strivings after "style"—ıt goes without saying. Nondescript creations in "dark ıhogany" are "Chippendale" (*vide* catalogues). Could any- e mistake them? Anything else in mahogany—not "dark"— s time—with satinwood inlay is "Sheraton." Poor Sheraton! ıd worse than all, bad as that "all" is, comes the "Louis" rle, a bastard caricature of the ugliest phases of the most based French Rococo, than which no age nor country has er produced a greater abomination, for to do so is impossible. s, the "vandal gouge of the wood-butcher" reigns supreme, ve where the marquetry cutter steps in; and we should hardly nture to say which is preferable, bad inlay or the worst of vood-chopping." It would seem that a cabinet, sideboard or ermantel is not judged nowadays by beauty of proportion or rfection of craftsmanship. They go for little, and in their ıce we have nails and glue, holding together (for a time!) kety structures whose only object is to support as many velled plates, "carved"—what a desecration of the word!— nels, spindles and shelves as can be crowded upon them.

So much for the greater part of the productions on show the Third Annual Furnishing Trades Exhibition. Yet all is ıt of this class; indeed, there is evidence, small but never- eless encouraging, of improvement upon those of previous ars. There are exhibits—and, curiously enough, most of them me from the provinces—which make it perfectly clear that we ve in our midst brains to conceive and hands to carry out rniture as irreproachable in design and construction as the ost hypercritical could desire. The British cabinet-maker ı, when the opportunity is afforded him, hold his own with his ethren in the craft the world over; but how seldom does that portunity arise. Certainly there is all too little evidence of existence in the contents of the Royal Agricultural Hall st now. No, the craftsman cannot, if he would, put his best ork into the "jobs" that come into his hands; every detail ust be "cut" to the very lowest; "new designs," which are t designs at all, must be brought out every week, or oftener possible; the "existing demand must be supplied," and so we on to confusion worse confounded.

These furniture exhibitions serve one good end at least; ey show to what the furnishing of our middle-class homes has sunk, for the small percentage of excellent work that does chance to find its way there is but as "a drop in the bucket," throwing the paucity of the rest into all the greater contrast. It is only just to say that the management and organisation are admirable, and we know that commercially these displays are a success to most of those concerned. Is it too much to hope, then, that in years to come the artistic standard prevailing shall become such that in our reviews praise rather than reproach shall predominate? May the day be soon.

ELECTRIC NOTES.

THE Burton-on-Trent Town Council propose to borrow, amongst other sums, 11,000*l.* for electric-light extension purposes.

THE Stirling Police Commissioners have received the sanction of the Secretary for Scotland for the borrowing of 25,000*l.* for electric-lighting purposes.

SOUTHAMPTON is now lighted by electricity, the mayor switching on the current for the first time on the evening of the 13th inst. in the presence of a large number of spectators. The Corporation has also taken over the tramway service at a cost of 50,000*l.*, and intends to supersede horse by electric traction.

THE Manchester County Council finds itself under the necessity of applying for power to borrow half a million sterling, in order to keep pace with the demand for electricity for lighting and motive power. The installation, which is in its fourth year of working, has thus far absorbed some 357,616*l.*, standing second in that respect to Liverpool, which has spent 523,368*l.* But whilst the last published returns for Liverpool show an output of 2,187,594 units sold and the equivalent of 135,322 lamps of 8 candle-power, Manchester's latest accessible returns show 3,434,850 units sold and the equivalent of 183,408 lamps.

AN extraordinary escape from death has occurred at Charlotte, North Carolina. An electrician named Owen was occupied installing an electric plant there, and in doing so had to work a Westinghouse generator. His arm came into contact with a live wire, the shock of which drove an electric current of 1,500 volts through his body. He was thrown a distance of 20 feet and fell unconscious, and it was thought his body must certainly be lifeless. But in half an hour he had fully recovered his senses. The occurrence is remarkable, seeing that the electric current used in executing murderers is

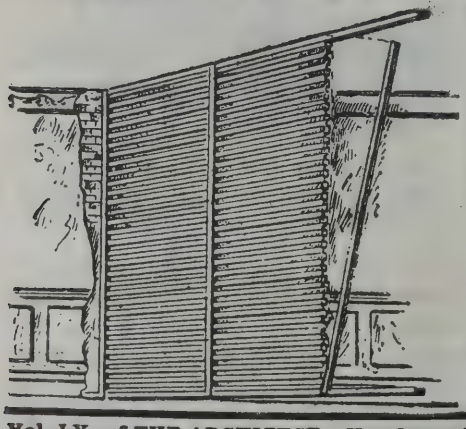
LX. of THE ARCHITECT. Handsomely bound in Cloth. Price 12s. 6d.

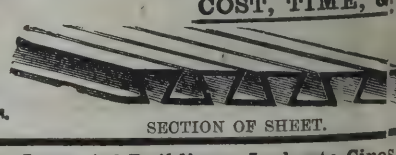
1,800 volts, which was reckoned to leave a margin, and still make death an absolute certainty.

AT a recent meeting of the electric lighting committee of the Leith Town Council it was resolved to reduce the charge for power to 1¾*d.* per unit, in place of 3*d.*, formerly fixed. The demands have been such as to warrant this reduction. With regard to the charge for lighting purposes, the committee fixed upon a scale of discounts to large consumers, which will be immediately advertised. Recently conferences have been held with a committee of the Dock Commission on the question of lighting the docks, and in the special circumstances the electric lighting committee expressed their willingness to give energy at the rate of 1⅛*d.* per unit, subject to certain undertakings on the part of the Commissioners; but it was reported to the meeting that no reply had yet been received to that offer.

THE MATCHLESS GAS-LIGHTING SYNDICATE.

SOME few weeks ago we had to speak in commendation of the automatic gas-lighter which is being introduced to the public by the above-mentioned syndicate, now acting in combination with the Welsbach Incandescent Gas Company. It was in celebration, as it were, of the amalgamation and the opening of new offices that a demonstration of the efficiency of this ingenious invention was given yesterday at the aforesaid new offices in Queen Victoria Street, and naturally a special feature was made of it in combination with the Welsbach Company's mantles, and in this connection we may say a few words in elucidation.





The "Machebach" gas-lighter, as the new instrument has been christened, is provided with an arrangement carrying a "pilot igniter," which, although inside the glass shade, is always outside the mantle. When this new fixture has been attached to the incandescent fittings, the double-seated valve is so constructed that in its normal state that portion which affects the burner proper is closed, while that connected with the pilot igniter is open. Thus, as soon as the gas is turned on, either at the meter or the bracket-tap, it will pass into the pilot igniter, and rushing through a very minute hole comes into contact with the igniting agent. This agent is composed of a simple arrangement of platinum and chemically-treated porous block, and is known shortly as the "lighting pill." It is bound round with three or four platinum wires, which concentrate at the minute hole in the pilot igniter before mentioned. The action of the carbonetted hydrogen upon the "lighting pill" causes this latter to glo and the platinum wires to assume a white heat or inca descence, which ignites the gas issuing through the ho just referred to, and the igniter is thus lit, but so far th main valve is still closed. As, however, the heat from th small jet is communicated to an upright metal rod (sheathe for protection with porcelain) which runs up some 2 inche alongside the jet, this rod expands, acts on the valve leve and gradually allows the gas to flow through the main burn into the mantle, which ignites without the least puff, saving the mantles. The extra heat on the rod finally clos the pilot valve, extinguishing the igniter, whose work is no finished. The whole operation is completed and the mantle in a space occupying from six to ten seconds. The constru tion is simple and effective, and all the several parts are inte changeable. The apparatus, which effectually supersed the bye-pass, is simple in construction, and owing to a the parts being interchangeable they are easily renewe at a small cost. The lighters have, it is said, been p to severe tests both here and on the Continent for a perio extending over eighteen months, and their efficiency is pract cally assured by the fact that both the English and Germa (Welsbach) incandescent companies after lengthy trials hav adopted them in conjunction with their burners.

PHŒNIX PLATES IN FIREPROOF CONSTRUCTIO

IN view of the terrible conflagrations which from time to tim horrify and alarm us, any invention which seems to promi us immunity from, or at any rate mitigation of, the terrors a loss occasioned by fire is to be cordially welcomed, and th being so we were pleased to witness a test from which new building material, to be known as Phœnix plate successfully emerged on Wednesday last. In these plat simplicity and efficiency seem to go hand in hand. The mat rials of which they are composed are simple, and obtainab everywhere. They are mixed with the requisite quantity water, and the mixture is spread on a level table in a mass the requisite size and thickness. In about ten minutes t plate is ready to be lifted off and taken to the dryin sheds. The plates dry in racks in a drying-shed for two or thr weeks, or in the open air, according to the season of the ye The plates have an important property in their lightness, bei considerably lighter than water, and about the same weight

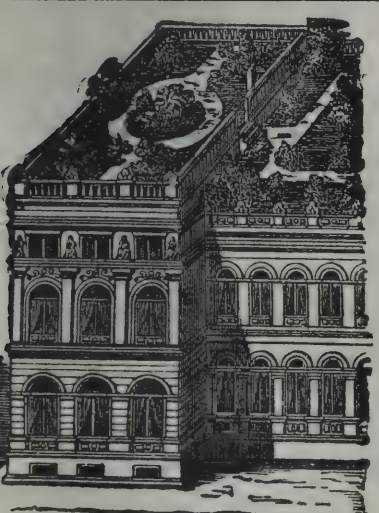
SECTION OF SHEET.

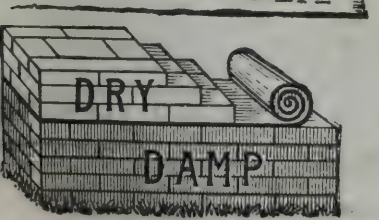
ome of the hard woods. A ceiling of this material is said to e quite as cheap as an ordinary lath-and-plaster ceiling, esides being fire-resisting. In putting the plates together to orm ceilings, they are simply nailed to the wooden joists, and little ordinary plaster cement is used to fill up the joints. wo men can fix 1,000 square feet of ceiling-plates in position a working day. Partition walls may be built in an exeditious manner, the plates being simply built on edge and eld together by small wrought-iron coupling-pieces where artition-framing is not used. The ceiling or partition walls eing perfectly dry when fixed, no time is lost before finishing iem with plain cement or paint or paper. This is a considerble advantage when compared with the ordinary plaster walls nd ceilings usually constructed.

The means adopted for the test were as follows:—A avilion of two chambers was constructed, the plates forming alls and ceiling; above these a chamber formed entirely of ood and having a wooden floor was built; this was approached y a wooden external staircase. In one of the lower chambers ood impregnated with tar, &c., was stacked and ignited, and a aring fire was speedily in progress, but, notwithstanding the eat engendered, the wall of the adjoining chamber showed no gn of increased temperature, and remained perfectly cool to ie touch, while neither the stairs nor the room above were in ie slightest degree affected by the heat, nor did the applicaon of water from a fire-hose affect in any way the stability of ie structure. In short, the test terminated in a result on hich the inventor may well be congratulated.

BRITISH EXPANDED METAL.



VE recently had occasion to refer to the opening of the xtensive premises of the British Fire Prevention Committee, of hich Mr. Edwin O. Sachs is the indefatigable chairman, at anover Gate, Regent's Park, and the object of the establishment f which is to obtain reliable data as to the exact fire-resistance f the various materials, systems of construction or appliances sed in building practice. The aim of the first of these tests hich took place on February 15 was to ascertain the fire-esisting merits or otherwise of a floor by the Expanded Metal ompany, Limited, London, and to record the effect of a nouldering fire of fifteen minutes' duration, of a temperature not exceeding 600 deg. Fahr., followed by a fierce fire of one hour, gradually increasing to a temperature of 2,000 deg. Fahr., followed suddenly by the application for three minutes of a stream of water, and the consequent rapid cooling.



The area of the floor under investigation was 100 feet superficial in the clear (10 feet by 10 feet). The floor was loaded with 140 lbs. per square foot. The time allowed for the construction and drying of floor was three months (winter), and the result of the test was that the plaster ceiling below the floor remained intact until the application of water. There was a slight deflection of floor and ceiling. The concrete of floor was slightly and superficially cracked. The fire did not pass through the floor. The chamber was constructed of stock bricks, with lime mortar, and measured 10 feet by 10 feet internally. The ceiling of the floor tested was 7 feet 6 inches above the pavement of the chamber. The hut was roofed in with galvanised iron. The door opening on the south side measured 2 feet 6 inches by 6 feet 6 inches, and was closed by an iron sheathed wooden door. The fuel used was gas produced at the station, and the supply was regulated by valves and dampers. The gas was admitted through two mixing chambers of firebrick, each 10 feet by 3 feet super, as shown. Two Roberts-Austen pyrometers were used for recording temperatures, the first to take a continuous record and the second to take four observation records. The load was of pig-iron distributed evenly on the surface of the floor.

The system adopted for construction of the floor tested was as follows: On November 14, 1898, three rolled steel joists, 6 inches deep, 3 inches wide, 14 lbs. per foot, were put across the chamber. They ran north to south and rested on the 4½-inch set-off. The two outer joists were placed 1 inch from the east and west walls respectively, and the third was placed in the centre, making the distance between the centres of the three joists 4 feet 9½ inches. Provision for air was made by cutting holes 4 inches by 4 inches between the floor and ceiling in the exterior walls.

On November 16 three wooden bearers were put up in each bay, 3 feet 4 inches centre to centre, by 6 inches deep, 2 inches thick, and covered with 1-inch boarding, as centering. On the top of the centering and covering three-quarters of the entire surface of the floor expanded metal was laid, of the kind known as 3-inch mesh, ¼-inch by ⅛-inch strand; at the centre the metal overlapped 18 inches. At the north-east corner a quarter of the area was covered with ¼-inch by $\frac{3}{16}$-inch metal, same mesh as before.

PATENT
VULCANITE ROOFING.

Since the introduction of the patent Vulcanite Roofing into this country it has been adopted by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospitals, Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summer than under any other roof. When properly laid repairs are never required, and all roofs are guaranteed. The roof-surface can be used as a garden, or for any other purpose The cost of construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGES, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to 40 inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower and quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and for SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 superficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires no annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.

OLD FORD, BOW, LONDON, E.

Inquiries from the North of England, Scotland, and Ireland, please address to Laganvale, Belfast.
Agents wanted in all districts where not yet represented for laying of Vulcanite Roofs and Sale of Sheet Asphalte.

Vol. LX. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered. Price 12s. 6d. Office: Imperial Buildings, Ludgate Circus, E.C.

On the same day the concrete floor was put in. The cement used was Portland. It was not specially selected for this test, but was delivered in the ordinary course of business The furnace ash (or cinder) came from gas works at Bank Hall. One cubic yard of furnace ash (or cinder) broken up small enough to pass through 1½-inch ring was placed on a platform prepared for the purpose, and then covered with four sacks of cement, each sack containing two bushels. The material was turned over three times dry. The concrete was then divided into four equal parts for convenience of mixing, and one part mixed at a time The quantity of water used was 58·18 gallons for the whole, and the concrete was well mixed The concrete was then carried in pails on to the centering and laid over the entire surface, great care being taken to have the meshes of metal well filled. The concrete was trodden down or beaten with the flat side of an ordinary shovel. The concrete was put in 3 inches thick.

On the same day (November 16) while the concrete was still damp, one half of its upper surface (west side) was covered with ½ inch cement and sand in equal proportions, similar cement being used as for the concrete. The sand was good, sharp, unwashed pit sand. On the following day (November 17) the remaining half of the floor (east side) was covered, the same proportions of cement and sand being used. The total thickness of concrete and cement was 3½ inches.

On November 28 the centering was taken down.

On November 30 the expanded metal for the ceiling was put up. Bars ⅞ inch by ¼ inch thick were placed at right angles to and below the joists, 12 inches centre to centre, supported by steel clips 3-32 inch thick by ¾ inch wide, which were secured to bottom flanges of the joists. The expanded metal was then secured to bars with steel clips. The metal lathing used for the ceiling is known as ⅜ inch mesh, 3-32 inch deep in strand, Siemens-Martin steel

On December 5 the ceiling was plastered with coarse stuff, ½ inch thick, below the expanded metal, the materials being mixed in the proportion of 1 of lime to 2 of sand with about 1 lb. of dry, long, well beaten hair to every 3 cubic feet of coarse stuff, the coarse stuff being brought ready mixed on to the ground.

The weather report during building operations was "unsettled with rain". On the days on which the concrete was laid and the ceiling plastered, *i.e.* November 16, 17, and December 5, the weather was fair. the temperatures being respectively 48 degs, 50 degs. and 55 degs. Fahr.

On December 6, the floor having been completed, the roof was put on. From December 6, 1898, until February 14, 1899, the floor remained with door and all ventilation holes open.

In December the weather was unsettled with rain and gales. The rainfall for the month (taken at Camden Square) was 2·54 inches, with a maximum of ·87 on December 6. The maximum temperature was 57·1 deg. Fahr., and the minimum 27·1 deg. Fahr. The number of nights with a temperature below 32 deg. Fahr. was three.

On December 27 (evening), during a violent gale, the roof of the hut was blown off and the floor flooded with rain. The roof remained off until the morning of December 28, when it was refixed. It was found that the water had soaked through the floor and ceiling, making the ceiling very wet. From December 28, 1898, to January 3, 1899, the weather was very stormy and wet. No artificial drying was employed.

In January 1899 the weather was unsettled with rain and gales. The rainfall for the month was 2·52 inches, with a maximum of ·46 on January 15. The maximum temperature was 56·2 deg. Fahr., and the minimum 28·1 deg. Fahr. The number of nights with a temperature below 32 deg. Fahr. was six.

In February the weather was unsettled with rain.

On February 14 the gas was lighted in the hut at 1.30 P.M., and kept very low until the test began. The roof was removed in the afternoon. The floor was loaded with pig-iron, equal to an evenly distributed load over the entire floor of 140 lbs per square foot.

On Friday 15 the test was undertaken. The following is the log of the test :—

At 2.40 P.M. the floor and ceiling were intact. At 3.25 P.M. vesiculated water vapour from the evaporation of water remaining in the concrete commenced to rise from above the concrete on the south side. At 3.55 P.M. evaporation showed itself strongly from all over the floor. From 3 10 to 4.10 P.M., at ten minutes interval, the surface of the ceiling was viewed from the observation hole. No change in the floor or its ceiling was observed. At 4.10 P.M. the gas was shut down and the door opened. The ceiling was intact. A slight deflection of the soffit was observed. From 4.13 to 4.16 P.M. a jet of water was applied, the pressure ranging from 40 to 20 lbs, gradually decreasing. On application of water to the ceiling, the portion of the plaster struck immediately fell down—the portions not touched remained in position. From 4.10 to 4.25 P.M. the temperature rapidly decreased. At 4 25 P.M. the test was

losed, the floor, excepting for the plaster referred to, remaining ntact.

Observations After Test.—On February 16 two photographs ere taken of the floor from below. Some fine cracks in the nderside of the concrete are observable from these. On ebruary 16 the deflection of the centre joist was measured nd found to be 1⅜ inch at the centre of joist. The eastern joist as deflected 5-16th inch at centre. The western joist was not ffected. On February 21 the iron load was removed. Some ne cracks were observed in the cement surface of the floor. hey did not penetrate the coating of cement. On February 23 general photograph of the ceiling was taken from below, and kewise a photograph of the floor from above. On February 24 he floor was further examined, and it was found that the fire ad not penetrated the floor at any point. No further observaions were made.

SHOREDITCH PUBLIC BATHS.

ON the 18th inst. the opening ceremony in connection with the aths and washhouses for the parish of St. Leonard, Shoreditch, as performed by Mr. James Stuart, M.P. Mr. E. J. Wakeling, e chairman of the baths committee, presided. The vestry of horeditch several years ago set itself the task of solving the ifficulty of how to utilise the house refuse and at the same me dispose of it effectually. The result was that a very large cheme was decided upon, namely, the erection of a dust-estructor, the provision of electric-light plant, a free library, nd extensive baths and washhouses A site was obtained in itfield Street, Hoxton, with frontages to Coronet Street and owling Green Walk, and the whole of the buildings have been rected here at very great cost. The dust is destroyed, and the eat thus obtained is used to drive the electrical machinery and or the purposes of the baths and washhouses. There is othing wasted, and so far the experiment has been a great uccess. The first-class swimming-bath is 100 feet long by o feet wide, and the second 75 feet by 35 feet. There are rivate slipper baths for fifty persons, and the main bath rovides seating accommodation for 600 persons, the dressing-oxes being collapsible, so that when an entertainment is going n they form a panelling for the walls. The whole of the ttings are of the most elaborate kind, and the smaller bath is tted for use as a gymnasium in the winter. The estimate of the committee is that by the system of heating adopted a saving of 1,400*l.* a year for coal will be made.

THE GENERAL STEAM NAVIGATION COMPANY.

THE General Steam Navigation Company announce their usual excursions to the Continent for the coming holidays. The departure for Ostend from Irongate and St. Katharine's Wharf (Tower Bridge) will be at 2 P.M. on Wednesday, the 29th inst., and at 3 P.M. on Saturday, April 1, returning from Ostend on Tuesday, April 4, at 11 morning. Through tickets to Brussels and back will be issued as usual For the convenience of excursionists the regular departure for Hamburg *via* Harwich on Wednesday, the 29th inst., will be postponed until Thursday, the 30th, at 8.40 P.M., returning from Hamburg on Sunday, April 2 (instead of Saturday, April 1), so that passengers may be due back in London, Liverpool Street, early on the morning of the 4th prox. The sailing for Bordeaux will be on Saturday, April 1, at 2 P.M., returning from Bordeaux on Sunday, April 9, at 2 morning, calling as usual on the way back at Southampton, where holders of London return tickets have the option of landing.

WORKMEN'S COMPENSATION ACT, 1897.

ON the 18th the appeal in the case Wood *v.* W. Walsh & Sons came before the Court of Appeal. It raised a very important question affecting a large class of workmen, says the *Times*—whether the Workmen's Compensation Act, 1897, applies to painters engaged in painting the outside of a house by means of ladders; that is to say, whether the employment is on, in or about a building which is being "repaired" by means of a "scaffolding" within the meaning of section 7, subsection 1, of the Act. The appeal was from the decision of Judge Greenhow, sitting at the Leeds County Court, upon a case stated by an arbitrator appointed to settle a claim for compensation under the Workmen's Compensation Act, 1897. The claim was by the widow of a deceased workman who was killed while in the employment of the appellants, Messrs. Walsh & Sons, who were painters and decorators at Leeds. The deceased man was at the time of the accident employed with

several other men in cleaning and painting the outside of a house over 30 feet in height at Leeds. The work was being done by means of five or six long ladders, and consisted of removing the dirt and blisters, making good the woodwork with putty and the stonework with hall-plaster or cement, and afterwards painting the surface. Nothing was being done to the building except preparation for painting and the actual painting. The deceased man was standing upon the rung of one of the ladders, which was resting against the wall, engaged in puttying and painting, when the rung of the ladder broke, and he fell to the ground and was killed. One of the workmen at work had placed a plank with one end resting upon and tied to the rung of one of the ladders and with the other end resting upon a window-sill, and stood upon this plank to work, but the deceased man had not used this plank. The claim for compensation was referred to a barrister as arbitrator under Clause 2 of Schedule II. of the Act, who held that the building was not being "repaired" within the meaning of section 7, subsection 1, of the Act, and that neither the ladders nor the arrangement of the plank resting on the ladders and the window-sill were "scaffolding" within the meaning of that section. He accordingly held that the deceased was not killed while engaged in any employment within the Act, and made his award in favour of the employers, but submitted two questions of law for the decision of the County Court judge—(1) whether the building was being "repaired" within the meaning of the Act; and (2) if so, whether it was being repaired by means of a "scaffolding" within the meaning of the Act. The County Court judge reversed the decision of the arbitrator upon both points, and awarded the claimant an agreed sum of 237*l.* 18*s.* The employers appealed. By section 7, subsection 1, of the Workmen's Compensation Act, 1897, "This Act shall apply only to employment . . . on, in, or about any building which exceeds 30 feet in height, and is either being constructed or repaired by means of a scaffolding, or being demolished. . . ."

Mr. C. A. Russell, Q.C., and Mr. Clarke Hall, for the appellants, contended that this was not a building which was "being constructed or repaired by means of a scaffolding" within the meaning of section 7, subsection 1, of the Act of 1897. In so far as these were questions of fact, the arbitrator had decided them in favour of the appellants, and an appeal only lay from him on a question of law. First, this was not "repair." The Act spoke of repair by means of a scaffolding. That was an indication of the kind of repair intended—namely, repair of a structural character and not mere decorative work. It could not be said that merely whitewashing or painting a house was doing repairs to it within the meaning of this Act. Secondly, the repairs, if any, were not being done by means of a "scaffolding." The ladders were clearly not "scaffolding." Nor was the arrangement of the ladder and the plank "scaffolding." The arbitrator found as a fact that it was not If it were, a plank resting on two ladders, which painters frequently used for whitewashing the ceiling of a room, would be a "scaffolding." Even, however, if this arrangement of plank and ladder could be called a scaffolding, it did not follow that the building was "being repaired by means of a scaffolding," only a small part of the work being done by means of the scaffolding. Because one workman chose to put a plank from the ladder to the window-sill, for his own convenience, that did not bring every workman engaged on the building within the Act. Supposing there was a scaffolding at the back of the house used by bricklayers for repairing that part of the house, and painters were employed by the same master in painting the front of the house, the latter would not be employed in repairing the house by means of a scaffolding. They submitted that the decision of the County Court judge was wrong.

Mr. Robert Wallace, Q.C., and Mr. Horace Marshall for the claimant, contended that the work the deceased man was engaged on was "repair" within the meaning of section 7, subsection 1. "Repair" meant the restoration of the building to its proper condition as fit for use and occupation. There might, perhaps, be painting of such a purely decorative character as to be outside any meaning of the word "repair." But here there was making good the wood and stone work, and painting the outside to keep it from decaying. There was a restoration of the fabric of the house. The ordinary covenant to repair and keep in repair would include work such as this, so as to keep the woodwork in proper condition. Therefore the building was being "repaired" within the meaning of the Act. Secondly, the ladders used in the work constituted a "scaffolding" within the meaning of the Act. The word scaffolding was used in this Act in its popular sense, and included anything used outside the building for the purpose of repairing it. The suitability of the thing for the purpose was the test. Again, if the ladders were not "scaffolding," the arrangement of plank and ladder was. A small platform hoisted up the front of a house by means of ropes and pulleys, which painters frequently used for painting the outside of a house, would come within the term "scaffolding" in the Act. So also would the arrangement

the plank resting on the ladder and the window-sill. The ecision of the County Court judge was therefore right. If this nd of employment was not within the Act, the effect would be shut out a large class of workmen from the benefits of the ct.

The Court allowed the appeal.

Lord Justice A. L. Smith said that the argument had been equently pressed upon them that if they decided a particular se in a certain way a large number of persons would be cluded from the Act. They had power only to construe the ct. But this he would say—that it was clear upon the face the Act that every workman was not brought within the ct, but only certain classes of workmen, and the rest were ft outside. The question was whether this case came within e Act. The deceased man was engaged in painting the utside of a house. Ladders were used for the purpose. On he ladder there was a plank with one end tied to the rung of e ladder and with the other end resting on a window-sill. he deceased man was not working on that plank. He was a rung of one of the ladders, when the rung broke, and he ll and was killed. There could be no doubt that the Legisla- re, when they passed the Act, knew well what was conveyed the terms "ladder" and "scaffolding." There could also e no doubt that they knew what was conveyed by the terms painting" and "repairing." Though in some respects section 7 ight be a most difficult section to construe, in the present case e (the Lord Justice) did not see the difficulty. Was this house being constructed or repaired by means of a scaffolding" within e meaning of section 7, subsection 1? First of all, was it being constructed or repaired"? It clearly was not being "constructed." Was it being "repaired"? The word "repaired" did not, in his pinion, include the mere painting of the outside of the house. he arbitrator had found as a fact that nothing was being done the building except preparation for painting and the actual inting. Ordinary painting was not repairing. If the Legis- ture had intended to include it, they would have said so in ain language. On the contrary, they had used language hich was plain and clear—"constructed or repaired"—and ose words did not include painting. Next, as regards the eaning of the word "scaffolding." Was the ladder a scaffolding" within the meaning of the Act? Who in his nses would speak of repairs done by means of a ladder as pairs done by means of a scaffolding? Here, again, if the egislature had intended it, they would have said so. They ld confined the case to repairs by means of a scaffolding. A ladder did not come within that term. It was then said that the arrangement of the plank and the ladder converted the thing into a scaffolding. That seemed to him to be a question of fact, and the arbitrator had found that it was not a scaffolding. He was not going to attempt to define what was or was not a scaffolding, as he could see that they would have many appeals brought before them raising the question what was or was not a scaffolding. The deceased man was therefore not employed on, in, or about a building which was being constructed or repaired by means of a scaffolding within the meaning of section 7, subsection 1, of the Act, and therefore the claimant was not entitled to compensation under the Act.

Lord Justice Collins and Lord Justice Romer agreed.

CORRESPONDENCE.

Directions to Workmen in Sewers.

SIR,—The county borough of Salford's "Directions for Dealing with Foul Gas in Sewers," recently published in the *Architect*, with Mr. Corbett's covering letter, form a fitting opening for the inevitable annual sewer-gas discussion, more especially as they demonstrate the necessity of a complete change of view on the part of our public health authorities before this important question can receive a satisfactory solution.

Direction No. 1 says:—"Open the lids of two adjacent manholes so as to provide a downcast and an upcast shaft," &c. This is good as far as it goes, but it is one thing to "provide" a downcast and upcast shaft and quite another to be sure that they will "act" as such. Sometimes this procedure would be adequate enough, at other times it would not, but men's lives should not be subject to any condition that is not absolute as far as up-to-date sanitary knowledge goes. The remaining directions (Nos. 2 to 7) clearly recognise that No. 1 is not to be relied upon.

Directions Nos. 2 and 3 suggest a means by which an upcast and downcast movement may be produced, namely, by a shower of water. These directions carry protection very much farther than No. 1, but are still short of sufficient protection. Some sewer fatalities have occurred where the manholes by which the men entered the sewer were perfectly fresh at the time they entered, and the length of sewer they had traversed quite wholesome, but volumes of fatal gases coming

in in the meantime from other parts of the sewerage cost the men their lives. Such a case as this is not covered by directions Nos. 2 and 3, and this is most important, for it is not a usual thing to find the air dangerous throughout a large section of sewerage The real danger is more often a movable and moving quantity, and a point of the sewerage may be quite safe at one time and dangerous at another, after even a comparatively short interval.

Directions Nos. 5, 6 and 7 are admirable from the point of view from which they are given, but what a lurid light do they throw upon what the sewerman's lot must be until this point of view be changed.

Direction No. 6 especially ought to be reprinted in large letters, and posted in every council-room in the kingdom, until the present state of matters gives place to a better. It reads thus :—"When a man has to descend a risky manhole or shaft, he must have a strong rope properly tied about his shoulders, so that he could be lifted by it, and the ropes must be kept in hand ready to lift him up if he becomes overpowered by the gas. When a man has to crawl along a risky sewer he must have a short rope securely tied to his ankles and a rope from it to the hand, so as to draw him back if he becomes overpowered by the gas."

Mr. Corbett may be regarded in a sense as standing sponsor for these directions, and his known ability and experience only serve to give a more pronounced colour to the gruesome picture which they give of the present practice of dealing with gas in sewers. Is it justifiable that a man should have to "crawl along a risky sewer" as provided for in this direction?

It is not, for the simple reason that it is unnecessary. Let it be understood that I am not criticising these directions as such. Humane motives are obviously at the back of this endeavour, and such undoubtedly was Mr. Corbett's motive in sending the directions to you for publication. But I feel bound to insist on this, that no sewers should ever be in a state in which it is necessary for a man to "crawl along with a short rope securely tied to his ankles, and a rope from it to hand, so as to draw him back if he becomes overpowered by the gas," that is, probably with his mouth under the sewage during the process of drawing back. The idea is too revolting, but that such a thing is possible under the present system cannot be doubted, and the county borough of Salford, recognising this, have made provision for such an actuality in their direction No. 6.

The more widely the real state of matters is known, the sooner, one may reasonably hope, will the proper remedy be adopted. The remedy is a very simple one, namely, to provide for the perfect ventilation of sewers at all times and under all the varying atmospheric conditions. This, by the Reeves system, has been proved at Sutton, Epsom and many other places to be a practicable and economical remedy. And not only will sanitary authorities banish all possibility of such special horrors as are contemplated in the Salford directions by adopting this remedy, but they will thereby insure for their constituents that better health which the purer air they would thus be enabled to breathe in their streets and houses would bring them. There is no more insidious and pernicious de-vitaliser of urban air than the impurities of organic origin which emanate from town sewers, not in summer alone, when they are recognised by their foul smell, but also in the winter, when their presence is not so readily observed.

Hoping you will find space in your valuable Journal for these remarks, I am yours, &c., WM. BROWN.

THE WEEK.

E District Surveyors' Association has sent a petition to House of Commons against the London Government l. It states that nearly all the district surveyors of ndon are members, and that their official, personal and vate rights and interests, as well as their ability to dis-rge their duties in administering the Building Act, will very materially and prejudicially affected if the Bill omes law in its present form. There are sixty-five rict surveyors in London, all being virtually independent utory officers, but there is an appeal against their require-nts. In the Bill it is proposed to authorise the transfer n the London County Council to the Borough Councils such powers as may be agreed upon between the respec- councils. It is also proposed that the committee of Privy Council shall make a provisional order determining ch of the powers under the Building Act are to be rcised by the County Council and the Borough Councils. e petitioners most strongly object to the powers sought be conferred on the Borough Councils, as they would stitute a serious hindrance to the district surveyors in discharge of their duties and a danger to the public rest. The Building Act deals with matters common to whole of London, and is therefore more efficiently uniformly administered by the central authority the district surveyors. Were the powers under Act transferred to the Borough Councils, the district veyors would no longer be able to carry out the ies of their offices in the same just and fearless and partial way as heretofore. The Borough Councils will quently contain builders and owners of property whose vate interests will be at variance with the duties now charged by the district surveyors under the Building , and should the appointment, control and dismissal of rict surveyors be transferred to the Councils, it will nifestly be very difficult for a surveyor to enforce the visions of the Act against a member of the Borough ncil, who may use his influence to procure such sur-or's dismissal, or to prejudice him in his official capacity. e transference of the powers from the central authority umerous local bodies will also militate against amend-nts of such Act being made as occasion may arise. It lso submitted that the Bill contains no provision for the tection of the district surveyors, and they consider that clauses which affect their rights and interests should be ck out or be so amended as to give the necessary tection, and that provisions should be inserted to pre-t the Borough Councils having the power of appointment, trol and dismissal of the surveyors, and that no power uld be granted which might cause interference with the vers, privileges, duties and emoluments of the surveyors hey at present exist. Although exercising independent trol, the district surveyors have carried on their duties ler the supervision in many important respects of the ndon County Council and its predecessors. The office superintending architect was created to check the rges of district surveyors. Under the Borough Councils re would be no such general and uniform supervision. iformity of administration would be destroyed, for in hands of the central authority an evenness of adminis-ion of discretionary power is secured which would be ossible in the hands of a number of local authorities, would each exercise the control in their own way spective of what was done in other parts of London. petitioners, in conclusion, ask to be heard before committee as opponents of the Bill.

THE inconvenience of sixty-five officials who are charged the enforcement of the Building Act cannot be expected ount for much with the promoters of the Bill for the vernment of London. It is also remarkable that the nty Council do not attack the Bill on the lines laid out he District Surveyors' Association, and apparently do not sider they are of much account. Changes in the ad-istration of the Building Act, which would involve the creation of a class of surveyors who would devote all their time to their official duties, have been often proposed and found support with practising architects in the Metropolis. The Government may still consider such an arrangement to have many advantages, and it was probably within the purview of the draughtsman of the Bill. Then it will be said that the proposed Borough Councils will not be made up of owners of dangerous structures and of insanitary property or speculators in jerry buildings, but of representatives who will support the district surveyors. The grievances of the surveyors, we suppose, will be treated as arising from the apprehensions to which all officials are liable whenever there is an alteration in the laws relating to their duties. But there is a possibility of danger to the public interests when there is no apparent provision for a uniform interpretation of the clauses and schedules of the Building Act. The Privy Council may be able to do much with provisional orders to insure uniformity, but apparently the subject is considered too unimportant to engage the attention of those who are responsible for the Bill, and the opposition depends on financial rather than on technical administration.

THERE have been many greater landscape painters in England than BIRKET FOSTER, who died on Monday night at Weybridge, but it may be doubted whether one existed who was so popular, especially with the inhabitants of towns. He gave a suggestion of the country and country folk that corresponded with the notions of those who could not have much experience of fields and villages. His figures were as idealised as his trees, but there was no disputing their charm for all who were not realists. He was born in 1812 at North Shields, where he was unable to observe many varieties of English landscape. He served his time to the LANDELLS as a draughtsman and wood-engraver. His work was noticed by Mr. INGRAM, the founder of the *Illustrated London News*. In that journal and some of the publications of the same house he obtained the scope for the display of his talent which he had desired. His views of English watering-places and of village scenes rejoiced Londoners. Then he was offered endless work by the publishers of books. GILBERT and FOSTER practically possessed a monopoly of the illustrations which were published during several years. Both were mannered, but the public thought only of their excellence. BIRKET FOSTER also made drawings for chromo-lithography, and it was but a short step to water-colour art. His drawings were always considered successful. The critics were occasionally severe in pointing out their shortcomings, but the artist was always certain to find patrons. He went to Scotland and to various parts of Europe in quest of subjects, but whatever he drew was reminiscent of England as FOSTER saw the country. He was conventional, but the public always retained an affection for his works. BIRKET FOSTER induced many people to take an interest in landscape, and for that reason he should be held in remembrance.

THE MYLNE family have been long associated with Edinburgh, for the important office of King's Master Mason was one of their privileges. In the last century one of the members came to London, and he and his descendants were associated with several architectural and engineering works. ROBERT MYLNE erected Holyrood Palace in 1672. His name is also more plainly connected with Milne's Court and Milne's Square, &c. The square is shortly to be demolished, as it interferes with the improvements in the High Street. But according to Mr. R. S. MYLNE one little memorial of the past will remain, for when Mr. T. M'LACHLAN, the architect, a few years ago rebuilt the south-west corner of Milne's Square, in the Scottish baronial style, as offices for the National Bank of Scotland, he was careful to preserve the ancient stone with the arms and initials of the founder, and the date 1689, and let it into a protected portion of the new wall. Though much effaced by the lapse of time, the arms, initials and date are yet distinguishable, and remain as a permanent record of the past for those who have eyes to see and minds to care for the interesting antiquities of Edinburgh.

B

COMMERCE AND ART.

OF late years it is the custom of most nations to employ some of their young diplomatists to report on subjects which relate to commerce. International contests are no longer confined to men who bear arms. The increase of trade, although due to civilians, is as important a victory as one won in the field, although there may be less romance about the struggles. The commercial bureau of a country therefore resembles the military bureau or intelligence department, although the application of the knowledge gained may be less direct in the former case. But while so much information is gathered from remote quarters by official reporters, it is remarkable how little is said about the commerce with works of art. Not only paintings and statues, but an immense variety of other productions come under that head, and consequently as a branch of industry art has an importance which is not apparent to all. In the foreign trade of France the works of art sold abroad are represented by large sums. Artists now find it is an advantage to visit America periodically. They can secure commissions, sell works for which a market was not found in France, and derive information which they utilise afterwards for their own and their friends' benefit. Italy at one time was able to derive much profit from the sale of works of art in foreign lands, but the world has become too critical to be satisfied with the productions of Italian studios. There has been a prejudice against German art in England, but it does not affect opinion elsewhere, and in Munich, Berlin, Düsseldorf, artists readily acknowledge that a part of their income is obtained from abroad. If statistics could be prepared it would be found that England has derived less profit from art out of strangers than any of the countries we have mentioned. Frenchmen, Germans and Italians do not buy English works unless under exceptional circumstances. Occasionally works are sent across the Atlantic from London, but they do not find such welcome as those coming from France.

It is no explanation of the difference to say that Frenchmen, Germans and Italians take more pains to meet the requirements of a foreign market than is usual with Englishmen. That sort of accommodation is only applicable to the humblest classes of works of art. What is sought by foreign buyers is that every work should be so characteristic of its producer as to be recognised at a glance. To have a picture that appears to have been prepared for a ducal gallery in England is a triumph for the owner, because it suggests he fought a battle against odds and won it. Frenchmen and Germans treat New York as if it were one of the home markets. As John Dryden said, "the pencil speaks the tongue of every land," and it will be a long time before any discourse in Volapuk becomes as eloquent as a well-painted picture. The true cause why English works have not a commercial value is the want of organisation. Dealers, no doubt, charge a very high percentage for their services in disposing of the works of men whose reputation is not universal. But if the fees are heavy, the labour which they reward is not always trivial. Frenchmen and Germans submit to exactions in a philosophic spirit, but English artists prefer to see their pictures become dim and old-fashioned against studio walls rather than dispose of them at what is an inadequate price. They may understand their business better than an adviser. However, the sight of the products of unremunerative labour cannot be cheering to the workman, and the question is whether an inadequate reward is not preferable to having evidence around one of inability to please.

The "higgling of the market" must always sound as an odious phrase to an artist. It places divine gifts on a level with the humblest things. The buying and selling of beautiful objects with all the sordid accompaniments of the huckster is as old as art itself. The trade has been from time immemorial one of the agencies which has helped to civilise the world. Commerce no doubt began with an exchange of goods that were needed for existence. But as the savage to-day is fascinated by cheap jewellery or finery, so it was in an early age. As time went on, there was a desire to have things of higher value, and as supply and demand are always correlative, such things were produced and carried to remote regions, there to exert a beneficent influence.

We see in what the Prophet says about Tyre and its benc of ivory, fine linen with broidered work, blue and pu apparel, chests of cedar, emeralds, coral, agate, diamo topaz, beryls, and the multitude of rich merchandise, a tributing agency which corresponded with the desire of peoples of distant lands to display wealth in dress the adornment of houses. Their commerce represented stage in civilisation. But the Tyrians were likely to included among the Phœnicians, who, as a part of world became more advanced, were able to supply not jewellery and apparel, but works in the precious metals sculpture in marble, wood and clay. Phœnician ag appear to have known every artist and to have utilised t with profit. They also were acquainted with the mean reproducing the works of one country in another w labour was cheaper. As well as can be made out, supplied models to the Greeks, and we may assume that were too shrewd to be surprised when they found the p went beyond their teachers.

The Greeks also were merchants and owned ves When in our days it is considered necessary to have ing forts to protect merchantmen, we are simply imitati Greek precedent. Their men-of-war were of use invading and compelling people to pay tribute, but ostensible object of the navy was to guard comm What were the Greek exports? The soil was not ductive, and what it yielded was insufficient for consum at home. To be independent of foreign supplies for was an instinctive desire with the Greeks, hence the of supervision of the slaves engaged on farms, and belief that "the best nation is a nation of farm Although in the Golden Age men could be satisfied what was yielded by the ground they owned, other req ments followed with time. The Greeks could not be to the necessity which seeks for something more th little bread and a few olives, and which has to be obta by barter. As Heeren says, they knew that in ord live they must have productive arts, but they never sidered it was the object of life to be occupied with arts. They preferred to depend on the labour of sl while they discoursed about liberty. There was no lo caste in possessing a manufactory so long as the owner tented himself with drawing the profits. Demosth owned a sword-cutlery establishment which he had herited from his respectable father, and where he empl thirty slaves. It would have been considered bad ta he had spoken about the processes employed in it number of blades which were turned out yearly. information would now be prized, but the Greeks not anticipate a time when hand labour would be sidered to be dignified. The orator possessed also a stead manufactory with twenty slaves at command. An orator named Lysias manufactured bucklers, where was found for 120 slaves. The Greeks were silent their industries, and all that can be said on the subj administration has to be derived from inference.

We have no reason to suppose the goods manufac whether swords, bucklers or bedsteads, were int solely for home markets. The ships which came imports to Athens were not likely to return in b There must have been an exchange, and, as is preference would be given to goods which were pro in Athens or Attica. In that class the most importa characteristic would be works of art in various forms. conclusion usually drawn from what is recorded Greek art is that the artists were not inspired by the of making money. It was their ambition to have ex of their works in some public place where they wo enduring evidence of the genius of their creator patron was supposed to be no less unselfish, and ever he purchased a work was expected to h over to the State. We cannot suppose that the w every artist's works were tacitly claimed by the auth although the rule would apply to some which were c interest. Long before Greece was invaded the fame artists had spread among neighbouring peoples, an only reasonable to conclude that the esteem in wh men were held was not entirely based on hearsay ev Many artists are credited with no more than a few Can we suppose they spent the remainder of their l idleness? It is likely they worked also for foreign p

whatever was exported was no more recorded in the onal annals than the swords and bedsteads which were larly turned out for the customers of DEMOSTHENES. thens had not a large business in exporting works of re cannot realise the use of ships, or how the incomes obtained by which the State was upheld. Probability is in favour of the conclusion that Athens nbled Paris in at least one way, namely, in the pro-ion of varieties of works of art. The outlay on build- statues and paintings would then be easily understood, n addition to the impression of the greatness of Athens h was made by them on the people and on strangers, orks would form an academy for the benefit of artists. believe famous Greek sculptors, painters and metal-ers were not ashamed to dabble in commerce with own works, and, if so, English artists need have no ving about the shoppiness of making arrangements foreign agents.

STAFFORDSHIRE AND SUFFOLK.*

ONDON is so vast, its inhabitants can only consider themselves as units, and they come and go as if they so many snowflakes or particles of dust. One occa-ly, therefore, without much surprise encounters e who were supposed to have passed away, but who nue to be well and hearty. A volume of the "Gentle-Magazine Library" affords a similar experience. To t the most interesting communications which were from the old Clerkenwell publishing office was a thought, which gratified archæologists. But owing manner of publication there are few ordinary readers ould be able to say what has been the fate of the ment. Have the volumes appeared at regular als, and in what order? As well as we can remember, st volume we noticed related to Devonshire; now we before us a volume on Staffordshire and Suffolk. We if any of our readers can have seen the intervening es, and who knows whether the springing from the ing to the close of the alphabet may not be a feat of ological agility? The activity is, however, misplaced, e are afraid is not calculated to make an interesting successful.

ffordshire is more important for its industries than for hæological remains. One of its captains was JOSIAH WOOD. In 1794, when one of the correspondents of *ntleman's Magazine* visited the works at Etruria, the s life was nearly ended. In describing "the inimit-orks" it is said:—"We see here a colony newly raised sert, where clay-built man subsists on clay. The forms hich this material are turned are innumerable, and v behold this exquisite composition not only ornament-e ceilings and chimneypieces of Mr. WEDGWOOD'S ouse, but many others in the county." This is ce that the potter was honoured in his own country. artner BENTLEY, who was also a benefactor to the , receives no attention. Another friend of WEDGWOOD AMES BRINDLEY, the engineer, who believed rivers reated for the purpose of feeding modern canals. ed at Turnhurst, in the parish of Wolstanton. A ondent, writing in 1811, said of him:—"This extra-y man, though originally in humble life and circum-, by his superior genius and industry was enabled ly to benefit his country, but to acquire an ample . Some of his relatives and descendants now live near Wolstanton parish in great respectability and ndence." Staffordshire, it must be owned, has not d England with many great architects or engineers. WYATT, who gained enduring notoriety by his ions, was the son of a farmer and timber dealer in Constable, but not one of "Mr. URBAN'S" corre-nts was able to discover anything about him or his But his mangling of Lichfield Cathedral could not iven by Staffordshire antiquaries. That building beyond most others at the hands of "fanatic " A correspondent of the magazine writing in pplied the following tradition of the vandalism:—

When the civil war broke out the nobility and gentry garrisoned the Close, and defended it against the Parliament army under Lord Broke and Sir John Gell; the former, a virulent fanatic and enemy to cathedrals, raised a battery in the street called Dam Street, and early in the siege, while standing under a porch directing the bombardiers, he was discovered, from the battlements of the lady choir, by a deaf-and-dumb gentleman named Dyott, who, levelling his musket at him, the ball glanced on the lintel of the porch and entered his eye. (The spot where Lord Broke stood is still distinguished by a pavement of white pebbles, and the lintel through which the ball passed is now preserved in Mr. Greene's valuable museum. The descendants of Mr. Dyott now reside at Free-ford, about a mile and a half from Lichfield.) Notwithstanding the loss of the general, Sir John Gell continued the siege, battered down the central, large and beautiful spire, and within a month the garrison surrendered. As this seems the first cathedral that was seized, after a long and obstinate resistance, the rage of civil war was then let loose. The roof was entirely stripped, the carved work, monuments and statues were destroyed, and the church used as a stable for the troop horses. In the course of the war Prince Rupert besieged the Close again, and, understanding the art of war better than the former besiegers (who attacked the strongest instead of the weakest part), he raised his batteries in Gay Field, a rising hill north of the church, and which overlooked the whole Close, and made the garrison submit on the second day of the siege.

After the Restoration Dr. JOHN HACKET, who was rector of St. Andrew's, Holborn, was made Bishop of Lichfield. On the morning after his arrival he began the Herculean task of cleansing the cathedral. Then he applied to every gentleman in the diocese and to visitors for aid, and by his energy succeeded in raising the enormous sum of 23,000*l.* for the works. The restoration being completed, we are told that he gave "three magnificent entertainments, the one for the dean and chapter and all the members of the cathedral and clergy of the diocese; one for the gentry; and one for the bailiffs, aldermen and corporation." The bishop did not long survive the accomplishment of his task.

Suffolk was more fortunate in the time of the civil war. Ufford Church alone appears to have suffered. But Puritanism was not the only destructive agent. The tower of St. James's Church, Bury St. Edmunds, in 1819 collapsed through the vibration of the bells. A correspondent wrote:—"Soon after a peal had ceased, a considerable portion of the grand arch on the east side of the gateway suddenly fell down; the fallen stones fortunately separated from their long abode without injury to any person, but it caused much alarm. The part which fell is the arch springing from the capital of the third column, of which there are four on each side. About thirty of these large stones, which are at once the ornament and support of this noble arch, were in a moment displaced." An earlier correspondent relates the discovery in 1772 of the coffin of the Duke of BEAUFORT, uncle of HENRY V. The body had not decayed. We are told that "the workmen coming early the next morning resolved to make a prize of the lead, and therefore cut out the corpse, tumbled it into a hole near at hand, and threw the dirt on it. The lead was conveyed directly to the plumbers and there sold for twenty-two shillings. Thus, in SHAKESPEARE'S phrase, was a great man knocked about the sconce with a dirty shovel."

Another correspondent found the church bells of East Bergholt in a wooden cage on the ground. He said his landlord told him they were disgraced and imprisoned "from having been rung on the Pretender's birthday," but the writer believed there was no authority for the assertion. At Keddington, a writer says, one of the rooms of the ancient mansion of the BARNARDISTONS is hung with calico hangings with figures as large as life. It is supposed they were imported by a member of the family who lived in Turkey. From Market Weston we have an account of a method of straightening walls, which is more often referred to in books on natural philosophy than adopted by architects:—

The north wall of Market Weston Church has been restored to a perpendicular position by a successful application of science. This church is supposed to have been erected in the fourteenth century; in 1630 it was injured by lightning, and again ten years since it was much shattered by a thunderstorm. The time had now arrived when it became necessary to effect a perfect restoration, as from age and the above-mentioned

e Gentleman's Magazine Library. Edited by G. L. Gomme, English Topography. Part XI., Staffordshire—Suffolk, F. A. Milne, M.A. Elliot Stock.

casualties the north wall had declined outwardly 19 inches from the perpendicular, and threatened the utter destruction of the building. Under the superintendence of Mr. Cottingham this wall (the weight of which had been calculated at 240 tons) has been brought up to the perpendicular by the process of expanding by heat three bars of iron 2½ inches in diameter, which traversed and connected both walls of the church. These bars (which had screws worked on one end of them and projected beyond the south wall) were enclosed in cast-iron boxes filled with lighted charcoal. When the bars were fully expanded by the heat, the screws were wound up firmly to the undamaged south wall. The charcoal boxes were then removed, and the process of cooling commenced. Gradually the bars, contracting equally with their previous expansion, compelled the whole mass of the wall to follow the irresistible power now exerting itself, and in four successive operations the whole wall rose to its original perpendicular. The whole operation does infinite credit to Mr. Cottingham, who adopted the like means at Armagh Cathedral.

There are many communications in the volume which are no less interesting. The *Gentleman's Magazine* was hospitable, and found room for observations and interrogations by tyros in archæology. In the eighteenth century England was not so generally known as it is now, and many were as glad to read the descriptions in the Clerkenwell oracle as they are now when the subject is some remote land. The classified collections edited by Mr. Gomme contain the most valuable parts of the old magazine, and are worth the appreciation of English archæologists.

THE SCOTTISH ARCHÆOLOGICAL PUZZLE.

We have already recorded some of the incidents connected with the discovery of the piled structure beside the Clyde at Dumbuck. Several letters and communications have appeared in the *Glasgow Herald* on the subject. The evidence has been summed up by Dr. David Murray, who says :—

The works are on the northern shore of the Clyde, about fifty yards above ordinary low-water mark, and about 6 feet under water at ordinary tides. The surface soil of the shore here and for a considerable distance all round consists of fine clay. The site is about 1,800 yards east of Dumbarton Rock and about 1,000 yards west of Milton Isle, a small island on the north side of the Clyde, a little to the west of Dunglass Castle. At this point the channel of the Clyde was formerly filled with a hirst or shoal of hard gravel, which extended from Dunglass on the east to the spot where the finds were made, a distance of about one mile and a quarter. The depth of water on this ridge, as determined by John Golborne in 1768, was only 2 feet; at its eastern end at Dunglass Castle it was 24 feet, and about as much at its western end. A ford, known as Dumbuck Ford, crossed the highest part of the shoal about midway between Milton Isle and the site in question. This ford is shown upon Kyle's large plan of the Clyde, dated 1800, belonging to the Clyde trustees, and is transferred in pencil to a sheet of the Ordnance Survey in their office. The road leading from the shore to the village of Dumbuck or Puddockhole formerly turned westwards along the shore, a distance of about 330 yards, to a hard spit, where it crossed the river and fell into a road on the south shore a little to the east of Bishopston House. Mr. Kyle states that in 1800 the ford was passable only at very lowest water, by which he probably meant low water of spring tides, and it became altogether impassable about 1825 by the continued operations of the Clyde trustees for deepening the water.

The shoal at Dumbuck was for long one of the principal obstacles to the navigation of the Clyde. So far back as 1556 an attempt was made to remove it, and 200 years later, in 1758, the Corporation of Glasgow were authorised by Act of Parliament to carry on deepening operations from Dumbuck upwards. So shallow was the river in several places—and Dumbuck was the worst—that, as the Act recites, "boats, lighters, barges or other vessels cannot pass to nor from the city of Glasgow except it be in the time of flood or high water at spring tides." The terminal limit of the Corporation's power seawards was marked by a cairn on the north shore opposite the edge of the Dumbuck shoal. This cairn is shown on a longitudinal section of the Clyde in "The River Clyde," by Mr. James Deas, the engineer of the Clyde Navigation Glasgow, 1876.

The Structure.

The structure consists of a circle of stones about 180 feet in circumference. Immediately within this there is a ring of oak piles, scarcely rising to the surface, and only discovered by digging. About 10 feet within this ring there is a circle of piles with a flooring of cross poles, apparently of firwood, betw them. Two of these rows lie north and south, and a t between them east and west. Over and around this platf there was a large quantity of loose stones, small boulders coarse shingle. A causeway of similar stones stretches the platform to the shore in a somewhat zigzag course. heavy piece of oak timber, with five holes in it, like foot r as if to form a ladder, was found buried in the clay. A re heap of bones was found on the south-east of the outer and the canoe on the north side, within a sort of dock.

The piles are thus described by Mr. Donnelly (*Gla Herald*, January 27, 1899) :—"They measure about 6 feet and 3 feet from the point are 'faced,' the facets being very examples of stone-axe work. When the labouring of the was finished the point was scorched or 'browned' with The point driven into the blue clay strongly resembled the of a lead-pencil when nicely sharpened with a rather lo point." Dr. Robert Munro, on the other hand, says that of the timbers "bore marks of a metal axe."

The canoe is hollowed out of a single oak tree, a similar to several of those which have been found in adjoining the bed of the Clyde at various times. It is, ever, the longest of them all. It is broken at the end, still 33½ feet long and about 4 feet broad. Lying inside were found a spearhead-shaped object of slate, similar to found in the fort, and an oyster-shell perforated as suspension.

The refuse heap contains a great quantity of bones ox, pig, sheep and other animals, and antlers of the red roe deer and fallow deer. Several of the bones are spli pointed, as if for use as tools or utensils. Some of the a appear to have been used by man, and some of them have neatly sawn round and nearly through and then broken instrument of stone or metal capable of sawing anythin found either here or at the fort until recently, when a known gentleman picked up at the shore structure a fra of flint, which he thinks could be used as a saw.

In addition to the bones and antlers, there have been in and about the structure (1) several of the spearhead-s objects of slate, some of them ornamented with incised herring-bone and other oblique-lined patterns, similar objects found in the fort, and figured in the "Proceedi the Society of Antiquaries;" (2) a small knife-shaped p cannel coal or shale, with incised female figure; (3) s charms and amulets, with rayed ornaments and ho suspension; (4) fragments of cannel coal unworked; (5) s flat perforated stones, some of them apparently sinkers, smaller and lighter.

The Object of the Structure.

In considering the object of the structure it is observed that if the Corporation lower cairn of 1758 occupy this very spot, it stood upon the same line and it. There are, however, no remains of such cairn. S therefore, with the fact that there was a cairn, the natu clusion would be that the remains now discovered belo To support a cairn of the size required in such a situat to prevent sinking it is not unusual to provide a pla wood resting on piles. Fascines are often laid up platforms, and in the present instance a great deal wood was found on and about the platform.

The object of the Corporation cairn was no doubt the limit of their jurisdiction, and also to serve as a b vessels coming up the river. For this purpose it w placed near low-water mark and close to the edge of th Such a beacon may have been erected long prior to 1 may have been one of the works of 1556 or of 16 another attempt was made to form a passage through t Beacons have often a pole in the middle rising a stonework and surmounted by a cross. Such a pol down to the bottom would probably be sunk in the cl would produce a hole or well-like cavity similar to th formation of the Dumbuck structure.

The canoe and the other finds suggest however, it that this was an ancient and not a modern work, and, explanation may be that the Corporation found the existing in 1758, and took advantage of it, added to it it as a cairn and beacon. But be this as it may, if the is an ancient one, what was it? It has been assume question that it was a crannog or lake dwelling, simila found in many lochs and loch bottoms in Scotland an but there is considerable difficulty in accepting this v

Lake dwellings are of two kinds—the pile dwe the crannog proper or artificial island. A pile d simply a platform laid on piles similar to a modern or pier, with a house on it. A good illustration of t structure appeared in the *Illustrated London* February 4. A crannog was a solid structure of cro piles and brushwood built up from the bottom of the raised to a sufficient height above the water level to being flooded. To retain the wood and light m

on it was often loaded with stones. As it consolidated it and had to be added to from time to time to keep it able. It was generally connected by a gangway or cause- with the shore, often laid a few inches under the water, so prevent its being seen, and zigzagging, to make it difficult stranger to follow it. This access was often a kind of roy laid upon piles, but might be a stone road. On the ce of the crannog, and, of course, far above water level, was, as a rule, a hearth. One or more canoes have been in connection with several of the Scottish and Irish ogs.

hearth, it is said, was found in the middle of the Dum- structure. "On the raised stone-paved mounds," Mr. elly writes, "rosetted round the central well-like cavity, nce of fire was found" (*Glasgow Herald*, February 4, 1899), he has explained that several hearths were found outside rcle.

is accordingly claimed that there are here everything that tutes or indicates a crannog—(1) a wooden platform sur- ed with piles and stones; (2) a connecting causeway; arths, and (4) a canoe.

he obvious difficulty in accepting this theory is that the rm of a crannog and its hearth stood above water, not at ottom of the lake or river. That the level of the land on umbuck shore is the same now as when the piles were n and the flooring laid does not admit of doubt. At a e date there was an elevation of the land, but there has no subsequent depression. If there had been a depres- and the structure in consequence brought under water, ssumes that it was erected above high water, and it could erefore have been a crannog. If, on the other hand, it rought to its present level by an elevation of the land, the ust originally have been at a depth always below water, would have rendered the construction of the platform cticable and a hearth an impossibility. Assuming then, must, that the work was constructed when the level of nd was what it now is, the platform cannot have been the platform of a crannog or the circular well-like cavity of rth.

he platform may no doubt have been the foundation of a of stone island with a dwelling on the top. Pliny (H.N.) states from personal observation that the Chauci, a g and seafaring people, who dwelt between the Ems and be, lived on artificial eminences constructed in the tidal , which were left dry or nearly so at ebb tide. Dr. Munro Lake Dwellings of Europe," page 443) drawn attention tructure of this kind near the island of Eriska, at the of Loch Crerar. It is circular, 60 feet in diameter, dry and submerged at spring tides to the extent of 5 feet. sists of a substratum of wood with a cairn of stones above, nether it was a human habitation is not certain.

the case of the Dumbuck structure the central portion could have been loaded; the outer ring of piles, where was no platform, was doubtless intended to prevent wash, e space between the two rings was probably covered with stones, as a kind of apron, and not as part of the building. ase of the cairn could not be more than 30 or 40 feet in ter, and if the cairn was pitched, as would be necessary dal stream, and had a batter of 1½ to 1 and a height of t, it would come to so narrow a point as to be a mere and useless for a dwelling-place.

he canoe is said to have been found lying in a kind of But this creates as much difficulty as the platform. s are not built below high-water mark; a canoe could not ot in such a situation, and if it was it would be of no use. as sunk, a heavy oaken dug-out canoe, unlike a modern r-built pine boat, would, I am told, soon become water- l, and would warp when exposed to the sun. Suppose it t, of what possible service could it be to people on the the mole? At high water they could not get at it; at ater they could go to the shore without it, or if they wished dle in it they would not be able to launch it.

has been suggested that the cavity in the centre of the m may have been a fish tank for the preservation for use of the surplus catch not immediately consumed; but pond at the bottom of the sea is hardly a thing that the men would have thought of.

seems to me, therefore, improbable that this structure was nog or a residence of any kind.

the mouth of the Leven, a short distance below Dumbuck, s a low cairn of boulders, known as the Black Layer; the Bay of Ardmore, a few miles further to the west, re two similar structures, the Big and the Little Layer, n high and low-water marks, and tailing towards the

The tradition of the country as regards the latter is that ere Roman landing places. This may be questioned, but uation of the Dumbuck structure suggests that there may een here something of this description. It is just at the f the shoal. As the canoe is 18 inches deep inside, it not have floated in two feet of water, and must therefore een intended for navigating the deep waters to the west and if its owners lived at Dumbuck they must have embarked and landed just about this spot. It would, indeed, be the most convenient landing place for all vessels that were unable to pass the shoal. At the same time the platform seems more appropriate as the support of a cairn or beacon than as a landing place itself.

The Finds.

The finds have been the subject of much discussion. A considerable number of stones have been picked up, which have been provisionally classed as tools and as palæolithic. So far as I am able to judge, they are naturally-shaped stones, and present no appearance of having been fashioned by man. If they are tools they are certainly not palæolithic. The bones and antlers present no unusual appearances. The ornamented spearhead-shaped objects of slate, the rayed discs, and the piece of cannel coal with the female figure on it are all peculiar, and nothing similar has been hitherto found in Scotland. They have been denounced as forgeries, but I can see no ground for the suggestion, and it is to be regretted that it has been made. Those engaged in the work are above suspicion, and it is very discouraging to them and to other workers to be thus treated. The charge bears improbability on the face of it. It can hardly be conceived that anyone would take the time and trouble required to produce these objects, and on the assumption of forgery it has not been explained how they came to be buried deep in the undisturbed clay of the shore at Dumbuck or in the soil at Dumbowie? The council of the Society of Antiquaries may have been, and probably were, puzzled by the unusual character of the Dumbowie objects, but they treated them as genuine, and gave them a place in their "Proceedings." Sir John Evans, the greatest living authority on stone implements, weapons and ornaments, accepts them as genuine ("Ancient Stone Implements of Great Britain," p. 404, second edition, 1897). That the bones, antlers, perforated stones and plain discs are genuine has not been disputed. Similar stones and discs have been found in many places in Scotland, and are well known to archæologists. The only question that has been raised is in reference to the spearhead-shaped objects and the figured pieces of shale.

SHAKESPEARE AND PICTORIAL ART.

A LECTURE was given by Sir Wyke Bayliss upon "Shake- speare in relation to his Contemporaries in the Fine Arts" before an audience assembled in the house of the late Lord Leighton at Kensington.

The lecturer said critics, scholars, poets, historians, elocutionists had interpreted Shakespeare in their different ways: he came forward as none of these but as an artist to speak a few words upon a matter that had not yet been dealt with. What a picture the title of his address conjured up. The great poet surrounded by the great artists of his day, the studios he visited, the pictures he admired, the painters who were his companions. Religion, philosophy, art were but so many elements with which Shakespeare dealt in picturing human life—his true greatness: the splendour of his genius lay altogether in his humanity. England could claim one poet who stood side by side with the greatest, and in art England had stood side by side with Greece. Shakespeare was not born into a land where there had been none but fighting men and politicians and reformers. There were in Shakespeare's day in England a people great in poetry, great in art, and a court of which it was sufficient to say that it was the court of Elizabeth. But where were the painters? There were none. In the year in which Shakespeare was born Michel Angelo died, and that practically marked the close of the renaissance of art. Roughly speaking, during the boyhood and early manhood of Shakespeare there was not a single painter of the first rank living in the world. It was a little startling, but nevertheless it was true, that Shakespeare never saw a landscape painting. In the year 1600 a new play was entered at Stationers' Hall—"A Midsummer Night's Dream"—and that very year a star slipped from the sky and rested on a little village in the north-east of France. While Shakespeare was writing "A Midsummer Night's Dream" on the banks of the Avon, Claude Lorraine, the first landscape painter, was born on the banks of the Moselle. Shakespeare had no contemporaries in the fine arts, and accordingly he who knew so much about nature knew very little about art in any form. In everything relating to the technique of the painter's art Shakespeare was at fault; in everything relating to his own art, the poet stood supreme lord and master of the human heart; and the fact that this absence of technical knowledge did not lessen the beauty of Shakespeare's work should teach one of the most difficult lessons for the artist to learn—that of modesty. Shakespeare could do without the knowledge that seemed so priceless to others. He had painters enough, his contemporaries—names not necessary to remember, as during the reign of the Georges there were architects enough in

England—men who had everything except genius. Shakespeare knew nothing of art, owed nothing to art, learned nothing from art. In no other of the great poets of the world could they find a parallel case. It was not necessary to prove the exquisite splendour of Shakespeare's vision of the natural world; the curious thing was that his contemporaries in art did not share the vision. It had its fruition later in the rise of a great school of landscape painting.

SURREY ARCHÆOLOGICAL SOCIETY.

THE first annual meeting of the Surrey Archæological Society since the headquarters were transferred from London to Guildford was held on the 25th inst. at the Castle Arch. Viscount Midleton, president of the Society, occupied the chair. The Chairman, having moved the adoption of the report and balance-sheet, and this having been seconded by Colonel Godwin-Austen and agreed to, proceeded to say that the special work which the Society had done during the past year, in addition to putting that house in order, had been the excavations which, under the superintendence of their hon. secretary, Mr. Cooper, had been carried out at Waverley. Those excavations had brought to light a great deal that had previously been unsuspected. They had been met in a very kind and liberal spirit by Mrs. Anderson, the proprietor of the estate, who had relieved them of certain expenses in connection with removing the soil and other things, which would otherwise have fallen upon the Society. But there was a great deal more to be done, and one of the things which they would be asked to do at the end of that meeting would be to authorise a grant of 25*l.* towards carrying out further excavations, from the funds now invested in the names of trustees. There, again, they could find room for a much larger expense, because the ground to be covered was very considerable, and there was no doubt that many other interesting discoveries would be made if they had the funds necessary for carrying out the work. That work could only be effectually carried on during the summer months, because when he was last there, intending to have gone over the ground, he found that it was under water in consequence of the encroachments of the Wey. The site was a low one, and they knew from the ancient records that its former inhabitants, the Cistercian monks, were constantly in trouble from the influx of water during the winter months. Consequently it was only in the summer, during six months of the year, that it could be done. What they wanted was to tax the generosity of the county still further, first, in aid of the remaining alterations and improvements which they would like to carry out in the building in which they were assembled, and to enable the Society to prosecute a really important work in developing what he might call the hidden treasures of Waverley. He thought they might fairly appeal to the county, because they could not claim for Surrey that it was as rich as some other portions of England in archæological remains. But they had in Waverley Abbey a most interesting relic of the past, one with which a great deal of history was mixed up, and the site of which had never been thoroughly examined, since a very considerable portion of it was used somewhere towards the end of last century for building the present house, which was now called Waverley. The old walls of the abbey were recklessly pulled down in order to form a quarry for the building which now stood at a short distance from them. Having referred to the interesting character of the last number of the "Proceedings" of the Society, the President said the more funds placed at their disposal the better it was possible to make the "Proceedings" in the way of illustrations and diagrams. They were now exchanging them with other associations of the same character, and they were gradually forming what he hoped would eventually be a valuable county library bearing upon archæological work not only in Surrey but in several of the neighbouring counties. It was very gratifying to find that the result of the move which had been made to the old county town had been so substantial an increase in the number of members. He hoped the increase would be progressive and that the Society might become what it ought to be, but had never yet thoroughly been, essentially a county Society, in which those who were interested in the county and the many residents within its borders would not only take an interest, but to which they would give an efficient support.

Mr. Giuseppi and the Rev. T. S. Cooper were re-elected hon. secs., and briefly returned thanks. The Rev. T. S. Cooper expressed his thanks to Mr. Malden and Mr. Edmond Foster for their help in arranging the library, to Mr. Henry Horncastle for his help in arranging the museum, and to Mr. Mill Stephenson, who had spent six long days in getting in order the monumental brasses, &c. The Society would always be glad to receive volumes relating to Surrey archæology. As regarded the museum, much yet remained to be done. They had received a lot of gifts, and he had no doubt that, with a little trouble, they would receive many more. Speaking of the Waverley excavations, Mr. Cooper said that was really a mo important work than people might generally think, becau Waverley was the first Cistercian abbey that was establish in this country. He thought they ought to put their shoulde to the wheel to excavate it. He had very little hesitation saying that they had a plan of the whole abbey undergroun and he thought it would be made out so that any mon expended there would certainly be of interest to archæologis beyond the borders of the county, and would, he was perfect certain, do their Society an immense deal of good in the ey of archæologists generally.

Messrs. W. F. Potter and Cecil T. Davis were re-elect auditors, with thanks for their past services.

Lord Ashcombe proposed a special vote of thanks to M Ralph Nevill for his gratuitous services as architect in co nection with the alterations to that building. Mr. Nevill h he said, taken a special interest in the architecture of t county, and the work could not have been in better hands.

Mr. A. J. Style seconded the motion, which was carr unanimously.

Mr. Ralph Nevill, in reply, said as Colonel Godw Austen had reminded him, it was a great many years since took to heart the plan of getting the Society to Guildford. had always been backed up by Lord Midleton, but it too good deal of silent pegging away before they were abl make that move. As they knew, the care of old building that neighbourhood had been a matter of love to him. W one began to deal with an ancient building it was not easy as one might think. Everyone would like to keep it it was, but those whose business it was to deal wit knew that that was not always possible. They had to do w they could, and he hoped that in this case they had not d more than they ought to have done. He spoke with feel because he knew that there were people who would have l things done in another way. They had done their best, he did not think anybody who was not very violently disp the other way would say that they had done any injury to place, but rather that they had brought out the good feat which were not to be seen before. He acknowledged the co-operation of the Town Council and the borough surve The Corporation had found themselves with a bigger bill they expected, but he had not heard of any recriminations, he hoped that they would feel that they had got s thing eventually for their money. He was sure it w be a satisfaction to them to have the Society there.

BRITISH ART SCHOOLS AND AUSTR HUNGARY.

AN interesting and instructive commentary upon national scheme of art education has recently been writes a correspondent of the *Times*, in connection wit exhibition on the Continent of works executed by stude the schools of art of the United Kingdom. Such an exhi is, I believe, without precedent; but the circumstances fully justified the step taken by the Lords of the Commi Council on Education in response to a request from the A Hungarian authorities. Following the practice now h to many continental art officials, M. Radisics de Kutas, d of the Royal Hungarian Industrial Art Museum at Bu visited at South Kensington the exhibition of art school which had obtained medals and prizes in the annual co tion. He was so impressed with the excellence of th exhibition, particularly in the matter of decorative desig his report resulted in a request from Hungary for the lo number of them for special exhibition in Budapest. Th sent of the students who had executed them havin obtained, the works were sent to Budapest at the exp the Hungarian Government.

The following extracts from leading Hungarian new will be of interest as showing the opinion formed of the our schools. One newspaper says:—

"At the present time we see in some of the ro our Industrial Museum such an exhibition as has in us a great desire to recommend it as one worthy o tion to those professors and pupils who are striving the standard of the national taste. We expecte from this exhibition. But what we see to-day excels expectations. We are most favourably impresse the perfection of these works. The general chara of the exhibition is originality. We do not find her iscences of the history of art or variations style. If there were to be an exhibition of the drawin our gymnasia, real schools and industrial institutes, we re vinced that our course of instruction would produ imitations of old styles and spiritless uninteresting works. We wish to accentuate the fact that this exhibi great event, and one which will not soon be repeate English artists, jealous of the ability of foreigners to

them, will not soon again allow our eyes to be opened ich an instructive collection."

nother journal says :—

The exhibition starts with models of heads, busts and s from the antique. To this category belong also the es of foliage modelled from nature and fresco-work. e are followed by models of the human figure and decora- from mould castings. The third section consists of works lief; the fourth contains sketches from antique models ; ifth, sketches from living examples ; the sixth, paintings the life of human beings and animals ; the seventh, of ings of flowers and still life ; the eighth, of monochrome ations ; the ninth, of paper hangings and wrought-iron ; the tenth, of coloured ornaments, book decorations and angings ; the eleventh, of lace and embroidery ; and the h, of wall slabs, earthenware, mosaics, painted glass and indings. Taking the exhibition as a whole it is one of ighest order, and it is evident from it that the English ction in industrial art is the finest in the world, even ing that of the French. They have three grand principles nified simplicity, novelty and practicalness."

t another says :—

The exhibition is exceptionally beneficial to those who are ied in industrial art here, but is interesting and instruc- the cultured public as well. Gradually we shall get to ne beautiful objects of art and learn to depreciate the ese wares and the German articles from Nuremberg. injurious has the German nation been to us in this t? Their manufactured goods have, as it were, sup- d our industrial art. We all begin to see this better and

This exhibition from London (although it be of objects he schools) will prove a powerful incentive in arousing elf-consciousness, which, if thorough, will insure the nce of Hungarian art industry for ever."

e Austrian authorities requested that after the Budapest tion was closed the works should be allowed to be ted in Vienna, where they have been shown under the ntendence of Count Hofrath von Scala at the Imperial m. They are then to be sent to Prague, Bozen and enberg. The most practical sign of appreciation lies, er, in the fact that the Hungarian authorities have ed to purchase thirty of the exhibited works, which are dded to the permanent collection at Budapest.

is is a state of things which should be gratifying to the ts who produced the works, to the art teachers and to epartment of Science and Art ; and the evidence it of the good effected by our national scheme of art ion will be received with pleasure by all who are ted in the art development of our nation.

LY ARCHITECTURE IN WARWICKSHIRE.

paper read before the Archæological Section of the idland Institute by Mr. J. A. Cossins on "Early Archi- in Warwickshire," he said :—Though it cannot be called of architecture, the great monolith, called the king's at Long Compton, is the oldest erection by man in stone ing in the county. Of Roman buildings we have nothing to nothing. The oldest fragments of building remain- e very probably some pieces of masonry in the wing hich crosses the moat at Tamworth Castle and the and second storeys of the central tower of Wooton Church. These are of the kind generally called Saxon, ough the well-known arches of the tower at Wooton have all the most prominent characteristics of that is very probable the church was not built by the great luential Wagen, from whom the place derives its name, Robert de Toner, to whom the Conqueror granted the ery soon after the Conquest, certainly not later than the h century. There are some fragments of wall here re in some of our oldest churches which may be of a rlier than 1066, but it is by no means certain that they ld. There can be but little doubt that for a century or fore the year A.D. 1000 very little building that was not ght and temporary nature had been done, for it was nerally believed that the world would come to an end in r, and in anticipation of the dissolution of all worldly s many wealthy men had made over their lands and to the Church. After the year had passed, with a ble allowance for errors in computation, it is not ig, considering how long church building had been d and how full the coffers of the Church had become, ding in stone began to be general, and that it was n with feverish haste. After the establishment of the power, and during the reigns of the first three kings, ls, monasteries and churches were built in amazing , but the wealth and energy of the nation during the f Stephen were bestowed chiefly on building During his reign there were founded, and either wholly or partially built, at least 1,500 castles, of which 1,150, it is said, were destroyed by Henry III. How all this building was accomplished in about eighty years, if the population was as small as it is generally supposed to have been, must for ever remain a mystery. There is very little doubt that the Saxons, when they built in stone, made copies from the already rude architectural fragments of Roman works, which must have been then very plentiful. But our earliest real Norman work was either done or superintended by masons brought over from the Continent. It was at first rude and simple, with very thick mortar-joints, but very soon improved, and very noble and grand works of extraordinary richness were produced. In Warwickshire we have in Bickenhill Church arcade an example of the ruder kind; in Polesworth an arcade as simple, but better executed; and in Beaudesert and Stoneleigh works of extreme elaboration. Of the 288, or thereabout, churches in the county, about eighty-five have remains of Norman work, but there are many more that are of early foundation of which no remains exist that can be recognised as Norman or earlier; about thirty-five are mentioned in Domesday Book as being then in existence, and it is probable that those belonging to monasteries were not included.

GLASGOW ECCLESIOLOGICAL SOCIETY.

THIS Society met on the 21st inst. in the hall of Woodside Church, the Right Rev. Bishop Harrison in the chair, when a paper was read by Professor Cooper on "The Post-Reformation History of Elgin Cathedral." Professor Cooper pointed out that in Morayshire none of the ecclesiastical buildings had suffered any damage at the time of the Reformation. In the North of Scotland the people were inclined to the old faith, and the churches were as far as possible preserved and maintained. The cathedral gradually fell into a ruinous condition owing to the fact that for long it was not used, and there were none to bear the burden of keeping it in repair. The session records of Elgin were exceedingly interesting, and threw much light on the religious habits and customs of the people. We were able to trace from entries contained in them the gradual decay both of the cathedral and the church of St. Giles, which was the parish church of Elgin. Professor Cooper read many interesting extracts from these records. His paper was listened to with much attention and excited an interesting discussion.

THE PHYSIC GARDEN, CHELSEA.

THE Physic Garden, Chelsea, has been handed over to the trustees of the London Parochial Charities, who have agreed to dedicate a sum of 800*l.* yearly to its maintenance. Under the new scheme the garden is to be administered exclusively for the promotion of the study of botany with especial reference to the requirements of general education, scientific instruction and research in botany, including vegetable physiology and instruction in technical pharmacology as far as the culture of medical plants is concerned. The practical management of the garden will be vested in a committee formed of representatives nominated by the trustees of the London Parochial Charities, the Treasury, the Lord President of the Council, the Technical Education Board, the Royal Society, the Royal College of Physicians, the Society of Apothecaries, the Pharmaceutical Society, the London County Council and the Senate of the University of London. Earl Cadogan and his successors, as representing Sir Hans Sloane, who conveyed the garden in 1722 to the Apothecaries' Company in trust for the encouragement of botany, is also a member of the committee. The garden, which comprises nearly 4 acres, facing the Embankment, was founded about 1673 by the Apothecaries' Company, and held by them on lease until 1722, when it was conveyed to them by Sir Hans Sloane on the trusts already mentioned, with a proviso that, if the conditions were not fulfilled, the land should be held by his heirs in trust for the Royal Society or College of Physicians to carry on the garden for the same purpose. The Apothecaries' Company have recently found difficulty in keeping the garden in a proper state of efficiency, and neither the Royal Society nor the College of Physicians were prepared to undertake the trust on the condition of providing funds for its maintenance. The only course then appeared to be to sell the garden and apply the purchase money on a *cy-près* object, but happily the trustees of the London Parochial Charities have come to the rescue and saved the garden.

Mr. Justice Cozens-Hardy has dismissed with costs the application of the contractor for the municipal buildings at Llandudno, who sought an injunction to prevent the District Council from stopping his building operations because of some contention between their architect and himself. The judge held that plaintiff's remedy, if he had any grievance, was by action for damages, and not by injunction.

NOTES AND COMMENTS.

THE introduction of the cock on the new gold coinage of France as the heraldic emblem of the country is not received with general approval. There is no doubt it has been used for a long time on medals and in various designs. But in most of the large memorials erected since the last war it is the lion which has supplanted chanticleer. In England we claim a monopoly of the lion as of the bull, but when English kings possessed more authority in France than at present, leopards appeared on their standards. Some fastidious Frenchmen are inimical to the cock because it is supposed that his Latin name *Gallus* dictated the choice of the bird as the representative of the Gauls. But if punning heraldry is to be set aside the science would be much circumscribed. The old devisers of emblems were not controlled by the laws of taste which prescribe modern nomenclature. The cock should be preserved if it were only as evidence that Frenchmen at one time were joyous, a quality of which we may now be sceptical. DE QUINCEY several years ago wrote some remarks on the subject. He said:—"The cock, *Gallus gallinaceus*, has always been the symbol chosen and consecrated by the Franco-Gallic people as their true adequate heraldic cognisance. An Englishman pauses in wonder. For undoubtedly the cock embodies some favourable features of the French character and the French demeanour, but (as a keener spirit of discrimination would suggest) viewed under an angle of mockery and exaggeration. The bluster, the arrogance, the tendency to gasconade, are all there; there also is the indomitable courage, for amongst all breathing creatures there is hardly one (unless the bull-dog) more victorious over passion than the game-cock. But still, men generally would not relish a mirror help up even to their noblest qualities if this were done under a concurrent attempt to throw cross lights of ridicule upon the total ensemble of their character." The objection against the cock, which undoubtedly is rendered with great spirit on the coins, may in reality arise from the misgiving that it is too true a representative of the French people.

THE late RICHARD CADBURY, who died suddenly in Jerusalem, deserves remembrance for his belief in the effect of buildings in aiding social progress. One of his works was the Friends' Hall and Institute in Moseley Road, Birmingham, on which he expended about 30,000*l*. At Bournville he erected and endowed a group of thirty almshouses which cost him at least 40,000*l*. His former residence, Moseley Hall, he had converted into a convalescent home for children, and this gift is worth 30,000*l*. From time to time he presented large sums to the building funds of various institutions. The regret in Birmingham for his loss is therefore well founded. One of the members of the Corporation, in referring to the event, said that "Mr. CADBURY seemed to regard himself rather as the trustee than as the possessor of his own wealth, and in every instance in which he gave he was very careful that his gift should not be misbestowed, but should be productive of the greatest good possible. When he was so convinced there seemed little limit to his generosity. Birmingham would miss in him a friend whom it would be impossible to replace, and there were many in their back streets and in the courts who would feel that now they had lost a true benefactor." Unlike many philanthropists, Mr. CADBURY has left memorials of his generosity which will long endure.

ACCORDING to the *Times* correspondent in Vienna, Mr. G. F. BODLEY, A.R.A., has represented England on the jury which has just awarded eight prizes for designs for the memorial church to be erected in Vienna in commemoration of the jubilee of the Emperor FRANCIS JOSEPH. This jury, which also includes prominent representatives of the profession in Germany, France and Italy, has postponed the selection of the architect to be entrusted with the work. The competition was confined to Austrian subjects. The 48 designs sent in were in the Gothic, Lombardic and Renaissance styles, and were carefully prepared. A strong desire is felt that this church, which is to comprise a chapel dedicated to the memory of the late Empress ELIZABETH, should be a dignified and monumental structure, worthy of the occasion and of the present advanced condition of ecclesiastical architecture. This is the first time, we believe, an English architect has officiated as a judge in a continental competition, although occasionally Englishmen have taken part in them. The case of the Californian University does not count, for it is an American project, and it was anticipated there would be English competitors. Nor can the competition for the Constantinople church be considered, for the building was to be constructed by the aid of English money. That in a contest between Austrian subjects Mr. BODLEY was selected suggests that his Gothic buildings are worthily appreciated abroad.

AMONG the economical beliefs of the present time is one which assumes that a social difficulty would be overcome if the humbler classes possessed their own houses. It is not merely that they would have a guaranteed shelter, but it is concluded that an income could be derived from the property. It is supposed that the problem of finding provision for old age could be easily solved in that way. The new theory is recognised by Sir SAMUEL MONTAGU, who has offered to the London County Council 25 acres of land at Edmonton to serve as sites for working-class dwellings. He has laid down the following conditions of the gift:—"(1) That the land shall be used for the erection of dwellings for the working classes at such rents as will about cover the interest and sinking fund of the outlay; (3) the occupier to have facilities for the acquisition of a long lease at a low rent. If the leasehold is acquired, it must be conditional on occupation, when that ceases the leasehold to be sold to the London County Council at a valuation; (3) residents in Whitechapel of over three years' duration to have the preference as tenants whenever a vacancy occurs (say for a month) without distinction of race or creed." It is not apparent that the Council could accept land on such terms, for there is a limitation to their powers in selling and leasing land or houses. The housing of the working classes committee have given attention to the scheme, and they have adopted the following recommendations: "That the Council do accept the offer of Sir SAMUEL MONTAGU, Bart., M.P., of land at Edmonton for the erection of dwellings for the working classes, subject to the following conditions:—(1) That residents in Whitechapel of over three years' duration shall have the preference as tenants of the dwellings to be erected on the land when vacancy occurs (say for a month) without distinction of race or creed; (2) that Sir SAMUEL will procure sufficient land for the construction of an approach road to the north-east corner of the land; (3) that Sir SAMUEL will undertake to satisfy all the requirements of the local authority as regards Salmon's Brook."

THERE are so many guide-books for English tourists it is difficult to obtain a footing for a new series. "The Story of Rouen," by T. A. COOK, illustrated by H. M. JAMES and J. E. COOK, if considered as the first of an experiment in publishing, has a passport to success from resemblance to Messrs. DENT'S publications in combining beauty, clearness and accuracy. As an example of typography it is worth notice, for the delicacy of the illustrations matches the type, and every page is pleasant to look on. But appearance is not the only quality. The author appears to be familiar with Rouen, and he describes it like an enthusiast who is possessed of knowledge he has tested. Every year crowds of English tourists visit Rouen, and they would find their pleasure enhanced by carefully reading "The Story" beforehand, and following the order in which the buildings are described, with the little volume as a guide. Such elegance and portability are rarely found together.

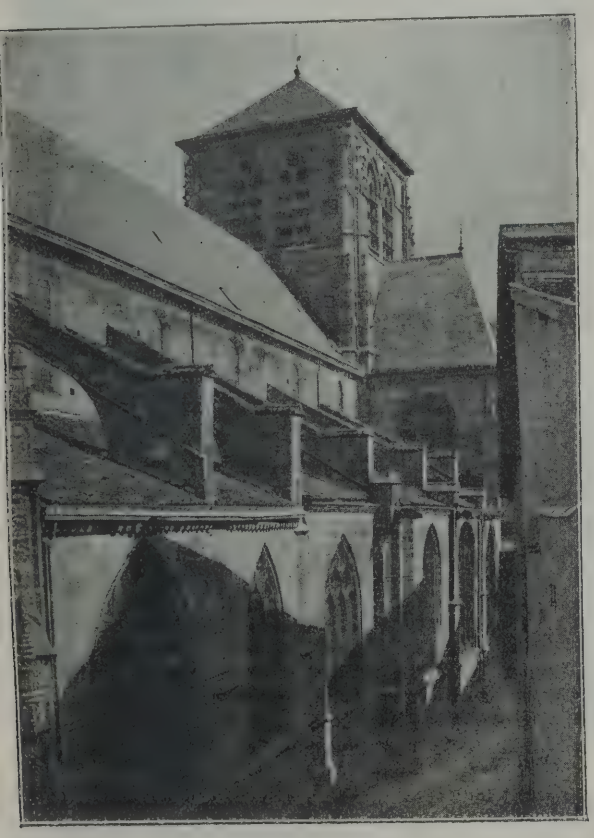
SUMMER HOLIDAYS AMONG FRENCH CATHEDRALS.



BY THE AUTHOR OF "ECCLESIOLOGIA GERMANICA," &c.

(*Continued from page* 195.)

Troyes. Châlons-sur-Marne.

XV.

RETURNING to the Cathedral on Monday morning, after another protracted ramble about the city, I find the ons in the choir reciting their matutinal offices in notone. Mass is said by one of them in lace alb and n crimson chasuble. Sext follows. During its progress the ristan is busied with preparations for a funeral. A black ntal is placed upon the high altar, and a cope of the same our is hung in readiness on a stand near the sacristy door. the conclusion of Sext, I request one of the cantors to show the music of the office hymn sung yesterday. With much iteness he repairs to the vestry, situated in the south aisle of nave, and returns with a paroissien. Hurriedly pointing the place, he is obliged to take his station in the little ocession, which I see is just emerging from the south choir le. It consists of the crucifer and taper-bearers, the cantors d the officiating priest. They all leave the cathedral by the eat portal of the north transept, and wend their way along e streets to the house of the deceased. I follow them. Very turesque is this little procession, with the sun flashing

CHÂLONS: ST. ALPIN.

on the silver crucifix and the white surplices. Returning with he mourners and friends, all on foot, some rather dreary chanting begins, and is continued till the west door of the cathedral is reached. While the coffin is removed from the hearse the officiant walks up the nave, and, assuming the black cope, meets the cortège at the entrance to the choir. The preliminary office over, the priest retires, returning shortly in a black and silver chasuble, and accompanied by deacon and subdeacon. The Mass begins; no organ is used, but a violoncello gives richness to the plain chant, of which I am unable to distinguish much beyond the *Dies Iræ*. It is not a little diverting to watch the friends, the male members of whom—accommodated with stalls in the choir, and like the young MacStingers "knowing little about the ceremony, and caring less"—slip out to a neighbouring café, "*pour passer le temps*."

By midday I have taken my last walk round the cathedral, and have closed the west door behind me with a regretful sigh. Shortly after I am *en route* for Châlons. It is very hot. There is André, about to start on a tour to Switzerland. Papa and M. le Curé have come to see him off. "Bon voyage" is said. The engine shrieks, and the train is making its circuit of the city, which lies in a vast plain, to join the main line. Although very beautiful, the flat champagne country gets wearisome after a bit. Luckily I am provided with literature—Hare's entertaining volume on N.E. France; Murray's capital handbooks; and a volume of Albert Smith, who always reads well abroad.

There is a grand turn-out at Châlons, where several omnibuses from the various hotels are drawn up in the station yard. I mount the box of that belonging to the Hôtel de la Haute Mère de Dieu, and the vehicle, after dawdling about the yard in the vain hope of catching a priest or two—numbers of whom are arriving for the prize-giving at some Lycée or another—and for the edification of the solitary inside passenger who has been informed that it is going directly, starts for the town. We rattle gaily over the bridge, and past the cathedral of St. Etienne, which is far finer than books or common report have led me to expect; just catch a glimpse of the spires of Notre-Dame; turn sharp round the corner by the church of St. Alpinus, where a curtain waving in the western door has quite an Italian air; and so draw up at the excellent hostel above named, where Monsieur and Madame, as in all well-regulated inns, are waiting to receive me, just as though I had written to announce my coming a week beforehand. Presently

CHÂLONS: INTERIOR OF NOTRE-DAME.

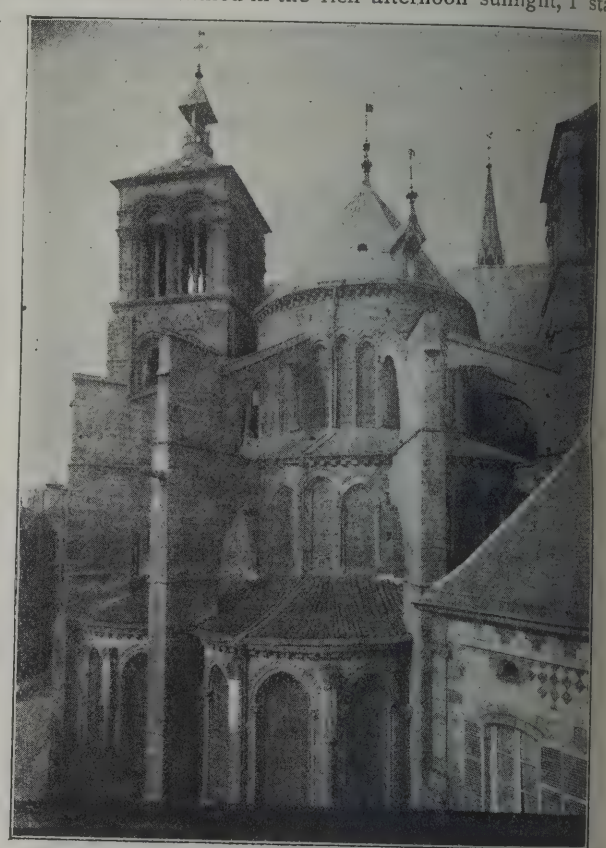
I am shown to a nice airy bedroom, with acacias waving in the garden below in the afternoon sunlight, and commanding a view of the cathedral. Then comes some refreshing tea in the courtyard,* and a pleasant stroll about the streets.

I devote the whole of Tuesday, August 9, to Châlons and its neighbourhood. Although inferior ecclesiologically to the church of Notre-Dame, the cathedral of St. Etienne,† by its simple

* There is something extremely enjoyable in taking refreshment in the courtyard of a French hotel with the feeling before you that there are so many interesting things to be seen. One of the pleasantest I know is that of the Hôtel de l'Ecu at Sens. It was dark when I arrived in that little archiepiscopal city, and had no idea where the cathedral was. On throwing open my bedroom windows a huge mass, from which a grand, calm, white figure stood out, confronted me. It was the front of the cathedral, and the figure that of the Majesty, adored by angels, in the western gable. This great grey front, rising above the tiled roofs of the hotel, presents a most enchanting picture.

† The large number of French cathedrals and churches bearing the name of the pro-martyr is very remarkable. Among the cathedrals

solemn grandeur, impresses me as much as any of the glories of France I have seen this year. Standing with the whole of its northern side thrown open to the main street,* with a prettily laid-out flower-garden in front, the noble array of Geometrical Decorated windows in aisle and clerestory is seen to great advantage. No doubt the exterior suffers much from want of a proper western façade, the present being an abrupt Italian one of the seventeenth century, erected after a fire which did much damage, necessitating repairs and additions in the taste of their age. The oldest portions of Châlons Cathedral are the towers, which, Teutonic fashion, stand to the east of the transepts. There is much in the disposition of the plan of this cathedral that brings Westminster to mind—the grandly exposed north side of which I have already spoken; the entering by the north transept door, and finding the poorly-stalled *chorus cantorum* arranged in the eastern part of the nave, and on the left the short apsidal choir with its encircling chapels. After five-aisled Troyes the nave of Châlons Cathedral looks narrow, but this impression wears off after a visit or two, and the eye soon dwells contentedly on the grand, unbroken and lofty arcade of German-looking round columns, with their foliaged capitals, and upon the superb series of windows in the aisles, which do not open here into chapels of a later age—quite a relief this.



NORTH-WEST VIEW OF NOTRE-DAME AT CHÂLONS.

From the cathedral I go to Notre-Dame, without doubt the noblest specimen of Early Pointed France can show, wonderfully little damaged by time, showing few or no additions in subsequent styles, and singularly fortunate in having been restored under the care of a true ecclesiologist—M. le Curé Champenois—about forty years ago. Like the cathedral, the choir—the shortest in France, I believe—is flanked just east of the transepts by steeples, and there is another pair surmounted by leaden spires at the west end. In their incomplete state these eastern towers have a grand and massive effect, taken in conjunction with the boldly sweeping apse and the circumambient chapels.* Excellent taste characterises all the instrumenta in the interior of this noble church, and the modern stained-glass by Lusson deserves the highest praise.

The other Châlons churches have their especial points of interest. St. Alpinus, with its long Early Pointed nave and low central tower pyramidically capped, looks well over the tops of the houses in the large Place. St. Loup, Middle Pointed, has a long Teutonic-looking choir with lofty windows, all glowing with rich modern glass. St. Jean, with its narrow Romanesque nave, its transepts with an eastern aisle to each, affording lovely perspective views, and its long, square-ended English-like chancel in Early Pointed, approached by flights of steps, leaves a most profound impression upon me.

I get all my church-hunting over by midday, and rest, as I have a pilgrimage to make in the evening to the celebrated Sainte Marie de l'Epine,† situated about five miles to the east of Châlons. From a café in front of Notre-Dame, whose western front is bathed in the rich afternoon sunlight, I start

CHÂLONS: EAST END OF NOTRE-DAME.

for Epine, and, being in good form, enjoy the walk, which lies along a high road with a vast expanse of flat country on either side, amazingly. It is about seven o'clock when I reach Epine, and while making the circuit of the exterior of St. Marie's the bell begins to toll. Knowing from experience that this is the signal for closing the church, I hurry round to the west entrance, just inside of which I find a Sister of Mercy and the custodienne engaged in this calisthenic exercise. And here I meet with a little bit of true French politeness. Seeing that I have walked some distance, and am anxious to see the church, instead of following me all round and jangling keys, as the Mrs. Miff or the Mr. Sownds of an English church would probably do, the Sister and the custodienne, an elderly female, betake themselves to a seat at the west end and engage in

having this dedication may be named those of Agen, Auxerre, Bourges, Cahors, Châlons, Limoges, Meaux, Metz, Sens and Toulouse; whilst in almost every town is a St. Stephen's Church. It is curious that this dedication should so rarely be found among our old churches.

* That hallowed *religio loci* which seems to pervade the immediate neighbourhood of our English cathedrals is almost entirely wanting abroad. In nearly every city the cathedral rises in the midst of the town, from the main street or large stony square, and often encroached upon by secular buildings, as at Rheims and Rouen, Sens and Troyes. To be sure there is a certain calmness about the locales of Auxerre and Bayeaux, Beauvais and Chartres; but the smooth lawns, umbrageous trees, grave old prebendal houses, cloisters and other entourages which unite in giving such an air of calm seclusion to the closes of Winchester and Canterbury, Lichfield and Salisbury, Lincoln, Wells, and Peterborough, are entirely wanting. The well-kept country churchyard is rarely, I may say never, met with in France.

* The façade of the south transept, with the tower rising just to the east, strongly recalls the south-east one at our own glorious Canterbury.

† Commenced towards the middle of the fourteenth century this is one of the most graceful churches on a moderate scale that France can show in a mingling of the Geometrical and Flowing Decorated periods. One of our most accomplished lady writers of travel has compared the light open spires to handfuls of wheat bound together.

rivate devotion. After I have sat for about twenty minutes in ont of the elegant stone rood-screen, admiring this lovely rench Decorated church which, built of white stone streaked ere and there with brown, looks as if formed out of alabaster, e elderly female advances quietly up the south aisle, kneels r a few minutes before the quaint image of the Blessed Virgin nd Child, enshrined amid flowers and tapers, and presently hispers, "Sir, it is time to close the church." I, of course, se to go, and during the purchase of a few souvenirs, ologise to the good Sister for detaining her in the church so ng beyond the ordinary hour of closing. With the customary urtesies we part, I to walk back to Châlons, towards which I n but half-way when some ominous-looking black clouds put an appearance. But no rain comes. "I wish it would," marks a carter who gives me a pleasant "Good-night" as he gs on his way to the hamlet I have just quitted. Still I am t sorry when I regain Châlons, with its paved streets, gas-mps and policemen. Smoking a meditative after-supper garette on the bench outside the hotel door, the strains of Veber's "Invitation to the Waltz" float across the square om an upper room, where some sons of harmony meet once a eek to practise, and thus closes a very enjoyable day.

Two years afterwards, being *en route* from Rheims to angres and Dijon, I took the opportunity of a wait at Châlons

Interior of the Church at Epine.

o renew my acquaintance with its architectural glories. I evisited the cathedral with pleasurable feelings, spending a onsiderable time in its solemn nave, so Anglican from absence f side chapels, so Teutonic with its tall round columns, so leasing altogether from its simplicity. Over a confessional in ie northern choir aisle I read, "Deutscher und französischer eicht-Vater," while a printed notice near the north transept ntrance set forth the information that an "Instruction" in erman would be given on Saturdays in St. Joseph's Chapel, ear the college. Significant, this.

From the cathedral I strolled on to Notre-Dame, where I und a priest catechising a score or so of small children seated n chairs at the west end of the nave. One of their number, a ttle boy expelled from the class, doubtless for bad behaviour, as kneeling all by himself on the stones in the central passage. he instant I set foot in the church forty small eyes were rned inquiringly upon me, following me whithersoever I ent. But the excitement reached its acme when, in the ourse of inspection, I passed round to where all the little eople were gathered about their pastor. "Enfants! attention, s'il vous plaît," cried the priest, slapping his book on the chair-ledge in front of him, "et ne regardez pas ce monsieur-là!" But without much effect, for I still continued to be "the observed of all observers" until I deemed it prudent to conceal myself in the dusky recesses of one of the circumambient apsidal chapels. A year later I entered a German Protestant church at Dortmund under much the same circumstances, meeting, however, with a totally different reception; being, in fact, motioned to the door by the irate "pastor," or whatever he called himself.

Few French churches have passed under a more quiet and conservative restoration than this noble Transitional one of Notre-Dame at Châlons-sur-Marne, and this is owing to the jealous care of the aforementioned curé, M. Champenois, whose acquaintance Mr. Street made while on a tour in this part of France about the year 1857. "Here," writes Mr. Street, "I made the acquaintance of M. Champenois, a charming little enthusiast who is busy restoring the whole church. He has cleaned and restored the interior completely, showing all the stone in the groining, and it looks so well. I told him my name, and he was quite up to all about the Lille competition, the more by token that Clutton and Burges's design was to a great extent (as I saw directly and as he told me) a copy of his church."

This refers to the competition, open to the architects of

West Front of Church at Epine.

Europe, for the erection of the church of Notre-Dame de la Treille at Lille. The design furnished by Messrs. Clutton and Burges was placed first; that of Mr. Street second—a fact quite sufficient to prove the infinite superiority of our architects (travelled and cultured men) over those of the Continent at that period (1855-57). It is almost needless to say that this competition resulted in nothing but waste of time and the ultimate selection of a French architect. Mr. Street's design, which lies before me as I write—a most masterly conception—bore the motto, "Quam dilecta tabernacula Tua, Domine virtutum." It was an unmistakable French church, and rigidly observant of the strictest interpretation of the conditions of the competition. As in all such cases, the designs ranged from the sublime, through the mediocre, the insipid and the wildly extravagant to the ridiculous. One or two looked more like the vagaries of insane pastrycooks, and as such only tended to bring ridicule and disgrace upon the name of Pointed architecture.

Notre-Dame at Châlons-sur-Marne belongs to that grand group of churches which shed a lustre upon the last half of the

twelfth century, truly an Augustan age in the annals of French ecclesiology—an age which produced Mantes and Laon, Chartres and Soissons, Saint Leu and Noyon, and at home the choir of our own glorious Canterbury and the Round of the Temple Church—an age in which the Romanesque had just passed into the grace of the Early Pointed.

Its quadruple division into arcades, lofty triforium of two pointed arches springing from a slender shaft with an unpierced tympanum, a smaller triforium of lancet arcades, and a clerestory of tripled lancets of equal height, imparts a far grander appearance to the interior of Notre-Dame at Châlons than is at first suggested by its somewhat heavy and German external appearance. Of far greater interest than the cathedral, which has suffered much from incendiary causes and injudicious repairs consequent upon them, Notre-Dame may be taken as a typal French church of the earliest Pointed period, and in many features bears a great resemblance to St. Remi at Rheims. In plan and design the apses of the two churches are similar, and though that of Notre-Dame is on a smaller scale, the triple tier of windows, large single-light ones in the chapels and equal heighted tripled lancets in triforium stage and clerestory, the large plain semicircular flying buttresses, the neatly-planned choir and circumambient aisle roofs, are all points of resemblance to St. Remi much too obvious to be overlooked. Its undisturbed plan and the presence of but few late additions or insertions are all elements conducing to place Notre-Dame at Châlons very high among French churches of the second class. Perhaps its most singular external features are its western steeples flanking a typal Early French Gothic front with three broad lancets and a rose above, like Chartres. Of the spires which surmount the towers, that on the south is a remarkably elegant and curious specimen of lead-work, very lofty, having four tall pinnacles growing out of it at its base and a cluster of eight spire lights—one to each face—about midway up. Very precious is this south-west leaden spire of Notre-Dame at Châlons as affording evidence of the extraordinary extent to which decoration was carried in the Middle Ages. The northern spire is a copy, and it has been proposed to raise similar ones on the pair of Romanesque towers flanking the one-bayed eastern limb, but from the shortness of the church they would have too much the effect of reducing all to the dimensions of mere turrets, a result by no means desirable, at any rate if one may judge from a drawing of the church, as "proposed to be restored," which appeared about the year 1851.

A large Flamboyant porch protects the noble but sadly mutilated south portal—a very elaborate specimen of Romanesque work, from which there is a descent of several steps into the church, necessitated by its being built upon ground sloping gradually from south to north. During his visit to Notre-Dame at Châlons, Mr. Street, in the course of conversation with its devoted curé, touched upon the choral arrangements. "Concerning which," wrote the future architect of St. John's, Torquay, St. Mary Magdalene, Paddington, and St. John the Divine, Kennington, "he is heterodox. How curious to find a French priest, actively engaged in church restoration, arguing in favour of singing in a western gallery, and of admitting the 'faithful' into the choir, and I, an Anglo-Catholic, protesting against both. Yet so it was. However, we parted excellent friends."

Probably no architect of his day, Anglican or Roman Catholic, English or Continental, knew so thoroughly and exactly as Mr. Street did what were the requirements of a modern cathedral, and this makes us regret all the more that he was not elected to carry out the cathedral at Edinburgh.* The present structure, although doubtless ecclesiologically correct and most sumptuously fitted, is, like most of Scott's churches, cold and unsympathetic. Mr. Street's designs, on the other hand, were stamped with a genuine cachet which it was impossible to mistake. Without descending in the least degree to bizarrerie, his plans for St. Mary's, Edinburgh, are distinguished by slight and temperate departures from ordinary types of form and decoration, and thus, without any startling oddities of design, the cathedral would have had a novel grace imparted to it consistent in some measure with its romantic locale.

But I am wandering far away from Châlons and lovely tawny-coloured Notre-Dame. Its south transeptal elevation, rather suggesting the eastern one of Canterbury, combines with the spireless towers flanking the eastern limb and the triple fenestration of its apse, a most enchanting architectural group from the street upon which it abuts.

In the north aisle windows—Flamboyant insertions—is much valuable Cinque Cento painted glass. The apse chapels opening from the aisle by tripled arches on slender pillars as at St. Remi are very Mediævally appointed, and their windows, as well as those which peer so bewitchingly through the trifolial arcade, and those of the clerestory, are good specimens of modern French vitreous decoration, and thoroughly in keeping with the surroundings. As in the cathedral, the oldest parts of Notre-Dame are the eastern walls of the transept against which the Romanesque towers abut.

Placed against the south wall of the transept is the only piece of rococo furniture in the church—the old high altar, apparently forming a species of cheffonier for a miscellaneous collection of articles, but retained here doubtless from considerations of sentiment, for, as I may remind my readers, in 1793, while the nave of the church was dedicated to the Goddess of Reason, Mass was said in the choir with only a few days' interruption.

(*To be continued.*)

* It is interesting to note that Mr. Burges's design for Edinburgh Cathedral was a modification of his prize one for Lille.

PRE-HISTORIC EGYPT.

THE discoveries made during the last five years in the Nile Valley have completely changed our views as to Egyptian history and civilisation. Until quite recently, says the *Glasgow Herald*, the horizon of monumental Egypt was marked by the pyramid of Senefru at Medum, where we found civilisation, art, and sociology fully developed, indicating by this perfection centuries of growth and development, of which, however, no trace existed. That vast area of the pre-dynastic and pre-historic age of Egypt seemed to be lost—to have passed away without leaving the smallest record of those who for successive ages had toiled in laying the foundations of Egyptian civilisation. Now, however, that the work of exploration is being carried on, not only with energy, but also in a strictly archæological and scientific manner, even the beginnings of this civilisation can no longer remain hidden. Tradition, the last flashes of the lamp of history, had always pointed to Koptos as one of the earliest settlements of the Nile Valley, and the explorations of Professor Flinders Petrie on the site of this city have proved that this supposition was correct. The pre-historic statue of the local god Min, wrought before the use of the chisel was known (which is now in the Ashmolean Museum at Oxford), as well as the first efforts in art found in the red-clay figures of animals, made it plain that here we had to deal with an age long prior to that of Senefru and the Pharaohnic dynasties. Koptos was not, however, the only pre-historic settlement in Middle Egypt, the region in which it is now evident that Egyptian civilisation first grew. At Ballas and Nagada, on the edge of the Libyan Desert opposite Koptos, as well as at Abydos, remains of the so-called New Race (now known to be the pre-dynastic Egyptians) were found; and more recently at Hierakoupolis, M. Quibell has made a still more important discovery. At the same time M. de Morgan, the director of the Museum at Gizeh, has uncovered the great royal tomb, with its buried treasures, which has been identified by M. Maspero and most Egyptologists as the burial-place of Menes, the first of the Pharaohs.

It would seem that when once the pre-historic age had begun to yield up its secrets it did so in no stingy fashion, for the work of M. Amélineau at Abydos resulted in the recovery of several more royal tombs of the earliest dynasties, or, lastly, in the recovery of the mythic tomb of Osiris, the most holy spot in all Egypt. The publication of the works of MM. de Morgan and Amélineau and the exhibitions of the finds of M. Quibell have certainly, as has been remarked, produced a complete revolution in our knowledge of the beginnings of civilisation in the Nile Valley. In Egypt the epoch of pre-historic time does not permit of strong distinctions, as in other primitive countries. There is no clear separation between the Neolithic and the pre-historic Bronze period, and the use of stone extends far into the historic, as shown by the representations of making flint knives in the twelfth-dynasty tombs at Beni-hassan, and therefore of a date as late as B.C. 2500. The discovery of the great royal tomb at Nagada, however, marks now the threshold of Egyptian history, long prior to the former starting-point of

e age of Senefru; but here again we have numerous and rcible indications of a vast antiquity behind even this remote ɔoch, which cannot in reason be placed lower than 4000 B.C. he tomb of Menes shows no trace of primitive culture and the eginnings of a civilised community only emerging from the rk ages of savagery. It is the work of a people long used to iilding construction and to the employment of the fine arts, ɔt by any means isolated from the outer world. The dis- ɔvery from an archæological point of view cannot be too ghly estimated. The building—for it is not an excavated mb, but a royal dwelling-place of the dead—is a parallelo- ram measuring 54 metres by 27, or 100 cubits by 50, a pro- ɔrtion of importance. It is built of crude brick, and the outer alls have buttresses placed at regular intervals. The orienta- ɔn of the building is remarkable, the angles being turned to the ardinal points. To the student of Egyptian archæology e structure seems at once of a non-Egyptian character, id immediately calls to mind the brick architecture of ancient haldea, as seen in the temples and palaces of Judea (B.C. 3oo), at Tello and at Nippur. This idea is still more enforced hen we consider the proportions of the building, which are e ratios almost invariably employed in Chaldea; and lastly, id of great importance, the orientation, which is that of the haldean builders, and not that of the architects of the Nile alley, as shown by the earliest pyramids. The interior rrangements are most curious; the building may be divided to two portions, the tomb and the other chambers. Imme- iately adjoining the outer wall are a series of sixteen chambers f nearly equal size, forming a corridor round the inner portion. These were found to be store chambers, filled with all kinds of rovisions, furniture, &c, for the deceased. The inner por- on, or tomb proper, consisted of five chambers, arranged gain in corridor form, with doors communicating from the ntrance at the north-west end. The central chamber of these as the largest, and evidently the burial chamber, but no ɔrtion showed any signs of painting or decoration of even the mplest kind. The most astonishing result of the explorations as the revelation of the fact that the whole of the edifice and s contents had been at some remote period subjected to a reat conflagration, which had reduced everything to ashes or harred remains.

It was at first thought that this burning had been part of ne burial ceremony, but this seems doubtful. It certainly ook place at a remote period prior to the Middle Empire, as urials on the upper strata of the mound show no trace of fire. t is, moreover, evident that long before the time of the Rame- ides the building had been quite covered and hidden, as no race of any later occupants were found. Indeed, it would eem probable that the tomb was early closed for ever. It esembles those discovered by M. Amélineau at Abydos, but is f earlier date; and as in these latter were found the clay seal- ngs of jars of Semti and Mer-bau, the fifth and sixth kings of ne first dynasty, the discovery of the name of Mena or Menes n an ivory plaque is not out of reason. The provisions for he deceased in these early tombs were enclosed in jars of reat size; their tops were covered with clay caps and im- ressed with seals, with computations of the amount or number f the objects they contain. Most of the vases, as well as he miniature ivory and ebony furniture placed in the omb for the use of the dead, were broken; but this was no loubt done so that the *kas*, or spirits of the objects, might not uit the service of the dead. The objects discovered are most ariable. Ivory and ebony show distinctly a trade with the Upper Nile, and especially important are some fragments of rhinoceros horn, an article of rare occurrence. The stone vases are very interesting, there being specimens of porphyry, quartz, geoborite (carbonite of magnesia—an extremely rare material), diorite, dolomite and the well-known Egyptian alabaster. The vases are artistic in form, and are moulded by the use of polish- ing stones, and hard stone cores to hollow the interior. The vases resemble those of the New Race found at other sites, and show considerable artistic merit. It is noticeable that all the pottery is hand-made, the wheel being unknown. One of the most important finds here consisted of several objects of obsidian, a valuable commodity in the Neolithic age, not, how- ever, found in Egypt, and almost entirely a product of Western Asiatic origin. It was known at the earliest ages in Mesopotamia, and is found in the ruins of the cities of South Chaldea and in the Neolithic settlements on the Persian frontier. The presence of obsidian in the Nile Valley at this remote epoch is a strong proof in favour of the existence of a close trade intercourse between Syria, Egypt, and Chaldea at this distant period. We have already seen how the architectural features of the tomb, as well as the carved ivories, favour this theory of intercourse. Among the objects discovered were portions of several ivory boxes or caskets containing spice or aromatic gum. These vessels were supported by bulls' feet, the workmanship of which is extremely un-Egyptian, resembling in a wonderful degree the feet of the winged bulls so common in Babylonian and Assyrian art. The same remark applies to the carved figures of dogs and lions. To anyone who has a knowledge of Chaldean art of the earliest period, as illustrated by the state of the Vultures now in the Louvre, the Chaldean appearance of the sculptures in such fine pieces of work as the state tablet of victory of Nar-mer or the mace heads of the same king admits of no other explanation than an intercourse of considerable close- ness between those two ancient civilisations, and perhaps after- researches may show the point of union to which they are tending, and after all the beginnings of civilisation in the Old World may be obtained.

RESTORATION OF THE ROYAL STEWART VAULT AT HOLYROOD.

VISITORS to the Chapel Royal at Holyrood, says the *Scotsman*, will no doubt note with interest a work of renovation which has recently been carried out by command of the Queen upon the royal vault at the south-east corner of the roofless interior. Upon the entrance to the vault, which had hitherto been quite open to the air, and protected only by a wide iron grating, a door of light oak has been placed, bear- ing a brass plate and an inscription to the effect that "This vault of the Scottish kings contains the remains of David II.; of James II. and his Queen, Mary of Gueldres; of Arthur, third son of James IV.; of James V., his Queen Magdalen, and second son, Arthur, Duke of Albany; and of Henry Lord Darnley, consort of Mary Queen of Scots." The inscription goes on to say that "their resting-place was desecrated in the year 1688," and that recently "these mortal remains of her Stewart ancestors were reverently collected and en- tombed by command of Queen Victoria."

The remains to the re-entombment of which Her Majesty has thus paid such considerate attention have had an interesting history, and one not particularly creditable to the country. When the royal vault was constructed at Holyrood in the first half of the sixteenth century all the remains that could be collected were carried thither, an operation which was easy enough, inasmuch as they were embalmed and enclosed in lead. So they rested in safety until the troublous times of 1688, when the Revolution mob "wrenched open the leaden coffins and scattered the bones of James V. and Magdalen of France, with those of other royal personages, over the paved aisles of the abbey church." For a century or so the remains were exposed in the open to the elements and to the public gaze. Robert Chambers records that in the beginning of the present century a beldame cicerone would describe the bones in this style, "King Jamie's shouther, and nearly the hale o' the Countess o' Roxburgh, and baith Lord Darnley's thie banes, wi' a gude bit o' the Yerl o' Buchan's back." Shame at length compelled the authorities to collect the remains and place them in the vault on stone shelves laid in the wall of the old Norman doorway. There they lay, bleached white, up till a few months ago, when by Her Majesty's command they were carefully collected and reinstated in the restored tomb. The only coffin in the collection is that which is supposed to contain the remains of Mary of Gueldres, which was unearthed in 1848 in the removal of Trinity College Church to make way for the North British Railway.

GLASGOW ARCHITECTURAL ASSOCIATION.

AT the usual fortnightly meeting on Tuesday evening, March 21, in the rooms, 187 Pitt Street, Mr. Alex. McGibbon, M.A., in the chair, the chairman referred to the recent resolution sent to the Aberdeen Town Council regarding Greyfriars Church, mistakenly called St. Nicholas in the letter, and for which he took all blame. It was, of course, a confusion of names only; there had been no confusion of the buildings.

Mr. Sam Mavor then delivered a lecture on the "Electric Lighting of Interiors." The lecturer pointed out that it does not require a skilled craftsman to lay electric-light conductors in the grooves of wood casings erected by a joiner, nor to screw to their bases manufactured switches and such apparatus. The result is that much wiring work is done by men and lads who are not tradesmen and who are ignorant of the consequences which might arise from their inexperience or carelessness. Many defects are of a kind which cannot be discovered by ordinary tests after the completion of the work, and it is there- fore of great importance that wiring work should be inspected during progress. Architects were strongly urged to encourage their clerks of works to qualify as inspectors of electric-light wiring, as they only were in a position to give inspection of the nature required. The best arrangement of electric lamps in residences and other buildings was described, and the relative reflecting powers of walls of various colours, and the ratio of candle-power to superficial area and cubic contents to be lighted were given. It was pointed out that much money was wasted in the lighting of shop windows by unsuitable arrange- ments of lamps. Arc-lamps were often fitted too low, and

passers were dazzled by the glare, so that they could not see the goods exhibited. The barbarous practice of interposing unshaded electric lamps between the goods and the observer is much too frequent in shop windows. Lamps so placed make it impossible for an observer, without a painful effort, to see the objects beyond him. The vendor thus renders an inspection of his wares a disagreeable operation instead of an inviting diversion.

At the close Mr. Mavor was awarded a hearty vote of thanks for his valuable and instructive paper.

CONTINENTAL KURSAALS.

THE Corporation of Harrogate are about to erect a Kursaal, and for that purpose it was arranged to send a deputation to visit continental spas with a view to obtaining information and suggestions. The following descriptions are taken from the report :—

Ostend.

At the end of the Esplanade arises a magnificent building known as the "Kursaal." There are little or no grounds attached to it. The back part of the Kursaal is occupied by the following rooms :—A large ball-room, dining-room, café, billiard-room, gambling saloon with five gaming tables, reading-room, writing-room, flower shop, cloak-rooms, telephone exchange, &c. The front part consists of an oval-shaped concert-hall, capable of holding 6,000 people. The roof of this hall is arched and supported by several columns. A gallery 6 feet wide runs round it about 16 feet from the floor, with another smaller gallery close to the roof. The floor is tesselated. At the back of the hall there is an alcove with a curved roof. In this alcove is a gallery which projects slightly into the body of the hall and drops somewhat lower than the large gallery above referred to, and in this gallery the orchestra play, the effect of the curved roof being to send the music out into the body of the hall. At the back of this gallery is an organ. The hall is lighted by thirteen arc lamps, and we observed that there were one or two additional lamps which could be lighted when necessary. There is also a row of glow lamps round the arch, which is over the orchestra. Considerably more than half of the concert-hall is built on iron pillars, filled in with windows which in warm weather are hydraulically lowered into the ground, thus throwing the concert-hall almost entirely open. The concert-hall itself is surrounded by a covered promenade, which is closed in in winter by boards, and used partly as a winter garden and partly as a promenade, the concert-hall proper or the central portion being closed. Beyond the covered promenade is an open terrace overlooking the Digue. The furniture of the hall is of the simplest description, the tables being small round wooden ones, and the chairs being also wooden, with cane bottoms.

Spa.

The grounds attached to the Kursaal are about twice the size of the Harrogate spa. They are well timbered with full-grown forest trees. Between the trees are wide avenues, which form extensive promenades. In the centre of the principal promenade the ground opens out, forming a large circle. At one side of this circle there is a large café, in front of which the people sit in fine weather and listen to the band which plays in the centre. There is little attempt at gardening, most of the ground beneath the trees being covered with gravel, but here and there ornamental flower beds add light and variety to the scene. Everywhere beneath the trees were innumerable chairs and tables. In lieu of a Kursaal there is a fine covered promenade, composed of glass and iron with the exception of the roof, which is of slate and timber. The building is about twice the length of the winter garden at the Royal Baths, but not so elaborate, although it has the reputation of being the finest covered promenade in Europe. There are numerous curtains which give the place a more comfortable look than it otherwise would have, and we noticed that here instead of the wooden chairs and tables which they had at Ostend, they had a combination of iron and wood chairs and tables.

There is also in the town itself a rather extensive winter garden, adjoining the famous Pouhon Well or pump-room, which can be used for dancing, or in wet weather for a promenade for the water drinkers. We particularly noticed a pretty arrangement of palms, the plants being in large tubs raised on peculiar shaped pedestals of wood.

Aix-la-Chapelle.

The Kursaal here is a massive building, very like an ordinary concert-hall, and would not be at all suitable for Harrogate. Attached to the concert-hall is a very good ball-room and reading-room. There is a small garden attached to it, and the usual tables and chairs are placed under the trees for visitors to sit and listen to the band, smoke and drink coffee, beer, &c. The concert-hall itself would hold about 800 people, and smoking is allowed at ordinary concerts.

Ems.

This is a pretty little town with a river running through the centre and well wooded hills all round. The Kursaal is connected with the baths and has some lovely grounds overlooking the river. In the grounds is a covered promenade open at the sides, the roof being supported by iron pillars. The grounds are bounded by iron railings and not very extensive, and the band can be heard as well from the outside as from the inside.

The concert-room itself is square, with large plate glass windows. The furniture is of a very expensive nature, the chairs being mahogany and red plush, or mahogany and cane, the latter being exceptionally light and pretty. There was a square vestibule with parquetry flooring. No promenading is done in the room to judge from appearances, but there is an extensive balcony outside, whence the music can be heard, which answers the purpose. The internal decorations are of white and gold, with arched ceilings. Attached to the Kursaal is a very handsome newsroom, with large windows overlooking the grounds, parquetry flooring and handsome chairs and tables.

Wiesbaden.

This is another pretty town, which while standing at a lofty elevation, has a mild climate owing to its being surrounded by hills.

The Kursaal is a fine building, but rather dark. It is in the form of a parallelogram with pillars on both sides, and lit by large windows at either end and skylights in the roof. The floor is of parquetry, with sitting accommodation for 800, the gallery above accommodating an additional 350. No promenading or smoking is allowed in this room, and it is only used in winter and on wet days. There is in connection with it four reading-rooms, which are much frequented, and no fewer than 400 papers of all nations are taken in. There is also in connection with it a fine ball-room (which before 1873, when gambling was abolished in Germany, was used as a gaming-room), and large dining-rooms ; and we were informed that as many as 2,000 to 2,500 attended a fancy dress ball held there in the preceding winter.

In the grounds is a covered promenade, and one portion is fitted with all kinds of swings and games for children. There are also rows of small lock-up shops for the sale of fancy articles. The grounds are only separated from the public roads by railings, and the public may therefore enjoy the music free of charge, whilst the better class who may not wish to be unduly crushed can, by paying for the privilege, enjoy the music in the grounds.

The Council are not satisfied with the present Kursaal or concert-room, and are preparing for a new building more in accordance with modern requirements, which it is expected will cost £100,000.

Frankfort.

The principal place of entertainment is a handsome park, owned by a private company, and known as the Palm Garden. In the park is a concert-hall, but it is of secondary consideration only, and may be briefly described as a large and very lofty hall lit from the top and sides. A broad gallery for promenading, raised on pillars 17 to 18 feet high, goes round three sides of the hall. The flooring is of parquetry, and smoking is allowed all over. Although the hall must have cost a good deal of money, it does not appear to be much used, as the band during the season plays outside entirely. The principal attraction in addition to the band is the lovely grounds. The bedding out is of the most ornamental description, the colours being bright and pretty, and as the flowers decay they are replaced by others. There is also a wonderfully beautiful rose-garden. Roses of all sorts and colours in rich profusion are prettily arranged in groups and are also trained to form arbours and to grow round trees. Indeed everything of a permanent nature, even to the lamp-posts, is covered with roses. To keep the rose-garden clear of insects tobacco powder is used, and we were informed that this is found to be much more beneficial than any other thing that has been tried. The public are not allowed to walk on the grass, the verges being protected by curved iron hoops artistically formed to represent the branches of trees.

In addition to the above there is a large tennis-lawn, which, by a simple arrangement, can be flooded in the winter and used for skating. The ground round the lawn is raised 1½ foot, the grass growing well over the verges and being kept short like the lawn itself.

In the grounds are numerous artificial grottos, waterfalls and fountains and a large lake. As there is no natural stream to supply these, they use the old water over and over again, pumping it up by steam power. In consequence the water is somewhat dirty and unsightly. All the grounds are lit with the electric light.

Homburg.

The Kursaal is a magnificent building erected in the old gambling times. The rooms, which are all gorgeously painted

decorated, consist of a ball-room, dining-room, used in the time as a gaming-room; three reading-rooms and another ng-room overlooking the terrace. This dining-room with terrace is let for 1,700*l.* a year. Attached to the Kursaal covered promenade with marble and tiled floors. The menade is handsome but somewhat heavy.

Here again at the chief springs we noticed a very handsome ered promenade for the water drinkers. It is 100 yards and 8 yards wide, the roof being supported by pillars n either side. These pillars are made very pretty with bing plants. In this park also there is a rose-garden, the s being arranged in festoons and otherwise trained along rs and wires in a very pretty way.

Nauheim.

The Kursaal is on a large scale, and as in other places Germany, is a legacy from the gambling times. The cert-hall proper, which is immediately opposite the main ance, would be better described as a small theatre, and is bright and pretty. At one end of the building overlook- the garden is a large dining-hall with painted ceiling, and handsome mirrors all round the walls, and at the other is a reading-room. In addition to the above there are r reading-rooms, billiard-room, &c. 140 papers of all ons are taken in.

Baden.

The Kursaal here is another legacy from the gambling es. The principal concert-hall is in the shape of a paral- gram, decorated in white, blue and gold. It has a balcony ach end, parquetry flooring and verandah outside, where ple can promenade and hear the music at the same time. chairs are of a very light and pretty description, and have od deal of gilt about them. In connection with the concert- are many handsome rooms, including a large salle hand- ely painted and decorated, called the Hall of Flowers, and cipally used for dancing; a picture gallery, the pictures g on loan or for sale; billiard-rooms, ball-rooms, dining- ms, &c. The principal dining-room is let off for 750*l.* a r. In the park are several shops for the sale of ornaments. st of these shops belong to the town, and bring in a large enue.

Aix-le-Bains.

The Kursaal which was built in 1882 is a magnificently orated place, the accommodation being similar to the ers described, namely, theatre, concert-hall, dining-room, ling-rooms and gambling-rooms.

The Kursaal which cost some 120,000*l.* appears to be a l of joint-stock affair, divided into 320 parts or shares, on ch no interest or dividend is paid. The shares are held as ws :—Eighty belonging to the Government, twenty to the n, twenty to the charities, ten to the town of Chamburg, and to the general public. Whatever profit is made after ng expenses is divided and given half to the Church and to the poor.

Vichy.

The Kursaal or casino, as well as the baths and springs, are property of the State, and are leased to a company for 0*l.* per annum. In addition to this rental the company to keep in order the parks, light the town, and to give e concerts each week to the public, free. The Kursaal lf is nothing very special, the principal hall for music being ier small. The front of the Kursaal is all doors, with a ered terrace outside, and the people can sit either in or out ording to the weather, the hall being open to the garden. mbling is carried on extensively, not only in the Kursaal, but ll the cafés of the town.

TESSERÆ.

The Language of the Arts.

MODES of representing feeling pass away, even when the feelings themselves are innately human. The con- tional mask and representation of the Greeks become nged—we are too civilised for the simple, grand and some- t uncouthly vigorous forms of other days. We are not nout the genius that begets them—great things, grand and ple in conception and action—but we have other modes of ulging our fancy in them. In this respect literature has en place of the arts. The grand moral effect of pictures n the mass of people has passed away, and we doubt if it ever speak as it has spoken. We say not that grandeur is ttainable in the arts, far from it; but even that grandeur ch is inherent in all genius must invent itself new ways, and st upon the world, unconnected with what has gone before, manner, and perhaps in a style, that none can beforehand ct, and of which even the highest genius is as yet uncon- us. In other ages architecture and painting were the great book, as it were, which a whole people read; they had little other direct appeal to them. The appeal was with force and awful authority. It was practically as the Bible, before they had that in their hands to look to—the embodying and making palpable great moral and divine truths. Cathedrals spoke visibly, mankind were made greater by feeling a grandeur above themselves; they habitually felt the awe of genius, and genius then had scarcely another mode of speaking to the world. And great was the language of architecture and paint- ing; nor was the effect lessened by other distractions and other modes of speaking. Printing and diffusion of letters, the very circulation of the sacred book, have increased the re- sources of all civilised people. Among many voices, the one once so great and powerful is less heard. The language of architecture and painting has, if the expression be allowed, lost its divinity.

Gavelkind.

Gavelkind is, strictly speaking, a tenure, not a customary mode of descent. There are many places in and out of England where lands have immemorially been divided among all the sons, and indeed it was long before the doctrine of primogeniture was generally established in England. It was not till the reign of Henry III. that an ordinary freehold, not being held by military service, descended as a matter of course to the eldest son. In the West of England, and notably at Exeter, Wareham and the Isle of Portland, as well as in Norfolk, Suffolk and Nottinghamshire, it was usual to divide land on descent. Yet in none of these places was the name of gavel- kind heard until, in the sixteenth century, the judges, by giving special prominence to the most startling of the customs of Kent, introduced the habit of calling everything gavelkind which involved partability of land. Gavelkind was really the ancient law of socage tenements in Kent, and the free tenants, who held portions of Kentish manors by payment of rent or performance of general services of husbandry, were the "men of gavelkind." The Conqueror guaranteed the preservation of their laws, and in order that the powerful barons and knights might not buy up the freeholds and extinguish the peculiar tenure, it has been a maxim of the law, from the earliest Norman reigns to the present moment, that all land in Kent shall be presumed to be subject to gavelkind till the contrary is proved. There was no hardship in this to the feudal tenants whose military lands were always registered by the officers of the Exchequer, and there was great safety to the inferior tenants. Even before the Conquest the estates of these "gavelmen" or yeomen (they were much in the position of the Cumberland "statesmen") were kept apart from the estates of the gentry, and it was easy, as far as appears in the most ancient Saxon times, to specify which land belonged to gavelmen and which to the thanes. The first lands of the higher degree were held allodially by the king, the Church and the nobles. The lands of the gavelmen were held as petty freeholds by the rural tenants, who paid their rent in kind or in labour. When the rent was in kind it was called gavel-honey, corn-gavel, gavel-rafter and the like, and it is said that the name of the last remains in the gable end of houses, that portion being often built with the materials of the tenants who owed gablum or rent. In the Isle of Thanet the farms are still distinguished as corn-gavel and penny-gavel lands. At the Conquest the state of things in Kent was not much dis- turbed. There was a change of owners without a change of boundaries. In other words, the Norman baron or knight stepped into the place of the ejected thane, and received from the tenants of his manor precisely the same rents and services as his predecessor.

Clustered Columns.

The clustered column is one of the most prominent features of a Gothic vaulted room, and is therefore always set forth as a leading characteristic of the style. But the clustering of a pier is not merely a kind of enriched fluting, for every shaft and moulding which compose it bears a definite relation to the parts which lie above it, every one of which receives, in the decorative sense, an independent support from some member of the cluster. And notwithstanding the apparent variety of these groups, a remarkable degree of system may be detected by the comparison of them. If it were merely for the illustra- tion of the subject, it would be worth while to attempt to recover the laws and rules by which this system was governed; but when we discover in addition to its uniformity in one age and country that it was practised in different manners in different ages and countries, that its various parts may be traced from different districts, some from the earliest ages, others of later invention, the whole being gradually brought together with increasing complication, a new interest is excited, and the investigation becomes absolutely necessary to the history of architecture. We have said, "recover the laws," because the possibility of detecting them proves that they were recognised by the artists, and there is no doubt that the parts of Gothic decoration were as well defined in their own age as the division of a Roman entablature into architrave, frieze and

cornice, which, had Vitruvius been lost, we must have picked out for ourselves from a comparison of examples. Clusters are largely employed for the support of arches, as in rich doorways or the pier arches of churches. An archway of this kind may either be considered as a single arch decorated with a quantity of mouldings disposed in succession on its slanting surface and supported by a group of shafts and moulded pier-edges, or it may be resolved into a number of concentric archways successively placed within and behind each other. When these arches are considered as a whole, the variety of them appears so great and the decoration so various that no systematic description can be applied to them, and as many drawings therefore as there are examples are required to convey an accurate idea of them; but by dividing them into separate arches it will be found that the treatment of these is reducible to a few simple principles, of which a correct idea may be conveyed by figures, and that it is by variously combining these arches that so many different ones are produced, all of which may easily lend themselves to the language of description when the elementary notions are thoroughly acquired.

Greek Libraries.

Amongst the Greeks, as amongst other nations, the first libraries consisted merely of archives deposited, for the sake of preservation, in the temples of the gods. The sacred books, of which mention is made by Dionysius of Halicarnassus under the denomination of Deltids, were of this description. It has been often said that Pisistratus the tyrant was the first who established a public library in Athens, but the statement rests mainly on the testimony of Aulus Gellius, who wrote about 700 years after the time of Pisistratus. In this alleged library the founder is said to have deposited the works of Homer, which he had collected with great difficulty and at a very considerable expense, and the Athenians themselves were at great pains to increase the collection. The reputed fortunes of this library were various and singular, if true. It was transported to Persia by Xerxes, brought back by Seleucus Nicator, plundered by Sylla, and at last restored by the Emperor Hadrian. The entire story, however, is a conjectural one. That Pisistratus was a promoter of learning, and that he rendered eminent service by his Homeric researches, is incontestible. But that he formed anything which even remotely resembled a library, in the ordinary meaning of the term, is an assertion unsupported by adequate evidence, and just as little foundation is there for the romantic vicissitudes which complete the tale. Nor is there much better authority for the statement that when, on the invasion of the Roman Empire by the Goths (A.D. 260), Greece was ravaged, and in the sack of Athens they had collected all the libraries, and were upon the point of setting fire to this funeral pile of ancient learning, one of their chiefs, interposing, dissuaded them from the design, observing at the same time that as long as the Greeks were addicted to the study of books they would never apply themselves to that of arms. Strabo has stated that Aristotle was the first known collector of a library, and that to him was also due the honour of having suggested to the Ptolemies the formation of that great collection, which was scarcely more the wonder of antiquity than it has been the conundrum of modern scholarship. Aristotle bequeathed his library, with many of his own writings, to Theophrastus, who appears to have made considerable additions to it, and who, in his turn, bequeathed it to Neleus. The latter, according to Strabo, carried the collection to Scepsis in the Troad, where it subsequently fell into disorder, and was at length concealed in a cave, that it might escape the eager researches of the kings of Pergamus. "At length," continues Strabo, "but not before the books had been injured by damp and worms, they were sold to Apellicon of Teos—rather a collector than a philosopher—who, by unskilful attempts at the restoration of defective and mutilated passages in the writings of Aristotle, increased the injury by corrupting the text." On the capture of Athens by Sylla, the library of Apellicon—not that of Pisistratus—was seized by the conqueror and carried to Rome.

Piers and Shafts.

The various styles that immediately succeed the Classical are distinguished from each other principally by the different manner of using shafts, which in some styles are mere accessories, in others real supporters of weight. Thus in the interiors of the Christian Roman and Pisan churches the walls entirely rest on bearing shafts, and there are no compound piers. In the Romanesque of Lombardy and of the Rhine compound piers are universal, and often alternate with bearing shafts; and in the South of France the compound piers are used alone, and the bearing shafts employed are confined to the apsis. In the Byzantine, the principal feature of which is the mode of roofing by domes and waggon vaults, we find huge piers with their faces decorated with tiers of arches, but the shafts are confined to the support of decorative arcades, and hold no essential place in the mechanical structure, except in some smaller specimens, as at St. Fosca, Torcello, where they are placed under the arches that support the dome. There are no genuine compound piers, and the introduction of the essential feature of the Gothic appears due, therefore, to one of the Romanesque styles. In the Early Norman there is much greater massiveness and rudeness than in any other; their builders are fond of employing bearing shafts of two or three diameters in height, and their piers when compound are more complex than those of their contemporaries. Considered in the order of art, the Pisan style holds undoubtedly the first rank, from the classical beauty and elegance of their sculptured ornaments and mouldings. Of all the Romanesque styles, that of the South of France appears to possess the most simplicity and plainness of decoration, and yet the greatest complication of plan. Here, too, pilasters are used in the interior, of so Classical an appearance that if these were not pretty universal one should be tempted to believe them subsequent interpolations. They are fluted, sometimes with zigzag flutes, or else decorated with arabesques or sculptured mouldings; examples of them occur in the triforium and apsidal aisle of La Charité sur Loire, in the triforium of the choir of Lyons, and at Autun and Clugny. In the dispositions of the smaller shafts the angle-shafts afford a ready characteristic: these are susceptible of two modes of application, as edge-shafts and nook-shafts. The first kind are used in the Byzantine, South of France and Norman styles, the second in the Lombard, while in the Romanesque of Germany both kinds appear. The edge-shafts are introduced with much the greatest profusion in the Norman style, and to this belongs the introduction of them on the edges of the compound piers where they are never placed in any other style. Hence arises a greater richness and multiplying of parts in the piers, which led the way to the elaborate compositions of the Early period.

GENERAL.

Mr. J. Williams Dunford, architect, has been elected member of the Walthamstow Council as representative of the Wood Street ward.

The Metropolitan Asylums Board on Saturday adopted the preliminary plans for the erection of the proposed South Hospital, and it was ordered that they be transmitted to the Local Government Board for consideration prior to the completion of finished drawings.

The Fund for the Leeds Church Extension Scheme now reaches 30,000*l.* towards the 100,000*l.* required. Mr. W. Jackson and Mr. W. H. Kitson have each given 1,000*l.*, and there are several additional subscriptions of 500*l.* and downwards.

Mr. F. W. Pomeroy is making satisfactory progress with the statue of Mr. Gladstone, and it, as is hoped, the work completed by the end of this year, the memorial will be veiled in the Central Lobby of the Houses of Parliament the opening of next session.

The Greek Government have appointed a committee arrange for the construction of a pavilion in which the products of the country will be shown for the Paris Exhibition of 1900. The plans, prepared by an Athenian architect, have received the approval of the authorities of the Exhibition.

M. Rodin, the French sculptor, proposes to open a special exhibition of his own works in 1900 if the French Government will grant him a site for a temporary building.

The Late Dr. W. H. Willshire has bequeathed to the Corporation of London, for the Guildhall Library, his collection of books, prints and playing cards, and the cabinets and frames containing them.

Visitors to Barbizon, which is the abode of many French painters who have followed Millet's example, will shortly have the advantage of a tramway connecting the village with Melun.

The Loan Exhibition in the art gallery of the Guildhall, which is now being arranged, will be open on Sunday afternoons as well as on weekdays.

Mr. Paulton, M.P., asked the First Lord of the Treasury on Friday whether he was aware that, in the process of decorating St. Paul's Cathedral with Byzantine mosaics, the lettering and stencilling in red paint, the original stonework had been cut away to make room for the mosaics, and whether, having regard to the importance of preserving intact the architectural and artistic features of this great national monument, he will use his influence to assist in having inquiry made into the subject of the injury alleged to be caused in these respects by carrying out the present scheme of decoration. Mr. Balfour, in reply, said the Government had no power either of control or advice in the matter. He felt certain that the great artistic authorities who were concerned in the work of decorating St. Paul's Cathedral would feel, as everybody must feel, the great importance of preserving the historic structure unimpaired.

rchitect and Contract Reporter

IMPORTANT NOTICE.

ORKMEN'S COMPENSATION ACT.

view of the many difficulties which are certain to in connection with the law, practice rules and dure under the above Act, we have added to our A VERY EMINENT BARRISTER, who has made ubject a special study, and will be glad to answer e columns of this paper any questions relating to omplicated matters arising from the provisions of difficult Act. Our LEGAL ADVISER will further er any legal question that may be of interest to readers. All letters must be addressed "LEGAL ISER," Office of "The Architect," Imperial Build- Ludgate Circus, London, E.C.

EDITORIAL NOTICES.

uthors of signed articles and papers read in public must ecessarily be held responsible for their contents.

mmunication can be inserted unless authenticated by the ame and address of the writer—not in every case for ublication, but as a guarantee of good faith.

spondents are requested to make their communications brief as possible. The space we can devote to Corre- bondence will not usually permit our inserting lengthy mmunications.

TENDERS, ETC.

s great disappointment is frequently expressed at the non- ppearance of Contracts Open, Tenders, &c., it is par- cularly requested that information of this description be rwarded to the Office, Imperial Buildings, Ludgate rcus, London, E.C., not later than 2 P.M. on Thursdays.

NEW READING CASE.

Librarians of the Public Libraries and Reading- .—A new handsome Reading Case can be supplied nominal charge of 2s. by post 2s. 6d., on early ation to the Publisher, Imperial Buildings, Ludgate , London, E.C.

For Advertisement Scale, see page xiii.

COMPETITION OPEN.

ADFORD.—April 14.—Designs will be invited for the n of the Bradford Corporation Cartwright Memorial t a cost of 38,000*l.* Three prizes will be offered, value 00*l.* and 50*l.* respectively. Particulars will be found in r column.

CONTRACTS OPEN.

BEXHILL.—April 22.—For erection of three police constables' cottages adjoining the county police station. Mr. F. J. Wood, county surveyor, County Hall, Lewes.

BRADFORD.—April 11.—For erection of chapel and schools, &c., in Carlisle Road and Drummond Road, Manningham. Mr. J. Ledingham, District Bank Chambers, Bradford.

BREAMORE.—May 1.—For erection of bridge over the river Avon at Breamore, Hants. Mr. W. J. Taylor, county surveyor, The Castle, Winchester.

BRIGHOUSE.—April 8.—For erection of retort-house and coke-tower at the Brighouse Gasworks, Mill Lane, for the gas committee. The Engineer, the Gasworks, Mill Lane.

BRISTOL.—For additions and improvements to Kingswood Church. Mr. E. H. Lingen Barker, architect, 15 Bridge Street, Bristol.

BRISTOL.—April 5.—For erection of a rope factory, &c., Bath Road, Arno's Vale. Mr. Henry Williams, architect, 24 Clare Street, Bristol.

CARDIFF.—April 8.—For completion of the Hayes End of the Morgan Arcade, Cardiff. Messrs. James & Morgan, Charles Street Chambers, Cardiff.

CARDIFF.—April 18.—For erection of a stable, for the Great Western Railway Company. Mr. G. K. Mills, secretary, Paddington Station, London.

CARLISLE.—April 14.—For completion of a school, out-offices, boundary walls, teacher's house, &c., at Botcherby. Mr. A. W. Johnston, architect, 81 Castle Street, Carlisle.

CHELSEA.—April 18.—For reconstruction of the two bath turrets at the infirmary in Cale Street. Mr W. M ller, clerk, 250 King's Road, Chelsea, S.W

CHESHIRE.—April 11.—For erection of six cottages near Helsby station, for the joint committee of the London and North-Western and Great Western Railway Companies. Mr. A. E. Bolter, secretary to joint committee, Paddington.

CUMBERLAND.—April 4.—For altering and renovating Clifton parish church. Mr. James Howes, architect, Workington.

CUMBERLAND.—April 5.—For alterations and additions to the Roman Catholic schools, Egremont. Mr. J. S. Stout, architect, Gillfoot, Egremont.

DERBY.—April 10.—For extensions to the electric-lighting station. Mr. Arthur Eaton, architect, 6 St. James's Street, Derby.

DURHAM.—For erection of seventeen self-contained dwelling-houses (brick) at Stella. Mr T. C. Nicholson, architect, Blaydon-on-Tyne.

DURHAM.—April 7.—For erection of the Ushaw Moor Wesleyan chapel at Ushaw Moor, near Durham. Mr. J. Walton Taylor, architect, Newcastle-on-Tyne.

DURHAM.—April 11.—For erection of the Johnston Electric School. Messrs. Oliver & Leeson, architects, Bank Chambers, Mosley Street, Newcastle-on-Tyne.

EVEN SWINDON.—April 8.—For erection of Primitive Methodist chapel in Rodbourne Road. Messrs. William Drew & Sons, architects, Victoria Street, Swindon.

FLEETWOOD.—April 4.—For construction of an underground convenience and other works. Mr. Joseph Tildesley, clerk, Town Hall, Fleetwood.

FORFAR.—April 8.—For erection of two cottages respectively at Glenprosen and Clova. Mr. D. Ross, surveyor, Kirriemuir.

GATESHEAD.—April 13.—For rebuilding the Foresters' Arms, Askew Road. Mr. A. G. Kyle, architect, 145 Pilgrim Street, Newcastle.

STURTEVANT SYSTEM
OF WARMING AND VENTILATING.
IVE CIRCULATION OF PURE WARM AIR. NO RISK OF FIRE.
PERFECT CONTROL OF TEMPERATURE.
TEVANT ENGINEERING CO., 75 QUEEN VICTORIA ST., LONDON.

GREAT YARMOUTH. — April 4. — For alterations and additions to Northgate school. Messrs. Bottle & Olley, architects, Queen Street, Great Yarmouth.

GREAT YARMOUTH.—April 8.—For additions to the Devonshire Hotel, Howard Street. Mr. Chas. G. Baker, architect, Great Yarmouth.

HALIFAX.—April 6.—For erection of an iron foundry, with workshops and offices, in Albert Road, near reservoir. Messrs. Jackson & Fox, architects, 7 Rawson Street, Halifax.

HALIFAX.—April 12.—For erection of sixteen houses on the Newstead Estate, Gibbet Lane. Mr. W. Clement Williams, architect, 29 Southgate, Halifax.

HALIFAX.—April 15.—For erection of dwelling-house and shoeing forge in Westgate. Messrs. Chas. F. L. Horsfall & Son, architects, Lord Street Chambers.

HASTINGS.—April 3.—For erection of stabling, loose-boxes, &c., at Rock-a-Nore Vine Farm, St. Helen's, and Silverhill. Mr. Ben. F. Meadows, town clerk, Hastings.

HULL.—April 5.—For construction of two river walls and contingent works, at the St. Andrew's Dock entrance, for the North-Eastern Railway Company. Mr. T. M. Newell, engineer, Dock Office, Hull.

IPSWICH.—April 13.—For erection of an addition to one of the wings of the new workhouse. Messrs. Salter & Adams and W. L. Newcombe, architects, Board Offices, Tower Street, Ipswich.

IRELAND.—April 8.—For erection of a church at Durrus, co. Cork. Mr. M. A. Hennessy, architect, 74 South Mall, Cork.

KEIGHLEY.—April 10.—For erection of foundry and other buildings in Bradford Road. Messrs. W. H. & A. Sugden, architects, Keighley.

KENDAL.—April 10.—For converting Old Zion chapel into Sunday schools. Mr. Stephen Shaw, architect, 45 Highgate, Kendal.

KIRKBY-IN-ASHFIELD.—For erection of schools. Mr. Lawrence Bright, architect, 9 St. Peter's Church Walk, Nottingham.

LANCHESTER.—April 5.—For construction of a bridge over New House Burn. Mr. W. H. Ritson, clerk, Lanchester, Durham.

LENBOROUGH.—April 8.—For erection of a farmhouse or the Lenborough Estate, near Buckingham. Mr. W. H. Castle surveyor, Town Hall, Oxford.

THE Berkefeld Filter Company, Limited, inform us that all dining, luncheon and kitchen cars of the new Great ral Railway have been fitted out with Berkefeld filters.

PLANS for the new post-office for Ormskirk have been pre- d by Mr. John Riding, architect. The selection of tenders he work will take place in a few days, and a start will be e as early as practicable. The new premises, which are to rected in Aughton Street on the site of very old buildings, not far from the present office on the Cross, are as central ould in the circumstances have been obtained, and the ion meets with the approval of the majority of the business le, a counter petition in favour of a site in Burscough et having failed. The frontage will not be imposing or of rnamental character, but the convenience and aptitude in rd to the internal arrangements will be highly satisfactory. new plans provide for a large sorting-room, telephone and raph, female clerks' and other rooms, and attached to the will be the postmaster's house.

TENDERS.

THE CHEAPEST SUBSTANTIAL RELIEF DECORATION.

LONDON WAREHOUSE 92 & 93 GREAT RUSSELL ST. W.C.

Soho Cowl & Ventilator

(NICKLIN & MILWARD'S PATENT).

This COWL has been used as a Ventilator, both on Workshops and Offices, with most satisfactory results, and has proved a conspicuous success as a Hose Cowl, possessing as it does great suctional power, perfectly noiseless action and great durability, being made of steel.

The COWL has proved a perfect cure in the case of most troublesome chimneys.

TESTIMONIALS.

"I consider your cowl far above any other cowl in the market, and have much pleasure in recommending it to anyone suffering from smoky chimneys."

"Forward the 10-inch cowls on order at once; we have fixed the others and find they give every satisfaction."

"Your cowl has proved a complete success, no matter which way the wind blows. Please forward me another one at once."

THE county borough of West Ham, having acquired the Rookery Farm at Dagenham, Essex, 116 acres in extent, have isolated a space of 3¾ acres on which they have erected a smallpox hospital, from designs prepared by Mr. Lewis Angell, the borough engineer and architect. The hospital comprises an entrance lodge and offices; an administration block, including the medical officer's and matron's rooms, twenty-eight bedrooms for nurses and attendants, mess-rooms, dispensary, kitchen, laundry, and other offices; two pavilions containing four wards, each ward 60 feet long by 26 feet wide, also a receiving-room, bath-rooms, nurses' duty-rooms and sanitary annexes; isolation block for four beds and offices; discharging block, laundry, disinfecting chamber and mortuary. The hospital will accommodate forty-four patients and necessary staff. The materials used are stock bricks, with Portland stone and red brick dressings. The buildings have cost about 17,000*l.*, exclusive of site. Messrs. Gregar & Sons, of Stratford, were the contractors.

Aspinall's Wapicti

The only perfectly successful Washable Distemper Paint. Guaranteed to stand on New Plaster. Proved and adopted by London County Council and Principal Public Bodies at Home and Abroad.

Architects and others interested should inquire as to this before specifying for New Work.

ASPINALL'S ENAMEL, LIMITED.
NEW CROSS, LONDON, S.E.
See our Stall at Building Trades Exhibition, April 26 to May 6.

TRADE NOTES.

MESSRS. E. H. SHORLAND & BROTHER, of Manchester have just supplied some more of their patent Manchester grates to the Girls' Intermediate Schools, Cardiff.

ADDITIONS are being made to the Larbert Imbecile Institution (Messrs. A. & W. Black, of Falkirk, architects), and special attention is being given to the ventilation, which is being carried out by means of Cousland's improved "Climax" patent direct-acting invisible roof-ventilators, supplied by the "Climax" Ventilating and Heating Company, Limited, sole manufacturers, 93 Hope Street, Glasgow.

MR. JOSEPH BLACKBURN, of Gresham Works, Nottingham, informs us that he has made arrangements for the introduction of further working capital into his business by converting it into a private limited company, and has registered same as "Blackburn, Starling & Co., Limited," which will be advertised during the week. No change will be made in the management of the various departments, nor will any shares be publicly offered.

THE Catholic College of St. Cuthbert, Ushaw, Durham, which stands on a bleak eminence overlooking Beaurepaire (or Bear-park), was founded by Dr. Gibson, the Catholic bishop, in 1804, for refugees escaping from France during the Revolution. It is now a seminary for Catholic students, and was enlarged in 1849. The chapel was designed by the late A. W. Pugin, and the library contains about 50,000 volumes of books. To commemorate the restoration jubilee, a new illuminated turret quarter-chime clock, showing the time upon two external dials, is now being erected by Messrs. Wm. Potts & Sons, clock manufacturers, of Guildford Street, Leeds, and Newcastle-on-Tyne, from orders received from the committee. Messrs. Wm. Potts & Sons are also fixing four new illuminated dials, 7 feet each in diameter, at the Town Hall, Darlington, co. Durham, for the mayor and corporation. The mayor and corporation of Carlisle have also given instructions to Messrs. W. Potts & Sons to make and fix a new illuminated clock at the Town Hall, Carlisle, new illuminated dial and clock at Christ Church, restore Holy Trinity Church clock and clean the Corporation large clocks at the markets and free library. Messrs. Potts have the above now in hand.

THE recent great fire at the Hotel Windsor in New York once more brings to the fore the great necessity for having these establishments properly protected from sudden outbreaks of fire. It is very satisfactory to learn that most of the principal hotels in England are fully equipped with the latest and best fire-extinguishing plant, but it does not necessarily follow that the employés at these hotels know either where they are kept or how to use them when found. It is therefore a matter of the most vital importance that some organisation should exist among the members of the staff. Some responsible employé should be appointed as "captain," and it should be his duty to see that every employé, male and female, is acquainted with the best way in which to use the fire-fittings should a fire at any time take place. Occasional "parades" should be arranged and fire-drill gone through, utilising the apparatus which would be employed at an outbreak. Every employé should have his or her definite fire duty to do, so that no confusion need arise at a time when every moment is precious, and when the value of perfect discipline is most appreciated. Every member of the staff must know how to use the "Chute" fire-escapes, which should be found in every hotel, and which are such excellent means for rapid and safe egress from a burning building. Among the hotels and clubs which have followed this system under the supervision of Messrs. Merryweather & Sons—who send experts to keep the staff and fire appliances in an efficient and ready state—may be mentioned the Bath Hotel, the Berkeley Hotel, Charing Cross Hotel, Carlton Club, Café Royal, London, the Reform Club and many others. We can only hope that their example will be followed by other proprietors for their own sakes, as well as for the safety of the travelling public.

ELECTRIC NOTES.

THE electricity committee of the Manchester Corporation have received the sanction of the Board of Trade to their proposal to supply electrical energy to the districts of Levenshulme, Moss Side and Withington on what is known as the extra high pressure principle. Under this system a maximum pressure of 500 volts will be reached. The electrical energy will be transmitted at this voltage to distributing stations in the area of supply, and there transformed into a low-pressure direct continuous current. The communication from the Board of Trade sanctioning the application was read at a recent meeting of the committee.

JAMES W. BUTLER, Manager and Secretary.

A new system of incandescent electric light has been evised by Professor Nernst, of Gottingen. It is stated that he light produced requires neither vacuum nor tender fila- ents. The essential point of the invention is that when agnesia is heated above 3,000 deg. C. (a temperature far bove the melting-point of platinum) it becomes a good con- uctor, and a very weak current is sufficient to keep it in an tensely luminous condition. As advantages over the ordinary candescent lamps Professor Nernst claims that the same mount of light can be furnished at one-third the cost, and at, as the magnesia allows of being heated to a much higher egree than a carbon filament, a purer light is obtained. At he Society of Arts meeting last Wednesday lamps of Dr. Nernst's invention were exhibited which shone like little suns, nd were urged by currents so intense that any type of lamp present in use would have been destroyed at once. The eculiarity of the invention, as stated above, is that the filament replaced by a rod, not of carbon, but of metallic oxides. Dr. ernst at first tried magnesia and lime, but has lately substi- ted for these the same materials as are used in the Welsbach antles, thereby adding greatly to the luminosity. Another ature of these lamps is that they do not require to be enclosed a vacuous bulb, and, strangest of all, they need the aid of match or spirit lamp to start them. This last condition is not r the ordinary purpose of kindling anything, however. The ason is that the cold rod has a resistance so great as to rbid the passage of a current along it, so that merely turning e switch produces no result; but when the resistance is suffi- ently diminished by heat the lamp lights up brilliantly. It mains to be seen whether the invention will prove a com- ercial success.

At the monthly meeting of the Bettws-y-Coed Urban istrict Council, a report which was presented by a committee residents who had been appointed by a public meeting to port upon the advisability of carrying out an electric-lighting heme for Bettws-y-Coed, set forth the opinion of the com- ittee that the only available water supply for the purposes of local instalment was the Swallow Falls. An instalment could e put down, including building and the "wiring" of the strict, for less than 2,000*l.* They believed that by using the ater power from the falls the electric energy could be supplied consumers at 5*d.* per unit, with a substantial margin, if the arl of Ancaster would grant the necessary permit at a nominal nt. The report further advised the ratepayers to authorise e Council to employ Messrs. Gilbert Gilks & Co., Kendal, to report upon the scheme, at a fee of 10*l.* 10*s.* Mr. E. Davies Jones considered it was inadvisable to utilise the Swallow Falls for such a purpose, as it was one of the sights of Bettws- y-Coed, and it was better to have no electric lighting than to detract from the beauty of the falls. Mr. Rowlinson said that if their gasworks were not such a rotten affair, the electric light would be unnecessary. The Chairman fully concurred in the importance of doing nothing that would detract from the beauty of the falls, which were such an attraction to visitors. Mr. R. Pullan moved that the electric-lighting question be deferred for the present. Mr. E. Davies Jones seconded and it was carried.

VARIETIES.

The Prince of Wales has consented to lay the foundation-stone of the new Post Office Savings Bank building at West Kensington. The ceremony will probably take place in June.

A valuable antiquity has just been presented to the Canterbury Museum in the shape of a chair, stated to be the authentic chair used by St. Augustine in the sixth century.

New schools in connection with Chapel Lane Unitarian chapel, Bradford, which have been built on the site of the old schools, have been opened. The cost of the schools is 1,700*l.* The buildings include an assembly hall called the Channing Hall, which has been added as a memorial to the late Dr. Channing.

At its first meeting after the Easter recess the London County Council will be advised by its improvements committee to contribute one-fourth of the net cost of widening Lower Thames Street to 60 feet between Botolph Lane and Fish Street Hill. This contribution is estimated at 50,000*l.*

The Edinburgh Architectural Association visited on Saturday afternoon last four houses now in course of completion at Mortonhall Road. The plaster-work in these houses is exceptionally interesting. The leader, Mr. Harold Tarbolton, architect, who modelled the decorative plaster-work, referred to the difficulty experienced by architects in securing good modellers, and urged the Edinburgh plasterers to assist architects in this matter, as the ability to carry out good work would create a demand for it. The party then visited Grange House.

Mr. Aston Webb, architect, has been elected an Associate of the Royal Academy. The new Associate is a son of the late

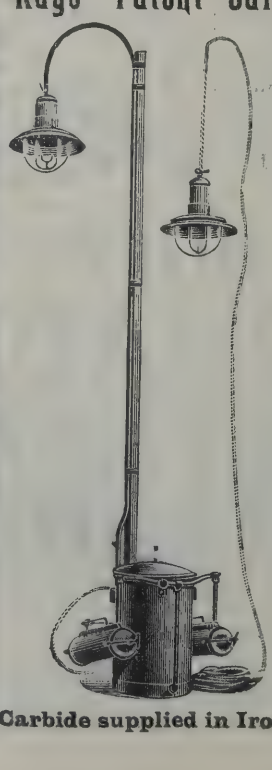
Mr. Edward Webb, engraver and water-colour painter, was in 1884 president of the Architectural Association, and is a vice-president of the Royal Institute of British Architects. His name is associated with churches and public buildings, not only in London, but in many parts of the country as well He is the architect for the completion of the South Kensington Museum, and, with Mr. Ingress Bell, designed the new schools of Christ's Hospital.

IN the course of extensive alterations at a shop in Dudley Street, Wolverhampton, the workmen came upon a circular opening at the end of the cellar beneath the shop floor. On passing through the opening several of the workmen saw an ancient well, with an old iron ladder of seventy rungs reared up to the top of it. At a depth of 85 feet was a bricked chamber, and at a higher level was a low brick-lined passage 45 feet long, and terminating underneath the South Staffordshire Brewery in Market Street. A few months ago a deep well was accidentally discovered in the same street, and ancient wells with secret passages were found when making excavations for the Empire Music Hall.

THE new chapel which has been erected to meet the wants of the rapidly-increasing Primitive Methodist community in Oswestry was formally opened on the 13th inst. The building will seat 425 people, and it has been erected at a total cost of 1,600*l*., from the designs of Mr. J. D. Mould, of Manchester. The builder is Mr. Jabez Higgins, of Oswestry. The electric light is installed throughout, and the building is heated by means of hot-water pipes.

A GOVERNMENT proposal to erect a police-station on the outer moat of Castle Rushen, a fine Manx fortress 700 years old, was referred to a committee of the Legislature, and the committee have reported disapproving of the site. They say:—"The Manx people are justly proud of Castle Rushen, the ancient historic monument of this ancient kingdom. We think the people would prefer to incur the expense of a new site rather than that the castle should not be seen in a manner worthy of its grandeur and importance."



THE Ayr Town Council met on the 16th inst. to consider and, if so resolved, to confirm the recent resolution of the Council to acquire a part of the Boswell Field, Sandgate Street, in which to erect a new town hall. The site was to cost 4,200*l*., and the hall was estimated to cost about 23,000*l*. After discussion Provost Templeton moved, seconded by Dr. Naismith, that the resolution to acquire the Boswell site be confirmed. Bailie Smith moved an amendment in opposition which was seconded by Mr. William Lamb. On a division the amendment was carried by eight to seven—that the site be not acquired. A petition from about 100 ratepayers was laid on the table asking that the hall be rebuilt on the old site.

WHEN the bicentenary of the building of the Rawdon Friends' Meeting-house was celebrated in 1897, it was decided to commemorate that interesting event by doing something to improve Rawdon School and raise its scientific equipment nearer to the standard of modern educational requirements. A new laboratory was planned, with a workshop for the boys and music-rooms for the girls. A new gateway and improved approach also entered into the memorial scheme, which further provided for the introduction of hot-water heating apparatus throughout the school. The foundation-stone of the proposed wing was laid on June 4, 1898, and on Saturday afternoon this new wing was formally opened.

THE Director of Antiquities and Fine Arts in Tunis has undertaken a series of excavations which have led to important discoveries. After having penetrated below the upper strata, which contained tombs and mosaics of the Byzantine epoch, a colossal head of Marcus Aurelius was found, together with two large mosaics, one representing Venus and the other a race between armed horsemen. These mosaics covered a tomb, into which a door opened. In the tomb a number of statues of priestesses were found, and eight or nine statuettes. In addition forty tombs of the Punic epoch, containing Carthaginian vases, ostrich eggs and collars of precious stones, were found. The excavations are still going on.

A PUBLIC wash-house, erected by the Corporation of Glasgow for the Townhead district of the city, at a cost of about 5,000*l*., was opened on Friday last. The building, situated in Kennedy Street, is a substantial one of red sandstone, and is fitted up with fifty washing-stalls, several washing-machines driven by hydraulic power, and ample hot-air drying apparatus. Each washing-stall has a raised tub for washing smaller articles of clothing, and a lower and larger one for the tramping of blankets and heavier articles. A charge of 2*d*. per hour is made for each stall. All that the owner of the washing has to supply is soap and the labour. The drying apparatus is so effective that the washerwoman is enabled, very shortly after the washing process is completed, to carry off the clothes perfectly dried.

CATHEDRAL SERIES.—DURHAM: GALILEE, LOOKING SOUTH-EAST. GALILEE FRESCO, ALTAR OF OUR LADY OF PITY.

THE QUEEN OF HOLLAND'S WORK-ROOM, AMSTERDAM.

147 HARLEY STREET.

THE large new hall and other premises which have been n course of erection during the past year in connection with Jnion Street U.P. church have been recently opened. The hall ias a handsome frontage to Union Street, immediately adjoin- ng the church, and forms a valuable and much-needed addi- ion to the resources of the town. It is capable of accom- nodating an audience of 450, and for ordinary purposes is ivided by folding doors into two smaller halls of different size. The partition doors fold back into a recess on each side of the all, and form no obstruction when the whole hall is used. Behind it are a large new session-house, cloak-rooms, and other ccommodation. The cost has been about 2,000*l.*

HIGH STREET CHURCH, Bolton, which has for some time een closed for redecoration and the installation of the electric ght, was reopened on the 12th inst. The body and gallery of ne church are now lighted by five 7-light coronas, and the hoir gallery by two 4-light coronas. Separate screen lights re provided for the organist and pulpit. The entrance and estibule have floral wrought-iron cylinder fittings. The large choolroom is illuminated by two 10-light coronas, of similar esign to the church, and the whole of the vestries and class- ooms have been relighted with fittings of a chaste design. The controlling switch and distribution boards are of a special esign, being sunk flush with the wall and mounted on namelled slate bases, with glass front panels, ivory labels eing provided to denote the separate controlling switches. No pains or expense have been spared by the chapel trustees o make the relighting both artistic and effective. The decora- on of the ceiling is of Italian design, formed into nine panels, ith moulded cornice. The whole of the ceilings have been lined with paper and then painted, and finished in ivory white and light fawn. The cornice and enrichments have been picked out in subdued colours to harmonise.

ADDINGHAM CHURCH, after undergoing restoration, has now been reopened. Messrs. Oliver & Dodgshun, Carlisle, were the architects employed in the restoration, and the work done, which cost about 500*l.*, is as follows:—The chancel has been reroofed entirely, and it and the body of the church have been reseated. The inner roof of the chancel is of oak, as also are the new choir stalls, the pulpit, &c. A new inner ceiling with Canadian redwood mouldings has been placed underneath the old roof of the nave, taking the place of the old flat ceiling, and in the reseating of the nave much of the old oak, of which the old seats were largely made, has been reused. The arch which now divides the chancel from the nave is an old arch which was discovered underneath the lath and plaster orna- mental arch which was put in about the beginning of the present century, and which has been demolished. The sanctuary is paved with black and white Frosterley marble, and the chancel has been repaired with blue and grey stone. The vestry roof has been raised and a new organ chamber has been formed by taking down part of the north wall of the chancel, and to that chamber the organ has been moved from the south side of the chancel.

IMPORTANT new schools and laboratories have just been completed in connection with the Middlesex Hospital, and form the most recent and best-equipped additions to institu- tions for medical instruction in London. The authorities have recognised the importance of affording to those who carry on the medical and surgical treatment of the great number of patients received into the wards every opportunity of utilising all the most modern methods known to science for the investi- gation and cure of disease. In the construction and general arrangements of the buildings no pains have been spared to fulfil these conditions. The walls and floors are made of smooth, non-absorbent surfaces, easily cleaned, and the class- rooms are so abundantly lighted with large windows that the finest microscopical work may be carried out without unduly straining the eyesight. The rooms are warmed by hot water, and when necessary lighted with electric light throughout. The dissecting-room, about '75 feet long, is situated at the top of the building, lighted from above, and ventilated by means of electric fans. Its glazed brick walls and its terazzo floor with rounded angles and its spacious cubical area make it peculiarly

TO ARCHITECTS, SURVEYORS, &c.

The Original Patentees and Sole Manufacturers of the MICA VALVE CHIMNEY BREAST VENTILATOR (patented by Comyn Ching & Co. under the name of "Thomas Boyle's Patent") having suffered for some time past by WORTHLESS IMITATIONS being supplied to Builders and others, which are badly fitted with inferior materials, neither Smoke-proof nor Proof against back-draught, are very noisy in action and soon get out of order,

Beg to call the attention of the Profession to the following fact:—

The only Perfect Ventilators have the Patentees' MONOGRAM CAST IN the front, and the only GUARANTEED NOISELESS is Ching's NEW PATENT SILENT Chimney Breast Ventilator with the NAME and MONOGRAM CAST IN.

TRADE MARK.

Any Infringement of the above Patent or Trade Mark Monogram will be subject to an action at law.

CHING'S Patent Mica Valve Chimney Breast Ventilator, or CHING'S New Patent Silent Chimney Breast Ventilator.

TO BE HAD OF ALL IRONMONGERS AND VENTILATING ENGINEERS IN THE UNITED KINGDOM.

healthy. It is furnished with glass and iron tables and every modern appliance. The physiological classroom is a very large and well-lighted apartment, and the pathological and bacteriological laboratories have been constructed with equal care. There is also a large dark room for photographic work.

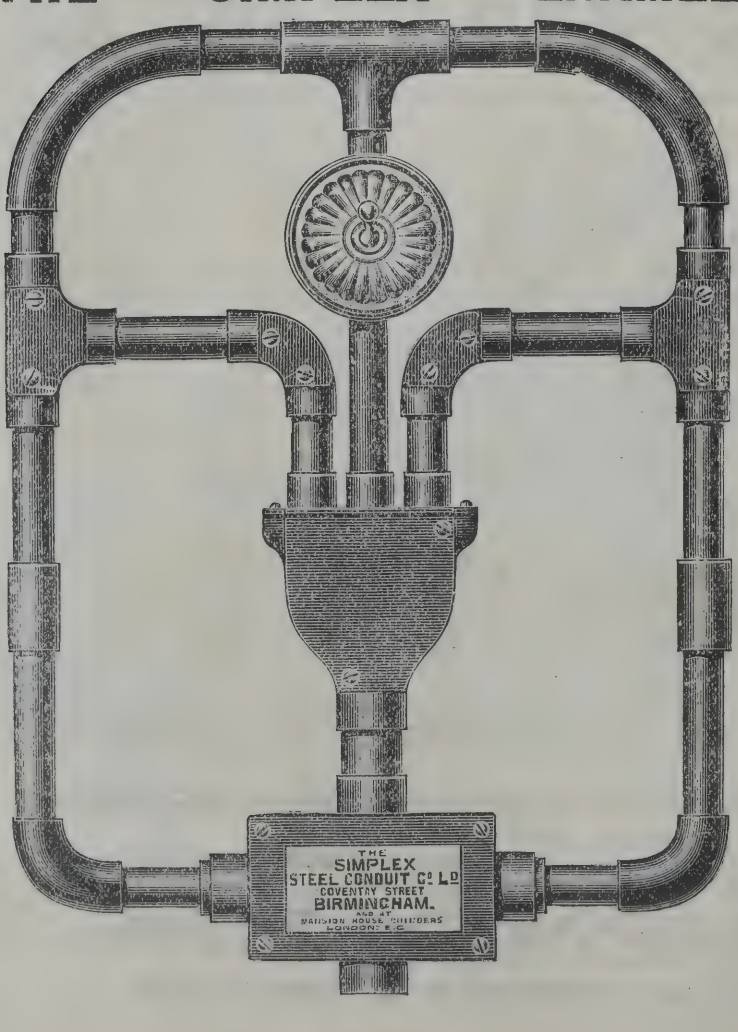
BUILDING AND BUILDERS.

MEMORIAL stones of new Sunday schools at rear of the United Methodist Free church, Washwood Heath, Birmingham, were laid on Saturday last.

THE Wesleyan Methodists of Nelson have decided upon a scheme of extension which includes the erection of three chapels at a cost of 10,000*l.*

SOME scaffolding on which three men were working at a new factory being erected for Messrs. W. D. and H. O. Wills, the tobacco manufacturers, at Bristol, gave way one day last week. Benjamin Beer sustained fatal injuries, and his two companions were badly hurt.

A KURSAAL is to be erected on the Harbour Parade, Ramsgate, in accordance with a scheme approved by the Town Council, and from designs by Mr. T. W. Cutler. On the ground-floor there will be a buffet extending back from the parade a distance of 100 feet. A second-class restaurant, to afford seating accommodation for 300 persons, will adjoin the buffet. Overhead there will be first-class dining or supper-rooms, consisting of a saloon and a number of smaller apartments. An assembly-room, 100 feet by 70 feet, will be situated on the ground-floor to the west of the restaurant. In addition to a theatre occupying the floor above the banqueting-hall, there will be provided a roof-garden in the continental style.



THE Victoria Hall Company, Aston, Birmingham, have decided to increase the accommodation at the hall by building upon the land in the rear, adjoining Witton Road. Plans have been drawn by Mr. A. Edwards, of Bennett's Hill, for the erection of a block of buildings, which, when completed, will be a valuable addition to the present structure. The additions will consist of a large hall, 47 feet by 46 feet, cloak rooms, refreshment room, small dining hall, and suite of Masonic rooms. The new large hall will accommodate about 100 dancers, or an audience of about 400. The total cost of the buildings and furnishing now proposed is estimated at about 3,000*l.*

A WIDELY representative conference in regard to a draft Bill for the national registration of plumbers was held at the Institution of Mechanical Engineers on Friday, under the auspices of the National Association for the promotion of Technical and Secondary Education. Sir Henry Roscoe, the hon. secretary of the Association, presided. A draft Plumbers' Registration Bill was considered by the conference, and was ultimately adopted with certain amendments, but without prejudice to the question as to whether any Bill is desirable or not. Before the conference terminated, the question as to whether such a Bill is desirable or not was, however, discussed, and the following resolution was eventually passed by a large majority:—"That, having regard to the division of view manifested at this meeting in reference to the desirability of a Bill for the national registration of plumbers, no further steps be taken in the prosecution of such a measure."

"YOU would be surprised to hear how superstitious some men employed in the building trade are," said an elderly builder's foreman representative. "For instance, it's considered by some a most unlucky thing to lay the top brick at the north corner of a building. I've known men do all sorts of things to escape this duty. They will undertake some harder work, sham dizziness or even lose half a day's work. To brick up in the recess of a wall a cast horseshoe with a penny tied to it is usually recognised as a sure forerunner of a season when work is plentiful. Another belief, that by substituting a sovereign for the penny a man will never meet with an accident or be out of work, is very often talked about, but I have never heard of a man trying it. All sorts of things are bricked up in walls 'just for fun,' and not because they have any charm or good omen about them. Newspapers, old boots, bottles and such-like things are served in this way, and a favourite way of playing a joke on a 'mate' is for a man to conceal his beer can in the wall, and then build it in."

THE foundation-stones of St. Michael's Church, Belfast, have been laid. The site is a piece of unoccupied ground in Craven Street, off Shankill Road, which was purchased some time ago by the congregation for the sum of 1,450*l.* The cost of the entire structure when completed will be about 3,300*l.* The dimensions of the new church are 104 feet by 74 feet. It will be capable of comfortably accommodating between seven and eight hundred people, while the plans provide for the erection of a gallery, which could seat about 150 more. The style is Gothic, and the material used in the walls is brick, with Dumfries red sandstone dressings. The inside

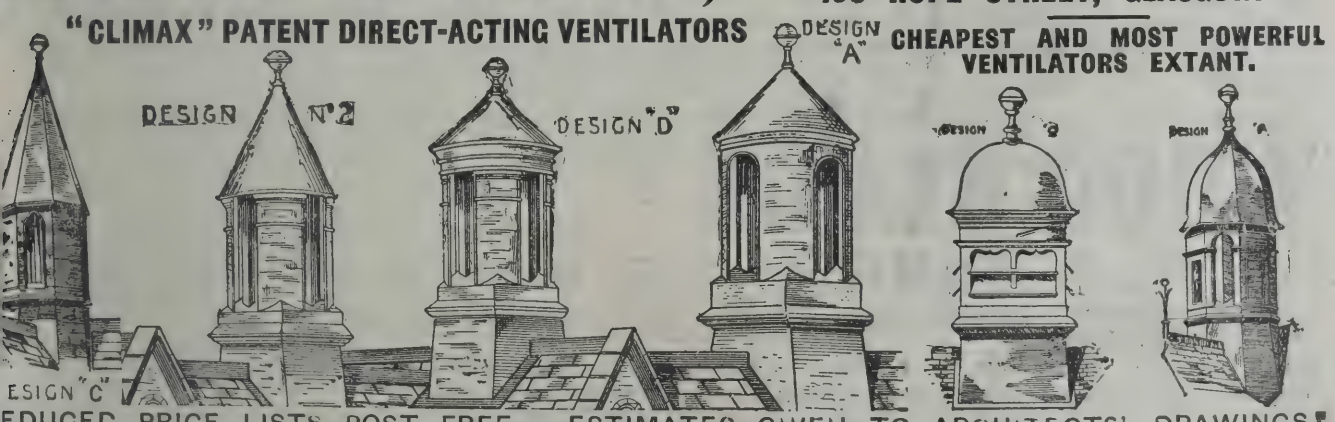
olumns are to be built of white Bath stone, and all the internal oodwork will be pitch pine. The heating and lighting will be arried out in accordance with the most modern improvements. he builder is Mr. James Kidd, and the architect Mr. Samuel . Close.

THE Redditch Urban District Council, having recently pplied to the Local Government Board for sanction to borrow 600*l.* to purchase the old police-station in Evesham Street, edditch, and adapt it for public offices, fire-engine station nd public baths and wash-houses, Mr. G. W. Willcocks, C.E., ocal Government Board inspector, held an inquiry respecting ie application at the Council offices, when it was explained iat it was proposed to provide four hot baths, Council-hamber, fire-engine station, public offices, &c. The county uthorities were erecting a new police-station, and it was con-dered to be a favourable opportunity for acquiring the pro-erty for the purposes mentioned. A description was given of ie intended alterations, for which it was proposed to borrow n additional 250*l.*, making 1,600*l.* The surveyor presented lans, and remarked that owing to the recently-increased price f certain material, the estimates would probably be increased y 75*l.* Evidence was given by several councillors, and the roceedings closed.

AT a Tynwald Court held at Douglas on the 15th inst. the own Council applied for leave to borrow 16,000*l.* to acquire t. Matthew's Old Church and land adjoining, and erect iereon new public market buildings. It was proposed to extend the repayment of the loan over a period of fifty years, ie annual cost representing a rate of 1¼*d.* in the pound. It as stated that the net liability of the borough would then and at 224,070*l.* 6*s.* 3*d.*, the annual payment on which was 020*l.* The whole charge, however, would not fall on the orough rate, as some of the works, including the market, were emunerative. The ratable property in Douglas was about 37,000*l.*, and the borough rate for the current year 2*s.* 3*d.* in ie pound. The application was granted.

THE York City Council, having applied to the Local Government Board for sanction to borrow 2,130*l.* for the urchase of land to carry out street improvements in Davygate nd College Street, Mr. W. O. E. Meade-King, inspector of ie Local Government Board, held an inquiry into the matter i the Old Council Chamber of the Guildhall. The Davygate nprovement was first inquired into, and the Town Clerk xplained that it involved the widening of the street at the end ear St. Sampson's Square. The property required had been purchased, and the work of improvement commenced, for the sum of 700*l.*, part being paid in cash and part by property in exchange. The land required would be about 120 square yards, 77 of which would be used in widening the street. In connection with the College Street improvement, the Counc had purchased 686 square yards from the Ecclesiastical Commissioners for 1,350*l.* and interest from September 29 to the completion of purchase. It is intended to pull down some old property and widen the street, which is a near route from Goodramgate to Lendal Bridge. There was no opposition offered.



THE SUDAN RAILWAY.

A CORRESPONDENT of the *Times* says:—A good deal of comment has been caused by the news that the contract for the bridge which is to carry the new Sudan railway over the river Atbara has been given to an American firm, and it seems to have been assumed in some quarters that a Transatlantic ironmaster had been preferred to a British manufacturer, and that the Egyptian Government had gone out of its way to ignore this country. But the facts are exactly the reverse. The English agents for the Egyptian Government, who had the ordering of the Atbara bridge, gave the first chance to British traders, and would doubtless have given them the sole chance but for the imperative importance of speedy delivery. Of the British ironmasters approached not one could guarantee delivery in the time at which delivery was required. One English firm ran the Americans pretty close as to time; but speed being of paramount importance, and as the Americans could insure it in the greatest measure, there was no choice but to go to them for the work. In contrast to the promptitude with which they have shipped the component parts of the bridge may be placed the fact that the agents of the Egyptian Government had to wait four months for one small bridge of 31 tons ordered in England. Probably the recent engineering dispute was responsible for this. It will be found that the locomotives for the Sudan Railway, or, at all events, the first batch delivered, will come from America. The reason in this case is precisely the same. The desire is to get delivery with all possible despatch, and as America is in a position to guarantee greater speed than England, the Government agents, with every desire to place their orders here, have had no choice but to go to the States for at least that portion of the order which could not wait.

CRAIGMILLAR PARK FREE CHURCH.

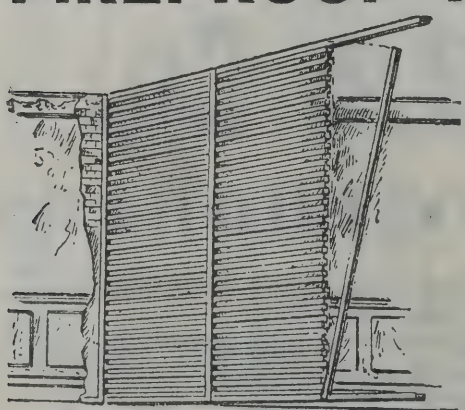
THE foundation-stone of Craigmillar Park Free Church, Edinburgh, which was laid in May last year, is now completed, and was opened on the 8th inst. It is cruciform in plan, consisting of nave, aisles and transepts, and semi-octagonal apse. The principal entrance is under the tower, which communicates by a pointed arch with a spacious vestibule extending the whole width of the nave, giving easy access to all parts of the church. An exit door is also provided through a porch in the south aisle. The aisles are merely used as passages, so that a clear view of the pulpit is obtained from every part of the church. There is a gallery at the west end of the nave over the vestibule. It is intended shortly to introduce an organ, and a chamber has been provided for this purpose. The church is designed in the Late Decorated period of Gothic. The nave is divided into three bays, with stone pillars and richly-moulded stone arches, over which are the clerestory windows, each of three lights with traceried heads. The intersections of the transepts with the nave are spanned by a single arch. The apse is also separated from the nave by a richly-moulded arch springing from impost pillars with moulded bases and caps.

NON-FLAMMABLE WOOD.

THE British Non-Flammable Wood Company, Limited, Army and Navy Mansions, Victoria Street, have sent us on one of their new illustrated booklets. It is well printed and nicely got up generally, and it contains an exhaustive history of the company's non-inflammable wood from the first inception of the idea through its various stages of research and experiment to its present triumphant result in an established and widely-recognised building material of great and increasing importance. We have on two occasions given reports of public experiments to which the prepared wood has been subjected, and we now give a description, which we take from the book in question, of the process of rendering wood non-inflammable as carried out at the company's extensive riverside works, covering an area of about 3½ acres, at Fulham.

"The timber to be treated is stacked on low wheel trollies running on tracks laid from the stacking yard into the treating retorts or cylinders, which are 105 feet in length and 7 feet in diameter. The loaded trucks are then run into the treating cylinder, more or less trucks being employed according to the quantity of timber to be treated, and the door of the cylinde closed. Since it is essential that the cylinders be airtight an capable of sustaining great pressure, this door or lid, whic weighs no less than 7 tons, must be capable of making a perfe airtight joint. This is effected by means of radial bolts special design. The load is now subjected to changes of ten perature and certain manipulation, by which means the volati and fermentable constituents of the wood are withdrawn an the pores of the wood prepared for the reception of the fire proofing ingredients. When the timber is ready, the latter presented to it in the form of a solution of a certain definit strength, such strength varying with the description of woo under treatment. Hydraulic pressure is next applied until th wood is thoroughly saturated. The cylinder is then opene and the load withdrawn, which, if the cylinder be full, wi consist of 20,000 feet.

"The wood now thoroughly saturated, and consequentl more than double its original weight, is restacked and run int the drying kiln, which is a large room fitted with heatin apparatus and air fans to circulate warm currents of air, an condensing apparatus to condense the vapour arising from th wood. In about thirty days a load of wood of average thick ness should be dry, that is, the aqueous portion of the solutio has been drawn off, leaving the fireproofing ingredients closel incorporated with the cellulose in the pores of the wood. Th wood is now ready for delivery, and owing to the fact that th volatile and fermentable constituents have been driven off an their place filled with antiseptic material, no rot can take plac Besides, as the wood has been equably dried, the possibility after-warping is avoided, and since the interstices of the woo are packed with material no after-shrinkage is possible.



"One great advantage of this process is that it is immateria for how long or short a time the wood has been felled or sawr as within one month it is rendered non-flammable, seasone and dried.

"There are certain peculiarities in nearly all descriptions wood, and as no engineer, however skilful, will guarantee t make a large steel or iron casting without internal air bubble so in wood certain small streaks sometimes appear to have th property of resisting impregnation, although the solution ha penetrated all round and beyond them. This, though interestin from a technical point of view, does not affect the general nor inflammability of the wood so treated.

"The chemicals employed for effecting the fireproofing ar antiseptic, odourless and harmless, and do not injure the wood

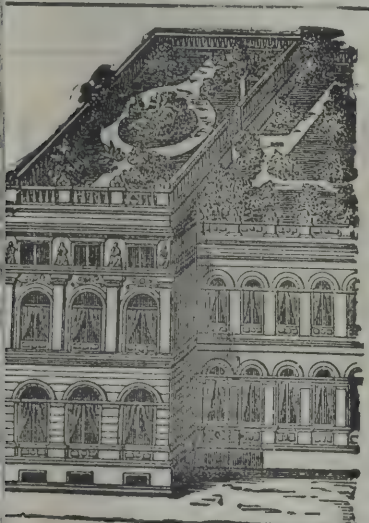
NEW CATALOGUE.

om Messrs. Nicholls & Clarke, of Shoreditch, we have eived a copy of their new catalogue, and a beautiful work is. Our readers, no doubt, remember that we gave some ie ago a descriptive account of a stained-glass window which d been designed and executed by Messrs. Nicholls & Clarke. The memory of this artistic effort gave assurance that thing which the firm might produce would be all which e, skill and a disregard of expense could make it, and thus fully expected that an examination of the new catalogue uld show it to be a work of the highest character. It is mirably printed on thick hot-pressed paper, and bound in h a way that the book will lie open at any page—a great nvenience, and one not often studied. Then the covers are ut and handsomely gilt-lettered, so that the volume would m a useful and durable work of reference for architects and veyors. There is hardly an item whose character and form not demonstrated by an engraving. Moreover, these gravings are well cut, and "come out," as is the technical m, beautifully. Altogether, if simply regarded as an effort the printers' and the bookbinders' art, the catalogue of ssrs. Nicholls & Clarke would be hard to beat.

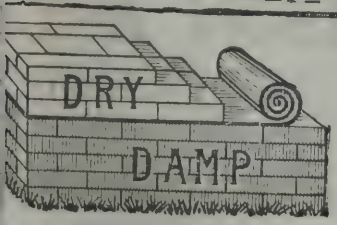
Its contents are equally deserving of praise, for not only are se conveniently arranged for reference but in every instance fullest details are given. Of this a striking example is nd on page 184, where, under the heading "Notes on mps," is given some valuable information as to the con-uction, management and power required for pumps of all ds—information which would render the catalogue useful as ork of reference for surveyors and others interested in such tters. This is but one instance out of many.

Another important feature in this work is the fact that rein are illustrated and described not only the specialties of ssrs. Nicholls & Clarke themselves but those of other well-own firms. Thus architects and others can see all the best ods in each department and decide on the most suitable icle to be specified, without the loss of time involved in nsulting a number of catalogues.

We have spoken of the excellent arrangement of the con-ts of the work. This is the more noticeable from the number departments which are dealt with and the great variety of ods set forth. The catalogue is divided into sections—some enty-six in number—while a copious general index renders it sible to at once refer to any article however small which is ntained in the work. Some idea of the size and comprehen-siveness of this catalogue may be obtained when it is mentioned that it consists of 408 pages, of which no less than sixteen are devoted to the index.



A further and important merit of the work is that it contains the model by-laws of the Local Government Board for the use of sanitary authorities, the by-laws of the London County Council, the regulations of all the London water companies, as well as those of the most important provincial corporations.



Altogether the catalogue of Messrs. Nicholls & Clarke is a work which should be in the possession of architects, surveyors, builders and everyone engaged or interested in constructional work of any kind.

WORKMEN'S COMPENSATION ACT AND ALTERATIONS.

The decision in the case Hoddinott *v.* Newton, Chambers & Co., Limited, which was given in the Court of Appeal on Saturday, reveals that the Workmen's Compensation Act is inapplicable to accidents caused during the alterations of buildings. According to the *Times* report, the claimant was the widow of a deceased workman, who was at the time of his death in the employment of the appellants, who were builders. It appeared that a stable had been built for the London General Omnibus Company about six months before the time of the accident, and was occupied by the company. After it was occupied the company's engineer considered that it was requisite to strengthen the structure by putting in iron stays to prevent vibration. The appellants were employed by the company to put in the stays fastening together the columns and girders of the stable. For that purpose three planks were placed on two trestles about 8 feet from the ground, and the workmen stood on the planks while at work. These trestles and planks were removed each night on account of the horses in the stable. At the time of the accident the deceased man was standing on the planks engaged in assisting to raise up one of the iron stays, when he overbalanced himself and fell off and was killed. Two questions were raised—(1) whether the building was over 30 feet in height, and (2) whether it was being "constructed or repaired by means of a scaffolding" within section 7, subsection 1, of the Workmen's Compensation Act, 1897. The height from the ground to the parapet of the building was 28 feet, and from the ground to the top of the roof the height was 36 feet. The contention on

PATENT
VULCANITE ROOFING.

Since the introduction of the patent Vulcanite Roofing into this country it has been adopted by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospitals, Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summer than under any other roof. When properly laid repairs are never required, and all roofs are guaranteed. The roof-surface can be used as a garden, or for any other purpose. The cost of construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGES, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to 40 inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower and quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and for SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 superficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires no annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.

THE PATENT VULCANITE ROOFING & ASPHALTE CO., LTD.,
OLD FORD, BOW, LONDON, E.

Inquiries from the North of England, Scotland, and Ireland, please address to Laganvale, Belfast.
Agents wanted in all districts where not yet represented for laying of Vulcanite Roofs and Sale of Sheet Asphalte.

LX. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered. Price 12s. 6d. Office: Imperial Buildings, Ludgate Circus, E.C.

behalf of the employers was that, inasmuch as nothing was being done to the roof, the height of the building must be taken, as in section 5 of the London Building Act, 1894 (57 and 58 Vict. c. ccxiii.), from the ground to the top of the parapet. It was also contended on their behalf that the building, if over 30 feet in height, was not being "constructed or repaired by means of a scaffolding," the work consisting of alterations to the building, and not repairs, and the arrangement of planks and trestles not being a "scaffolding." The County Court judge decided both the questions in favour of the claimant, and awarded her 24*l.* 14*s.* as compensation. It appeared that the claimant had brought an action under the Employers' Liability Act, 1880, to recover damages, alleging that the planks and trestles were defective, but the County Court judge gave judgment for the employers in this action, and then, upon the application of the claimant, the judge proceeded, under section 1, subsection 4, of the Act of 1897, to settle the question of compensation under that Act. The judge, as above stated, awarded the claimant 24*l.* 14*s.* as compensation, but deducted from this sum the costs of the witnesses called by the employers in the action under the Employers' Liability Act, 1880. The employers appealed.

Mr. R. M. Bray, Q.C., and Mr. G. Spencer Bower, for the appellants, contended that the work being done was not repairing work. It was alteration work. Section 7, subsection 1, used the words "constructed and repaired" with reference to a building; the word "altered" was not used; whereas in the definition of "undertakers" in subsection 2 the words used in connection with engineering work were "construction, alteration or repair." Nor was the building being "constructed." Even, however, if it was being constructed or repaired, it was not being constructed or repaired by means of a "scaffolding." This arrangement of planks and trestles did not constitute a scaffolding; it was a mere temporary structure, and it was inside a completed building. Secondly, this building was not over 30 feet in height within the meaning of section 7, subsection 1, of the Act. The height from the ground to the parapet was that to be looked at. This was shown by section 5 of the London Building Act, 1894. And even if the building was 30 feet high the scaffolding was not 30 feet high. The section must be read as making the Act apply to a building being repaired at a height of 30 feet by means of a scaffolding.

Mr. Ruegg, Q.C., and Mr. Moyses, for the respondents, argued that this was a case of the construction of a building. The building had never been properly constructed before, and it was being perfected. If it was not construction it was repair. And it was by means of a scaffolding. The word "scaffolding" was not used in the Act in any technical sense, but in its colloquial meaning. It was not necessary for the scaffolding to be 30 feet high. The Act might be illogical, but the words were clear.

The Court allowed the appeal.

Lord Justice A. L. Smith said that in this case an action had been brought under the Employers' Liability Act. The County Court judge held that the case did not come within the Employers' Liability Act, and thereupon an application was made to frame a claim under the Workmen's Compensation Act. The accident happened in a building which had been erected by the London General Omnibus Company for stables. The first question was whether, for the purpose of satisfying the requirements of section 7, subsection 1, of the Workmen's Compensation Act, the height of a building was to be measured to the top of the upright walls or to the top of the roof. He would leave the question as to the proper method of measuring the height of underground buildings. With regard to this case, it was only necessary to say that the building was shown to be more than 30 feet in height up to the top of the roof; and, in his opinion, the applicant had thereby made out that the building exceeded 30 feet in height within the meaning of the Act. The next question was whether it was a building which was being either constructed or repaired by means of scaffolding. With regard to the question whether the planks and trestles constituted a scaffolding the County Court judge had found that they did; and, in his opinion, it could not be said that there was no evidence of a scaffolding having been used. Speaking for himself, he thought it was immaterial whether that which was alleged to be a scaffolding was inside or outside a building. Neither did he think that the scaffolding need be 30 feet high. The Act did not say so. The words of section 7, subsection 1, were "Any building which exceeds 30 feet in height, and is either being constructed or repaired by means of a scaffolding." It did not say by means of a scaffolding 30 feet in height. He passed on to the question whether the deceased man was employed by the undertakers on a building which was being either constructed or repaired by means of a scaffolding. "Undertakers" were defined in subsection 2 of section 7, and were stated to be, in the case of a building, the persons undertaking the construction, repair or demolition. Here the building was

already completed and was in actual use. After it was completed something which was not in the original design was found to be necessary in order to strengthen it. Thereupon ironmasters were called in to put in girders for this purpose. Could it be said that the ironmasters were constructing the building? No, it had been already constructed. In his opinion, it was impossible to say that this was employment by the ironmasters on a building which was being constructed. In the case of an engineering work "undertakers" were defined to be the persons undertaking the construction, alteration, or repair. But the Legislature, when they came to the case of a building, left out the word "alteration." Then was this a case of repairing a building? In his opinion it was not. Nothing was out of repair; the building was a new building, which wanted something additional in order to strengthen the roof. Putting in that something additional was not repairing. He thought that the claim failed on the ground that this was not a case of employment on a building which was being constructed or repaired. The appeal must, therefore, be allowed.

Lord Justice Collins was of the same opinion. He thought it was necessary to look at the provisions of the Act as a whole to see what the Legislature meant. The Act applied to employment by the undertakers as therein defined on any building which exceeded 30 feet in height, and was being constructed or repaired by means of a scaffolding, or being demolished. He thought that scaffolding must have some relation to the height of the building. It must be interpreted by reference to the nature of the work for which the Legislature contemplated it was to be used—*i.e.* in the construction or repair of a building exceeding 30 feet in height by an undertaker, who was defined to be the person undertaking the construction, repair, or demolition. This definition threw some light upon the question, what sort of operation the Legislature was contemplating. It was the construction, repair, or demolition of a building which would *prima facie* suggest the building as a whole. And the operation to which scaffolding was contemplated as an essential would seem therefore to be *prima facie* the work of constructing or repairing such a building as a whole, an operation to which a scaffolding was essential. It was not necessary, and it would be impossible to define what was the exact legal meaning of scaffolding as used in this connection, nor was it necessary to decide whether something short of construction or repair of a building over 30 feet high as a whole, carried out by means of a scaffolding in the full sense of the term, such as might be used for dealing with a building over 30 feet high, might not be within the Act. But though definition was difficult or impossible, it was possible to say as to certain cases that they fell within or without the Act. It seemed to him that the present case could not be brought within the Act without straining the particular words at the expense of the general intention. It was impossible to suppose that the Legislature fixed 30 feet as an arbitrary line having no relation to the actual risk provided against, so that, when a building had once reached 30 feet high, any operation which could be called construction or repair of any part of the building inside or out, however near the ground, where the workman had to stand on an arrangement which might be termed scaffolding in order to reach it, would be within the Act, and give him a remedy if he fell. Such an interpretation would give no reasonable ground for the introduction of 30 feet at all. It never could have been meant to cover the case of a man employed to put up a rod to hang pictures on in a drawing-room, though he supported himself on a platform which could be called a scaffolding, in order to do it. It was obvious that the height of the house could have no bearing whatever on the risk of such an operation. It might be said that was not a case of repair, but no more was the case before the court. But the same observation would apply to whitewashing a ceiling. He came to the conclusion that the case did not come within any view which could possibly be taken of the intention of the Legislature.

Lord Justice Romer delivered judgment to the same effect.

PARIS EXHIBITION, 1900.

It has been the custom, on the occasion of every recent International Exhibition held in France, to pass a temporary Act, giving protection to patents, designs and trade-marks, in addition to the Act of May 23, 1868, which is quoted in the French Regulations of the Paris Exhibition of 1900. In view, however, of a recent decision of the French Court of Appeal, which has attracted much attention, the French Government are taking special steps to protect exhibitors in 1900. The Royal Commission for the Paris Exhibition have been officially informed by the Consul General of France that a Bill will shortly be laid before the French Chamber, in which certain clauses referring to the invalidation of patents are suppressed. The Act of 1868 will be re-enacted on the present

occasion with some amendments. It will give the owner of a design the rights conferred by patent from the date of admission to three months after the close of the Exhibition without prejudice to any patent or registration which he may effect before the expiry of that period. This gives a longer protection than is afforded in similar cases in the United Kingdom by British law, which specifies that application for the registration of the design must be made before or within six months from the date of the opening of the Exhibition. Her Majesty, by an Order in Council dated February 2, 1899, has declared that the provisions of sections 39 and 57 of the Patents, Designs and Trade Marks Act of 1883 shall apply to the Paris Exhibition of 1900. This relieves exhibitors from the conditions specified in the said sections of giving notice of their intention to exhibit. The new French Act, it is believed, will give British subjects greater protection than the ordinary British law affords to French subjects; and this, coupled with the fact that French judicial decisions have no effect as binding precedents, should allay any fears which British exhibitors may entertain with regard to exhibiting at the Paris Exhibition of 1900.

MEASUREMENT OF LATHWOOD.

THE Board of Trade have received information (through the Foreign Office) from Her Majesty's Consul at Riga that, in consequence of the frequent litigation which has lately attended the shipping of lathwood from that port, a meeting of Riga exporters was held on the 3rd inst. for the purpose of discussing a scheme designed to check the claims for short measurement which are continually being sent in by English buyers. A resolution was adopted by all the firms represented at the discussion embodying the following reglations:—"(1) A measurer will be appointed, whose duty it will be to control the measurement of the lathwood to be shipped, to see that the said measurement is correct and to hold himself responsible to the shipper for correct shipment; (2) the measurer will issue a certificate for each parcel of lathwood shipped, stating the exact measure in fathoms, and this certificate will be attested by the British Consul; (3) the exporters bind themselves to buy only from those dealers who allow the shipments to be made under the control and certificate of the sworn measurer; (4) the exporters bind themselves to sell lathwood to Great Britain only on condition that the buyers accept Riga measurement; (5) the exporters bind themselves not to make any shipment of lathwood save under the control of the sworn measurer and the attestation of the British Consul."

LONDON GOVERNMENT BILL AND THE BUILDING ACTS.

THE works committee of the London School Board have considered the London Government Bill "to make better provision for Local Government in London." The following is clause 6 of the Bill:—

"The committee of the Privy Council hereinafter mentioned shall make a provisional order determining which of the powers under the London Building Act, 1894, or any amending Act, other than the powers mentioned in Part 1 of the second schedule to this Act, are to be exercised by the London County Council and the borough councils respectively, and the conditions under which they are to be exercised, and may embody in the order such modifications of the London Building Act, 1894, and such provisions for the protection of existing interests as may appear expedient for giving effect to the determination."

The works committee, having considered the matter, now recommend that the following petition be presented to the House of Commons:—

"To the Honourable the Commons of the United Kingdom of Great Britain and Ireland in Parliament assembled.

"The humble petition of the School Board for London under their common seal.

"Sheweth—

"1. That a Bill has been introduced and is now pending in your Honourable House intituled 'A Bill to make better provision for Local Government in London.'

"2. That your petitioners are a Corporation constituted under the Elementary Education Act, 1870, and as such Corporation are the public body required under the said Act, and the various amending Acts affecting the same, to provide school accommodation and make educational provision for the whole of the metropolitan area.

"3. That the metropolitan area is for the purposes of the Elementary Education Acts parcelled out into several divisions, and these divisions are for the said purposes subdivided into smaller divisions, and the whole of such area coincides with the area of the administrative county of London.

"4. That your petitioners are required to provide in every such division, school accommodation sufficient for the wants of each of such divisions and subdivisions, and where it is found that there is insufficient school accommodation in a division for the number of children who are subject to the Elementary Education Acts, your petitioners, after the selection of sites for the building of schools and for enlargement of existing schools, prepare and submit plans to the Education Department of the Privy Council for their approval.

"That the plans so prepared of schools to be erected on land purchased by the Board since the passing of the London Building Act, 1894, are subject to the provisions of the London Building Acts, and the schools are built in conformity with such provisions.

"That by Clause 6 of the said Bill it is proposed that the committee of the Privy Council hereinafter mentioned shall make a provisional order determining which of the powers under the London Building Act, 1894, or any amending Act, other than the powers mentioned in Part I of the second schedule to this Act, are to be exercised by the London County Council and the borough councils respectively, and the conditions under which they are to be exercised, and may embody in the order such modifications of the London Building Act, 1894, and such provisions for the protection of existing interests as may appear expedient for giving effect to the determination.

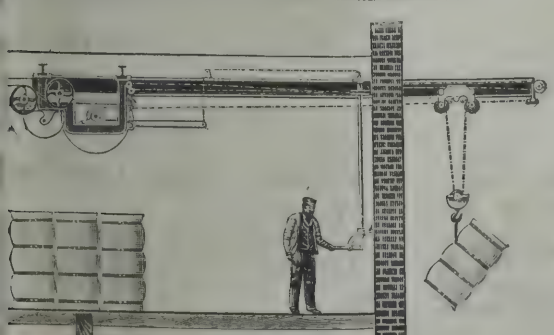
"That it is also proposed by the said Bill to divide the administrative county of London into fifteen metropolitan boroughs, and if the Bill pass into law as it now stands the powers and provisions which have hitherto been in force under one authority may be divided and varied by each of the metropolitan boroughs and different building provisions be made applicable in each borough. That your petitioners are subject to the building rules of the Education Department, and the power to make modifications in the London Building Acts proposed to be conferred on the new authorities may in some cases be in conflict with those laid down by the Education Department.

"That in some instances schools are placed upon sites standing in two parishes, which may hereafter stand on sites in two adjoining metropolitan boroughs, and the buildings forming part of the same school may, under the powers proposed to be conferred on these boroughs, be subject to provisions different from and conflicting with each other.

"That your petitioners are of opinion that great advantages have hitherto been derived from the uniform administration of the London Building Acts under one central authority, and the proposed devolution of powers under these Acts to the various metropolitan boroughs would, your petitioners submit, lead to difficulties in carrying on the work of the Board.

"Your petitioners submit that the powers and provisions of the London Building Acts should be retained under one authority, and that no power should be vested in the metropolitan boroughs to vary the powers and provisions of the said Acts in obedience to the views of the numerous authorities to be created under the Bill, and that the proposed powers will prejudicially affect the rights, property and interests of your petitioners, and your petitioners object to the same.

"Your petitioners therefore humbly pray that the said Bill may not be allowed to pass into law as it now stands, and that the provision relating to the transfer or modification of any power now possessed by the London County Council under the London Building Act, 1894, or any amending Acts shall be struck out of the Bill, or that such other relief may be given to your petitioners in the premises as to your Honourable House shall seem meet."



THE PURIFICATION OF PUBLIC WATER SUPPLIES.

AT a meeting of the Civil and Mechanical Engineers' Society, held on March 16, a paper on the "Purification of Public Water Supplies" was read by Mr. W. N. Twelvetrees, M.I.M.E., M.S.I., and was illustrated by a large number of diagrams, some of which were exhibited by permission of the Institution of Mechanical Engineers and of Mr. P. H. Palmer, borough engineer of Hastings.

Before proceeding to describe in detail the construction of mechanical and other filters, and of plant in which physical and chemical agencies are employed for water purification, Mr. Twelvetrees directed attention to the physical characteristics of water derived from various sources, and mentioned the problems always presented when river water is used for the supply of waterworks. Filtering media of various kinds were next considered, and the conclusions arrived at after exhaustive tests by Dr. Sims-Woodhead, Dr. Cartwright Wood, Dr. Netter of Paris, and others, were quoted. The result of the investigations in question bears out the statement that in a general way the public safety depends largely upon the watchful care of water engineers and of other scientific officials,

and in a lesser degree upon the intrinsic merits of any given filtering medium.

After dealing with the question of natural and artificial purification, by percolation and by deposition, the author demonstrated by the aid of sectional drawings the actual nature of the process taking place in sand filtration beds. Sand in itself presents no special recommendation as a filtrant. The efficiency of a sand filter does not become established until a gelatinous layer, composed of mud, algæ and micro-organisms, has been formed upon the surface. Incidental reference was made to Hunter's sand-washer, the construction and working of which was made clear by a series of diagrams illustrating the application of the apparatus in the Leicester Corporation Waterworks at Swithland. Another type of sand-washer, invented by Mr. A. T. Walker, water engineer to the Reading Corporation Waterworks, was also described.

Leaving ordinary sand filtration, Mr. Twelvetrees proceeded to discuss some modified methods which have been adopted with great success. One of these is known as the Morison-Jewell process, of which the distinctive feature consists in the substitution of a clean film of gelatinous aluminium hydrate for the casually accumulated layer constituting the chief purifying medium in ordinary filter-beds. Another modified mode of sand filtration is one in which polarite, alone or mixed with sand, takes the place of one of the strata of sand. Polarite is the name given to a specially prepared and porous form of magnetic oxide of iron. Water passes freely through as well as around the granules of this substance, within the pores of which polarised oxygen is contained, and which, upon contact with suspended or dissolved substances, produces oxidation. This action is not carried on at the expense of the material itself; and, further, polarite being absolutely rustless, is practically everlasting. Fresh supplies of oxygen are of course necessary, and periodical washing is also required. Some interesting diagrams were shown of polarite filters as used at the Hastings Corporation Waterworks, the Reading Corporation Waterworks, and an arrangement of a polarite filter for purifying rain water was exhibited.

Methods of purification for hot and cold climates, where sand filtration is often impracticable, were next discussed and illustrated. Many forms of apparatus coming under this category show considerable mechanical ingenuity, and installations upon a large scale are noteworthy for the magnitude of their output as compared with the limited space required. Amongst filters of this kind may be specially mentioned the "Riddell," the "Torrent," the "Howatson," and the "Wilson" filters. These have all been applied for public purposes, and in installations capable of dealing with from 1,500,000 to 2,600,000 gallons of water per twenty-four hours. Various ingenious contrivances for cleansing are generally used in addition to reverse currents of water. The Riddell filter has an arrangement of radial arms, which are moved up and down as well as in a rotary manner by hydraulic power. In the Torrent filter compressed air is employed, and in the Wilson apparatus a very ingenious automatic flushing system is adopted.

Mr. Twelvetrees next drew attention to the example of waterworks filtration by the Pasteur method, as used at Darjeeling. The output is about 250,000 gallons daily, and as the Pasteur filtration employs the only known absolutely germ-proof medium, the installation in question may be regarded as unique. Another mode of water purification is that patented by Anderson in 1889, where water is agitated in revolving drums containing fragments of metallic iron. Some of the iron is dissolved, and as the water passes from the apparatus to settling-tanks it is aërated. Oxide of iron thus formed carried down impurities by deposition.

Sterilisation by heat at a temperature of 240 deg. Fahr. affords perfect immunity from pathogenic bacteria, and an apparatus known as the Vaillard-Desmaroux heat steriliser was described and illustrated. This form of appliance has been adopted for the water supplies of towns in Russia and in Brazil. It should always be borne in mind, however, that the extinction of germs and spores is one matter, and that the removal or oxidation of poison in solution is another and not unimportant problem.

Water softening employed for the purification of public water supplies was illustrated by a set of drawings and photographs of the Ashby-de-la-Zouch Waterworks, where the Archbutt-Deeley process is used with great success. Mr. Twelvetrees, in conclusion, emphasised the desirability of regarding efficiency as the first consideration in every case, and expressed the hope that the line of defence established by water engineers in the interests of public safety might always be furnished with weapons of the most modern and scientific kind.

Mr. Baines Dadley, president, in opening the discussion, remarked that the subject before the meeting was one of great public interest, especially at the present time, when the future water supplies of the Metropolis were receiving so much attention. It was a matter of surprise to him that the London water companies had allowed provincial authorities to take the

THE PROBLEM SOLVED.

nitiative in respect of some of the improved methods of purification, to which attention had been directed by the author. A discussion followed, and the author was thanked for his paper.

THE CENTRAL LONDON RAILWAY.

THE Central London Railway, which, at any rate so far as the ine itself is concerned, is now rapidly approaching completion, ›ids fair, says the *Daily News*, to be one of the finest bits of ailway work in the world. Indeed, in its way it will be found ar ahead of anything yet attempted. Sir Richard Farrant, vho is chairman of the company actually making the railway, s immensely proud of it, and ascribes its superiority to their aving plenty of money. Undoubtedly that has been a most mportant factor in the business. One can see evidences of it n all hands. But though plenty of money is an extremely mportant matter, it needs some good heads to make the best se of it, and the enterprise seems to have had this too. As nost people know the line runs from the Bank to Shepherd's Bush, and at each end a very remarkable piece of work is going on.

At Shepherd's Bush the company have got a terminal depôt overing 19 acres of ground, and they are getting rapidly owards completion with what will pretty certainly be the finest lectrical installation in the world. Americans who have been o see what is going on are fain to admit that they have nothing o touch it, and that it must be admitted is an admission not asily wrung from Brother Jonathan. The electric sprite to be conjured up here will have to be versatile as well as tremendously powerful. It will not only drive all the trains and light all the carriages and stations, but it will work innumerable passenger lifts and run all sorts of machines in the repairing shops they are setting up at the depôt—lathes and boring tools, drilling machines, saws, presses and so on. The steam engines and electrical machines are beginning to arrive now and are getting into the huge buildings. They have got a boiler-house 150 feet long by 85 feet wide, and their coal-scuttles will hold somewhere about 900 tons of coal. Fortunately these coal-scuttles have not to be carried to the coal, the coal is carried to them. They are huge bunkers fixed high up overhead. The coal will be brought into the depôt from the North-Western or the Great Western, and will be shot into a sort of hopper outside the building. From thence it passes down into a kind of underground culvert, where it will be scooped up by an endless series of dredging buckets, or something like them, carried up aloft and then pitched into the bunkers from each of which a shoot runs down to each of the furnaces under the sixteen multitubular boilers. Down these shoots the coal will be mechanically driven, and when it has been mechanically stoked into the furnaces, the ashes dropping out underneath will be scraped out by the ubiquitous mechanism, passed down a channel and dropped into a railway truck down in the shades below, ready to be hauled away, the whole business of supply, stoking and clearing going on almost without human intervention.

At the back of the boiler-house stand two stately and innocent-looking chimneys—new, clean and respectable as two church steeples. They stand 200 feet high, and nobody to look at them would ever believe them capable of rolling out dense volumes of pestilential smoke to smother the neighbourhood. These tall twins have tremendous sucking power. Either of them could by itself do the whole work of the line, but it seems to have been the rule throughout this model railway to duplicate everything, and to spare no expense in guarding against the possibility of a breakdown anywhere. Near the foot of the chimneys is a vast sunken water-tank, holding about a day's supply of water, so that if anything should go wrong with the mains there will be a reserve. The cold water before it reaches the boilers will pass through what are known as Green's economisers—receptacles standing in the full rush of the fiery blast that roars along from the furnaces to the chimneystacks. The waste product of the furnaces, so to speak, is thus used to give a preliminary heating to the water, which reaches the boilers at very nearly boiling-point. This of course saves coal.

Adjoining this boiler-house is the power-house, a vast building 200 feet long and 85 feet wide. The pipes will come from the boiler-house through into a basement 12 feet high. This basement is at present all open, and they have planted in it huge masses of solid concrete 25 feet by 32 feet, upon which the engines and dynamos will rest as secure as though built on solid rock. These concrete foundations are finished, and they are putting in six Allis engines, from Milwaukee, of 1,300 horse-power each. They are in direct connection with three phase alternators. These six engines run six dynamos generating current at 5,000 volts pressure. This formidable current is transmitted from the power-house at Shepherd's Bush to four sub-stations at Notting Hill Gate, Marble Arch, Davies Street and Post Office, where

this high-pressure alternating current is transformed to direct current at 500 volts pressure, the usual thing for working a railway. By this arrangement a very efficient working power is provided throughout the double line, which is 6½ miles from end to end. Besides these great buildings for boilers and engines and dynamos, a striking feature of this depôt are the carriage sheds and carriage repairing sheds, which cover three acres. The carriage sheds can take in twelve complete trains of seven carriages, each train capable of carrying 350 passengers, and the repairing sheds can take in nearly as many more. There will, by the way, be only two classes on this new railway. They will be first and second. There will be no third. The fares are not yet arranged.

The tunnels are now complete throughout, and some of the permanent way is laid. Nothing finer of the kind has ever yet been done, and probably nothing equal to it. Massive oak sleepers are laid longitudinally on a concrete bed at the bottom of the circular iron tube forming each tunnel. On these heavy baulks of oak a 100-lb. rail is laid, and the whole bed of the line then filled in with concrete. The trains ought to run as smooth as though they were on solid rock. The stations are lined with beautiful white tiles, and are, of course, to be lighted with electricity. They will be reached from above both by spiral staircases and by electric lifts, travelling up and down at the rate of 200 feet a minute. The fall and rise of these lifts will average 67 feet for all stations. They have had one under test for over two months, and the thing has been demonstrated to be absolutely reliable and safe. The mere fact of the electric current failing from any cause stops the lift automatically. Under no possible circumstances can the cars escape control and drop without arrest. At the Bank and Post Office stations there will be no less than five lifts, each capable of carrying 100 people. At some stations the shafts in which they travel up and down are 30 feet in diameter, and in these there are three lifts. At some of the other stations there are two lifts in a shaft of 23 feet, each lift holding about sixty people. These ingenious flying rooms are being set up by the Sprague Elevator Company, of New York.

The stations most advanced are those at Holland Park, Notting Hill Gate and Tottenham Court Road, but most of the others are now beginning, or will soon begin, to set up their buildings above ground. The most backward part of the undertaking is the Bank Station, where the contractors have been terribly hampered by the necessity of so conducting the work as not to interrupt the street traffic overhead during the day. They have to open the roadway, work at high pressure through the night, and cover it all in again ready for the surging tide of vehicles in the morning. This is one of the most difficult and complicated engineering feats of the kind ever yet attempted; indeed, nothing quite like it has ever been done, for the simple reason that nowhere on the face of the earth is there just such a centre of traffic as that between the Bank and the Mansion House.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

Applications for Patents.

5539. Haydon Parker, for "Mechanism for controlling and aiding the closing of doors, flaps and windows."

5560. Wesley John Butler, for "Improvements in windows and their casements."

5566. Alexander Heinterberger, for "Improved method and apparatus for ventilating rooms and other enclosed spaces."

5673. Frederic Nussbaumer, for "Improvements in automatic catch devices for retaining swinging of French windows in their open position."

5694. Johannes Stumpf, for "Improvements in windows."

To Inventors.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. Rayner & Co., Patent Agents, 37 Chancery Lane, London, W.C.

The church of St. Matthias, Tulse Hill, which was consecrated on Saturday last, is of brick, is built in the Early English style, and will seat 800 people. It has cost about 12,000*l.*

The Architect.

THE WEEK.

ST week we mentioned the competition for a Jubilee rch in Vienna, and said, "This is the first time, we eve, an English architect has officiated as a judge in a tinental competition." It should have been noted that he end of 1884 there was another instance of an inter- ional jury with an English representative. The com- tion for the new Exchange in Amsterdam was opened all architects. The jury consisted of Herr CUYPERS, esenting Holland; Professor RASCHDORF, Germany; on SCHMIDT, Austria; M. PAUL SEDILLE, France; R. PHENÈ SPIERS, England; and M. VAN YSENDYCK, gium. There were about sixty competitors. Five gns were selected for a second competition, and nately the first prize of 10,000 gulden was awarded to a nch architect, M. CORDONNIER, of Lille. The second e of 6,000 gulden was gained by M. GROLL, of London Vienna; the third prize of 5,000 gulden by Herr LKMAAR, of Berlin, and the fourth prize of 4,000 gulden MM. SANDERS & BERLAGE, of Amsterdam; the winner he fifth prize of 3,000 gulden was not announced at the . Holland was not as victorious as was anticipated, although there were five or six English designs, not was premiated.

THE jury appointed in the competition between houses ted during 1898 in Paris have selected out of the ber of buildings brought under their notice six houses. tors to Paris in the present season may be glad to know designations. They are No. 18 Rue Croix des Petits mps, No. 24 Rue du Roi de Sicile, No. 204 Rue de nelle, No. 38 Avenue d'Antin, No. 87 Boulevard de la tte and No. 16 Rue la Fontaine. The respective itects are MM. BREFFENDILLE, GEORGES DEBRIE, QUET, BUNEL & DUPUIS, ROBIER & GUIMARD. owners and contractors will receive rewards. There be gold medals for the architects, bronze medals for contractors, and a reduction of rates for the owners. jury consisted of M. BOUVARD, the municipal engineer Paris, five members of the Municipal Council, the rintending architect of the city, with MM. GUADET BONMER, architects, who were nominated by the com- ors. The competition is an incentive to design, and be continued every year.

THE revelations of the pictures which are to appear in orthcoming exhibition of the Royal Academy do not promise of an exhilarating spectacle. Many of the s who usually endeavour to please seem to be ving themselves for 1900 and possibly for the Paris bition. About the over abundance of portraits there doubt, so the visitors as usual will be able to test their nce. Not one work of marked originality has come e the studio hunters. Those who have had experience cademy exhibitions could easily prepare a description at will be seen in the galleries. The commonplace is ned to prevail. If Mr. ALMA-TADEMA'S scene in the s of Caracalla can be completed to the satisfaction of stidious artist it will offer compensation for some dis- ntments, for the combination of architecture, marble ation and figures which such a work presents is ly suited to his powers. The Thermæ could accom- te about 1,600 bathers, and were supposed to be able. But bathing was not the only object of the . They were the fashionable lounging places of Rome, in them "pleasure was raised to the rank of an tion and organised on the plan of an architect."

IE danger of interfering with economic laws has been lified in a remarkable way in the granite trade of ca. It was the custom to operate on the material in at the quarries, and in that way economy and con- ice were secured. The labour organisations cared about the public advantage, and they were able to a law passed by which all granite and other stone ed for municipal or public works must be sent from the quarries undressed. As a consequence the cost of granite has been increased, architects are afraid to specify its employment, and its use in buildings is only occasional. As an instance of the waste of money which is a consequence of what is known as the TOBIN Law, the Albany Capitol may be cited. That notorious building was from the first an experiment in misspending the public funds, but in employing granite experience was surpassed. The cost of the granite recently introduced was 20,000,000 dollars, but if the stone had been dressed at the quarries the amount would be no more than 6,000,000 dollars, or about a third of the outlay. The granite dealers of New York are becoming alarmed at the decline of their business, and are endeavouring to obtain a repeal of the TOBIN Law, but with the labour organisations against them it is doubtful whether they can succeed.

THE jury of the Salon have rattled through the pictures submitted at the rate of about 800 per day. It is evident, therefore, that this year will present as abundant a supply of pictures as any of its predecessors. A new era is supposed to commence with next year; but that makes no difference in expenses. To provide money works must be exhibited and sold. One picture would at the present time have interest for one class of Englishmen, for M. GUILLAUMET has devoted a canvas 40 feet long to the glorification of football. No less than 5,334 paintings and drawings were sent in, a number which is beyond the average.

BARUCH SPINOZA was at one time expected to be a light in Israel, but the new philosophy that was current in the seventeenth century overcame the faith he had inherited. He was excommunicated, and feared his life would be sacrificed. SPINOZA, after a time spent in concealment in the suburbs of Amsterdam, fled to the remote village of Rijnsburg. The small house in which he found shelter still exists, and a few years ago it was purchased by M. ROSENTHAL, a banker of Amsterdam. He had it restored, and then presented it to a society of students of mental philosophy. In the house can be seen SPINOZA'S book-case, with his small collection of Hebrew books, his writing-desk, and the tools employed by him in polishing lenses and spectacles. According to COLERIDGE, "Strong feeling and an active intellect conjoined lead almost necessarily, in the first stage of philosophising, to Spinozism;" but some of those who on March 20 made a pilgrimage to Rijnsburg in order to commemorate SPINOZA would be amused if they were declared to be only in the elementary stage of philosophy.

THE Spaniards were not very enthusiastic about DIEGO VELASQUEZ until they discovered that in other lands he was accepted as the precursor of the modern style of painting. He was born in Seville on June 6, 1599. His father's name was DE SILVA and his mother's VELASQUEZ, so his correct name was RODRIGUEZ DE SILVA Y VELASQUEZ, but he adopted the name of his mother for some unexplained reason and has made it immortal. It is proposed to celebrate his birthday this year with honours that are unusual in Spain. In the National Gallery of Madrid a special room will be assigned for the exhibition of the works of VELASQUEZ. There are between sixty and seventy masterpieces by him in the collection, and probably some more may be lent for the occasion. Another interesting feature in connection with the celebration will be the unveiling of a statue of the painter, for which it is said a site has been arranged in front of the entrance to the gallery.

A MEETING of the Surveyors' Institution will be held in the Council House, Bristol, on Wednesday, the 26th inst. The following papers will be read and discussed:—(1) "Bristol," by Mr. WILLIAM STURGE; (2) "The Railways and the Farmers," by Mr. W. M. ACWORTH; (3) "The Proposed Provision of Workmen's Houses by Loans from Local Authorities," by Mr. HOWARD MARTIN. The members will dine together at the Grand Hotel, Broad Street, Bristol, in the evening of April 26, at 6.30 P.M. precisely. Dinner tickets one guinea each, including wine. On the following day there will be excursions to places of interest in Bristol and its vicinity, Tintern Abbey and Chepstow Castle, Wells and Glastonbury.

VICTIMISED ARCHITECTURE.

A VISIT to St. Paul's recalls the line of the old song about "the woodpecker tapping on the hollow beech tree." The clank of hammers in the operations on the masonry sound strangely in a building where silence usually reigns. If, however, good people assume they would become more devout if their eyes rested on mosaics, stencilling and gilding, who would have the heart to prevent them soaring above the level of a mercenary city? If we may judge by appearances, St. Paul's has become more of a show than formerly, and in the choir itself country cousins are no longer overawed by the associations of the place; but the authorities of the cathedral are, of course, better able to judge of the phenomena attending devotion than are mere laymen, and from the increase of their eagerness to have the building bedizened they must be confident about the spiritual progress of the visitors. Human nature is sometimes moved by causes that are incomprehensible. The Salvationists appeal to wicked and wordly consciences by inharmonious sounds; the Dean and Chapter of London by colours and figures no less odd, and which an ordinary congregation would be supposed to be unable to understand. The two classes of missionaries are equally confident about the certainty of their processes, and both have attracted large sums of money to prevent any decrease in conversions.

In St. Paul's the transformation which is in progress is aided by modern notions of decoration. Once upon a time a decorator was not ashamed to be subservient to the will of the architect and builder. He was glad to undertake certain work, and he performed it to the best of his ability, or rather the quality was determined by the amount of money he was to receive. The old ways have changed. The decorator of our time, especially if he is new to that class of work, has no notion of subserviency. As he comes last he considers all the work hitherto done as only preliminary to his own, instead of being supreme to it. In the Paris Panthéon, although all the painters professed to be guided by the laws of decorative art, PUVIS DE CHAVANNES alone resolved that his work should emphasise the architectural work near it. The remainder have acted with so much independence that walls of match-boarding would serve as well as masonry for the display of their paintings. St. Paul's will present a more incongruous appearance. All the care taken by WREN in the selection of stone was misspent, for it has to be concealed. A plaster surface would make the decoration, which in the minds of the authorities is the supreme idea, far more easy to accomplish, and the elevation of souls would sooner begin. Unfortunately the painters did not originate the innovation at St. Paul's. When WILLIAM BURGES proposed a veneering of coloured marbles for the cathedral as a necessity, he was demonstrating that WREN's work was a failure. Other men who looked on marble as one of nature's vain efforts to become decorative naturally suggested more artificial materials, and nobody can foretell by how many varieties of manufactures STRONG's masonry will be concealed until it disappears.

There is, however, a higher authority than Mr. BURGES for the indifference to architecture which is exhibited at St. Paul's. It is now the fashion to praise MICHEL ANGELO to an extent which REYNOLDS dared not attempt, for he is made out an infallible guide for all artists, for architects no less than for painters and sculptors. But it cannot be denied that the great Florentine possessed a still higher opinion of his own greatness. All things were to be subdued in order that his own work should be exalted. The spirit of co-operation was unknown to him. If occasionally he helped a painter like SEBASTIAN DEL PIOMBO, it was in the endeavour to belittle another man's work, and not for the sake of art. In the Sistine Chapel he made painting serve not only for sculpture, but for architecture. There are piers and cornices supported at intervals by boys as caryatids, which were intended to represent construction in white marble. The Prophets and Sibyls were pretentious in sham bronze, and, to add to the deception, boys in natural colours were placed beneath as supporters of name-labels. The wonderful power of the paintings cannot be doubted, but they have annihilated the architecture, which has disappeared as effectually as the two windows which originally existed at each end of the chapel. How many visitors can now realise that the Sistine was designed by an architect, or that his name was BACCIO PINTELLI? He was so much appreciated by SIXTUS IV. that, according to VASARI, the Pope would not undertake a building without having his advice. He rebuilt the Ponte Sisto, and erected several churches and other buildings in Rome. But PINTELLI is now as ignored as WREN will be if his buildings are subjected to decoration like that of the Sistine Chapel. It is true painters with as much power as MICHEL ANGELO do not appear in all centuries nor in all cities, but the hardihood to meddle with architectural detail is never wanting.

Mr. FERGUSSON, as all our readers know, contrasted the Sistine Chapel with King's College Chapel as typical of two principles of art. He was not a Gothicist, and he had a leaning towards Italian, so that he was not likely to overpraise the Cambridge or underrate the Roman building. He asks:—"Is it better that a building should be ornamented from floor to ceiling with paintings appropriate to its destination, or that it should depend on constructive and architectural details only for its ornamentation? Is it expedient to apply the resources of the highest of the æsthetic phonetic arts to this purpose, or to depend only on an æsthetic form of the technic art of architecture to accomplish this object?" From his possession of a theory of beauty which he devised, Mr. FERGUSSON had to express an opinion favourable to a veiling of walls with pictures, as was the custom in Italy, and which was imitated elsewhere. But he is compelled to admit that "the flat part of the ceiling is certainly a mistake." It depends on the position of the spectator whether the figures appear upside down or not, and "it is impossible to get rid of the feeling that they may or should tumble out of their places." He has also to add that an offence against construction was committed, for there is no telling how the roof is made safe. This condemnation by a judge who is partial to painted walls and ceilings should be enough to make people who have charge of public buildings hesitate before they abandon them to be Italianised by would-be rivals of MICHEL ANGELO. If construction is to be ignored or supplanted by sham cornices, string-courses with painted caryatids, then let us adopt the terrible manner of the Florentine; but so long as there is acceptance of the English tradition respecting construction and demonstrating its existence as if there was no need to be ashamed of it, then a different system of decoration becomes necessary. As FERGUSSON says:—"In our buildings painting was always kept in strict subordination to structural necessities; with the Italians the structure was considered as less important, and never thought to be complete or perfect till the painter had covered every available space with the productions of his art. Even in essentially Tedesco a building as the church of San Francesco at Assisi, the paintings are thought, not only by the Italians, but by most modern critics, as more admirable than the very beautiful Pointed architecture of the church itself." We may be coming to such a manner of judging the arts in England. If so, the "Italian mission" is not to be feared only in its theology. The relative value of painting and other wall-decoration in comparison with architecture is not easily determined, but English common sense can never approve of a building in which it is impossible to distinguish between a substance and a superficial adornment. One effect of the operations we hope will be to impress the clergy and others that a painter is not necessarily so infallible an artist as he is supposed to be by many people. As a rule painters and sculptors concentrate attention on their own work, and will have it predominant, although repose is sacrificed. Examples of what they can do are seen in many Mediæval and Renaissance buildings. An architect on the contrary endeavours to be impartial, and, while he is glad to foster subsidiary arts, he endeavours to avoid the excesses which do not lead to the advantageous display of the arts. He knows what are the advantages of economy, and it is only under his rule that such indiscretions as are apparent in WREN's Cathedral can be avoided. But as Lord WINDSOR says, "What strikes one most forcibly is that the artist (painter) of to-day is wholly out of sympathy with the architect of the seventeenth century; his idea, it seems, is not to beautify but to transform. WREN's noble pile depends entirely upon the simplicity of its lines and the proportion of its detail, and any decoration out of scale must destroy the sense of simplicity and proportion."

ECHOES OF THE YEAR 1829.

THERE are some subjects which appear to be always recurring in London. Among them are improvements of Government buildings. In 1829 as in 1899 the est way of dealing with some of the offices was accepted as difficult problem. JOHN SOANE, the architect (he was ot knighted until 1831), issued for private circulation in 329 a volume which bore the following lengthy title :— Designs for completing some of the Public Buildings in Vestminster, and for correcting Defects in others : humbly ubmitted to the consideration of His Majesty, the Iembers of both Houses of Parliament, the Lords Commissioners of His Majesty's Treasury, the Judges of the veral Courts, the learned Counsel practising in those ourts, and to the Surveyor-General of His Majesty's Vorks." SOANE said that in 1820 he was honoured with a mmission to prepare designs "for new Law Courts, to be ected on the space between the south-west turret of the one building at St. Margaret's Street, leading to the trance into the House of Commons, and north-west wer of Westminster Hall, projecting in New Palace Yard far as the buildings erected in the reign of Queen LIZABETH, and which abutted on the west front of the rth-west tower of the Hall." The site proposed was erwards materially circumscribed, but votes were granted d the buildings were far advanced when, in March 24, "one of the great luminaries of the law" Id that a part at least of the new structure was a miserable excrescence of the Bœotian or sixth order architecture," and ought to be razed to the ound. It was stated on the same occasion that SOANE s bent on the destruction of whatever part had survived the ancient Palace of Westminster. The architect mainned that his critic lived in Old Palace Yard, that he had amined the works while in progress and seemed pleased th what was being done. Finally, SOANE, as proof of his nservative treatment, pointed to the Painted Chamber, hich, instead of being demolished as alleged, remained altered in all its essential parts. SOANE had created many emies against himself, and his efforts "to combine together e classical simplicity of the Grecian architecture, the gnificence of the Roman and the richly varied effects so ongly marked in our ancient ecclesiastical structures," wever ingenious and anticipatory of experiments in our ne, were not approved by critics. SOANE could afford to indifferent to the numerous attacks against his skill, for was wealthy. A few months afterwards he was able to bscribe 1,000*l.* towards the erection of the column which a memorial of the Duke of YORK. Another architect who s put under the microscope in 1829 by the House of mmons was JOHN NASH, and a more easy subject for erse criticism than Buckingham Palace could hardly be nd in any part of the metropolitan area.

London and all England would be poorer if a fire ich broke out on April 27, 1829, had not been supssed. On that morning Westminster Abbey was in nger, but fortunately the flames were extinguished before ch damage was caused. The decoration of St. Paul's thedral was another subject which claimed some attenn in 1829. The building had been cleaned, which was expensive operation. But the authorities and their rkmen were unable to approach THORNHILL'S paintings he dome, and the contrast between the upper and lower ts of the building was therefore most disagreeable. The ntings could not be touched owing to the expense of ffolding. At the time E. T. PARRIS, an artist who, with ne reason, believed he was destined to paint the nest class of subjects, could not find patrons his scripture and historical pieces on a large e, and he was compelled to accept an engagement to nt a panorama of London for the Colosseum in Regent's k. The dome was 30 feet larger in diameter than Paul's, and as the painting must be executed at a cheap , necessity made Mr. PARRIS an inventor, and he sed a series of flying and swinging scaffolds for himself his workmen. He showed the invention to Professor KERELL, who at once brought it under the notice of the n and Chapter. Mr. PARRIS was commissioned to h up THORNHILL'S paintings, but the work took a long to complete. We suppose THORNHILL'S paintings will be removed sooner or later, but where is the artist to be found who will treat the dome with as much reverence?

The Colosseum, which was accepted as a marvel, was opened on January 14, 1829. The building was designed by DECIMUS BURTON. It had two objects : one was a tower with galleries, which anticipated M. EIFFEL'S structure. From the highest stages the great panorama around the dome was to be seen. On the top was the old ball which had been removed from St. Paul's Cathedral. About the same level were concert and dancing-rooms, and then a flight of stairs led to an outer gallery, from which a view of London could be seen. The tower was formed of timber, with a curb of brick and iron bracing. On the ground floor were galleries for the exhibition of works of art, saloons, conservatories and refreshment-rooms. The great panorama was painted from sketches which Mr. HORNOR made from a temporary observatory which was erected for the purpose above the cross of St. Paul's. The sketches were enlarged by Mr. PARRIS sixteen times the original scale, and then painted in oils on prepared canvas. It was difficult to obtain the desirable co-operation, for when artists were employed they endeavoured to express their own individuality, and as a consequence the panorama was without any uniformity, and was a failure. Mr. PARRIS was therefore obliged to paint out the greater part of what had been done, and with the aid of a band of house-painters who were trained by him, to recommence the work. Enlarging and painting occupied about four years. The building would not now be tolerated, but it afforded much enjoyment to the simple people who lived seventy years ago. A visit to London was considered incomplete unless it included acquaintance with the glories of the Colosseum, for which the admission fee was no less than five shillings.

Another building of a more important character, although affording less pleasure, was the new Post Office erected by SMIRKE on the site of the ancient ecclesiastical buildings of St. Martin's-le-Grand. The old building was not without interest. It was formerly the residence of Sir ROBERT VYNER, but had been occupied as a post-office from the days of Queen ANNE. From time to time alterations were made to cope with the increase of correspondence. The most important were those carried out from the designs of JOHN THOMAS GROVES, who was appointed architect in 1807.

The present Postmaster-General as Earl Marshal is head of the Heralds' College. He would have been interested in a proposal which was made in 1829 to publish the proceedings in the cause between Sir RICHARD LE SCROPE and Sir ROBERT GROSVENOR, in the reign of RICHARD II. This cause, relative to the coat armour of the parties above named, so remarkable in the annals of heraldry, lasted four years, and was tried before the Lord High Constable. The record abounds in valuable illustrations of history, and throws a strong light on the general state of society in the fourteenth century. Upwards of 300 persons were examined on the question, who were either peers, bannerets, knights or esquires, or abbots, priors or other clergy ; and as each of the peers, knights and esquires deposed to his age, the battle or siege at which he commenced his military career, the number of years and the occasions on which he had borne arms, and to circumstances connected with his services or the services of his ancestors ; and as the clergy alluded to manuscripts and monuments in their respective abbeys and churches, this trial is rich beyond example in historical, biographical and topographical facts. The existence of such a document suggests the difference between Mediæval and modern times in regard to heraldry.

Another subject which excited the interest of archæologists was the discovery of a maniple and stole in the tomb of St. CUTHBERT at Durham. They were in a remarkable state of preservation. The gold lace, which appeared to be constructed solely of fine gold wire partially flattened and without any admixture of silk thread, retained its metallic colour and brilliancy almost as freshly as when it was first put on, nearly 1,000 years ago. By an inscription in embroidery, perfectly legible, the vestments appeared to have been the gift of ÆLFLED to FRITHSTAN—a circumstance which at once fixes their date beyond all dispute to the earlier part of the tenth century. However, in the whole catalogue of English bishops there is but one FRITHSTAN, or FRITHESTAN, who, according to the most trustworthy

authorities, succeeded Denewulph in the see of Winchester, A.D. 909, being one of the seven prelates simultaneously consecrated by Plegmund, Archbishop of Canterbury, in pursuance of the mandate issued by King Edward the elder (son and successor of the illustrious Alfred), as the condition of removing the papal interdict under which the kingdom had been placed, in consequence of a previous neglect in filling up bishoprics. According to one tradition, Denewulph was the neat-herd who owned the cottage in which Alfred took refuge, and where the king neglected to turn the cakes and suffered merited abuse. But the legend will not sustain scrutiny. There was a Bishop Denewulph, and Frithstan succeeded him and ruled at Winchester until 931. Drawings of the stole and maniple were made at the cost of the Society of Antiquaries.

Sir Thomas Lawrence was the President of the Royal Academy in 1829, and therefore presided at the distribution of the medals on December 10. It was the last occasion he was to officiate, for he died after a few days' illness before a month had elapsed. The prizemen were the following:—In painting, the gold medal was awarded to George Smith; the gold medal for sculpture to James Legrew; the gold medal in architecture to William Grellier for a design for a British Senate House; for the best copy from Vandyke (*Holy Family*), Richard Augustus Clack, the silver medal; the same prize was also awarded to H. L Smith, but as he had already obtained a medal the prize was withheld, according to the Academy's rules; for the best drawing from life, the silver medal to J. H. Millington; for the same to F. Goblet, also withheld on the same ground as Mr. Smith's; for the best model from life, the silver medal to R. C. Lucas; for the best elevation of a banqueting-house (class of architecture), the silver medal to J. W. Pusey King and William Barnes; drawings from the antique, the silver medal to D. Maclise and John Bell; models from the antique, the silver medal to Richard Warren and E. G. Papworth. As has happened very often in the history of the Academy schools, the majority of the prizemen did not attain distinguished positions as artists. Maclise was the most successful, but he had already gained some reputation. In 1829 an engraving after his portrait of Ude the French cook was published, and his *Malvolio affecting the Count* appeared in that year's exhibition. John Bell, the sculptor, attained some popularity in connection with the exhibition of 1851, and his *Una and the Lion* in porcelain is still to be seen in the windows of dealers in pottery. Grellier ten years afterwards gained first premium for the Royal Exchange, but he could not withstand Tite's influence and diplomacy, so he failed to obtain the commission. His most important work was the Royal Exchange Insurance Offices, Liverpool.

In 1829 the steel plates of the "Annuals" were in favour, and although some of them were marked by a prettiness that afterwards brought all the plates into ridicule, it must be owned that the foremost painters and engravers of England aided in their production. The "Annuals" were an indispensable accompaniment of Christmas, and continued to be so until they were supplanted by the red-covered stories of Charles Dickens. In our days it would be difficult to produce plates of equal merit, for engraving like that of the Findens and the Heaths has succumbed to etching and photographic processes. Plates on a large scale were also in favour. George IV. was considered to be as suitable a subject as could be discovered. The Princess Victoria was lithographed by Lane, and the print was said to be "a charming little head." Then there was the perennial Duke of Wellington. Portraits of fashionable ladies were in request, as well as actors and actresses. The most important engraving of the year was Vendramini's *Raising of Lazarus*, for which a gold medal was awarded by the Society of Arts.

There were several costly illustrated books issued by the publishers, such as Brockedon's "Passes of the Alps," Turner's "England and Wales," John Coney's "Ancient Cathedrals," and Britton's "Picturesque Antiquities." There were some works published on architectural subjects, of which the most interesting was T. F. Hunt's "Exemplars of Tudor Architecture." In it were many extracts from old manuscripts and books which cast sidelights on the period described. Some of the nobles who erected mansions in London were proved to be unscrupulous about the sources from whence the materials were derived. Somerset House owed much to a chapel of Old St. Paul's and the palaces of the Bishops of Worcester, Lichfield and Llandaff. The aristocratic builders believed they could be provided with labour on the same terms. The plain-speaking Bishop Latimer was compelled to adjure them to be honest. In one sermon he said:—"For the love of God, let poor workmen be paid. They make great moan that they can get no money; the poor labourers, smiths, carpenters and other crafts cry for their wages. They be unpaid some of them three or four months, some of them half a year." The wages were not very high. The average price of labour was sixpence a day. A best joiner had eightpence and a labourer fourpence, with sixteenpence a week per head for board. Carvers, masons and sawyers seem to have been of equal value. Those who exult in the picturesqueness of the Strand in Tudor days are silent about the economical terms on which the buildings were raised.

Although the independence of Greece was not formally recognised by the Sultan until April 1830, yet the Turkish viceroy was compelled to leave the isles in 1828, and in 1829 peace was made between the Allied Powers on behalf of Greece and Turkey. But Jussuf, the pasha who ruled in Athens, was left without any information about the change. A correspondent, writing in October, gave the following account of the state of the city:—"There is not a house in Athens; everything is turned topsy-turvy, and there is not a street that can be recognised. The inhabitants have all fled. The temples of Theseus and of Jupiter Olympius, a portico of Hadrian, some immense columns of the Parthenon, the Lantern of Diogenes and the Tower of the Winds rise amidst the most confused piles of ruins. The falling of the walls in which several masterpieces were fixed has disclosed some remains of antiquity hitherto unknown, so that Colonel Borg de Saint Vincent was able to observe some gigantic caryatids, the legs of which end in serpents, which had never yet been seen by any traveller or antiquary."

The work of reconstruction in Greece was onerous, but when the obstacles to prosperity are remembered it must be allowed that the seventy years which have elapsed since independence was secured have brought fewer disappointments than were anticipated in 1829. Let us hope that in 1969 as much can be said about the experiment England has commenced in Africa. One prophet at least whose utterances were heard in 1829 could only see in his visions a Nile valley that was doomed to inevitable ruin. General Sir Rufane Dunkin, who for a long period devoted himself to a profound study of the Nile and the Niger, concluded that the surrounding desert was the enemy of all man's work, and was bound to conquer in the end. In one passage of his dissertation he says:—

If we turn to the valley of the Nile of Egypt, we shall see at this moment the very process going on by which the lower part of the Niger, or Nile of Bornou, has been choked up and obliterated by the invasion of the Great Sahara, under the names of the Deserts of Bilmah and Libya. Thus has been rubbed out from the face of the earth a river which had once its cities, its sages, its warriors, its works of art and its inundation like the classic Nile, but which so existed in days of which we have scarcely a record. In the same way shall perish the Nile of Egypt and its valley, its pyramids, its temples and its cities. The Delta shall become a plashy quicksand, a second Syrtis, and the Nile shall cease to exist from the Lower Cataracts downwards; for this is about the measure or height of the gigantic principle of destruction already trading on the Egyptian valley, and who is advancing from the Libyan Desert, backed by other deserts whose names and numbers we do not even know, but which we have endeavoured to class under the ill-defined denomination of Sahara—advancing, I repeat, to the annihilation of Egypt and all her glories, with the silence, but with the certainty, too, of all-devouring time. There is something quite appalling in the bare contemplation of this inexorable onward march of wholesale death to kingdoms, to mighty rivers and to nations; the more so when we reflect that the destruction must, from its nature, be not only complete but *eternal*.

The general could not have anticipated that seventy years afterwards the work of English engineers and English contractors would be able to stem the advancing desert and subject nature to English control.

ANTONIO ALLEGRI OF CORREGGIO.

[HOSE who believe that wall-paintings should be architectonic in treatment will not find a model be followed in any of the works of ALLEGRI, who is tter known as CORREGGIO. He did not, possibly could t, submit to any restraint. The traditions of masters re not accepted by him as binding, and he might be nsidered as a creator of a school rather than as the eritor of principles. ALLEGRI's way of discovering ojects for mural decoration is suggested by his work for Abbess of the Convent of St. Paul, at Parma. JEANNE PLAISANCE was an aristocrat by birth, and from her sition she was a spiritual princess who claimed equality h all ecclesiastics below the Pope. When the young nter was invited to adorn the living room of the tur- ent nun he did not think of scenes from Scripture or n the legends of the saints, or incidents in the life of NNE, which were dramatic enough, as suitable sub- s. He proposed instead to paint scenes which ld recall the goddess DIANA. He had no desire pay a tribute to the revived paganism which was be witnessed in some parts of Italy, nor did he h to suggest there was any resemblance between celestial huntress and the ruler of the convent. saw on her family shield three crescents, and they gested the "goddess excellently bright" of whom ALLEGRI, many other painters, must have had glimpses in his ing dreams. To this fancy or caprice all the necessities lecorum or fitness were sacrificed. Nor was ALLEGRI e respectful to the mythological tradition. DIANA was lover of children, as the little boys knew who were arged at her altars. But ALLEGRI idolised them, and ordingly he painted parts of the room to suggest a yard, and introduced several amorini as if they were inhabitants. In his eyes childhood and discipline were ngruous. The infants were, therefore, not shown in nced groups, but appear with symbols, arms, fruit, in joyous disorder which is natural to their years. The p is a defiance of law, order and the myths, but it naracteristic of the spirit in which ALLEGRI interpreted subjects. It is an Olympian revel with PUCK as master he ceremonies, a "Midsummer Night's Dream" which mes more fanastic from its connection with a convent CORREGGIO, like SHAKESPEARE, dared to be original, ugh his erudition might be doubted when he treated ue subjects.

n a like spirit he adorned church domes with paintings. ther he was aware of the importance and the difficulty ne construction we cannot tell. Probably the painter indifferent about the skill which was necessary to secure nry in safety without any visible means of support. saw only a suggestion of the aerial region above the , in which birds moved at ease. The ample space ented an opportunity to display his skill in representing , women and children bestriding the lazy-pacing clouds iling upon the bosom of the air. To depict row above of saintly beings in heavy robes and with serious itenances in the manner of earlier masters would e his painter's instinct revolt, for that was a con- ionality which took no account of the conditions he upper world in which the events were supposed ake place. It was a vision of cloudland which painter dared to depict, and, unlike his critics, new it would be a failure if he adhered to the laws h impose a limit on all earthly existences. Gravitation nipotent here below, and in consequence some of us tately in our bearings; but were we emancipated from ower and able to move as we please in a different um, we might display the marvels of foreshortening n are to be seen in St. John's Church and in the dral of Parma. The President of the Academy, in of his lectures, rebukes the artists who made their and prophets write on scrolls of paper without any to support them. But if we can imagine bodies ut weight, like CORREGGIO's creations, it is allowable they should use clouds as thrones or as book-rests required. The whole difficulty is with the late. Let it be once granted that beings in human can exist in the atmosphere, and the appearances present will be a case of inference. They may be huddled into lumpish figures, or be extended like swimmers, or even appear like "a dish of frogs," which was the judgment of one of the spectators who stood beside CORREGGIO; but strange as is the aspect, we are not to test its accuracy by using ordinary life as a standard. "Truth to nature" does not apply to the figures on CORREGGIO's domes, for he has soared beyond the natural, and we should make as many concessions in his favour as we do for writers who endeavour to describe life in regions which are beyond the experience of travellers.

ALEXANDRE DUMAS once said, with reason, that we can never understand "Hamlet" because we have no certain knowledge of its creator. ALLEGRI's works would be less difficult to understand if we possessed a faithful biography of the artist. As it is, he becomes a legendary being as uncontrolled by the conditions of common life as any of his cloud dwellers. According to VASARI, his life was a martyrdom. Melancholy marked him for her own, his family was an oppressive burthen, his virtue was upheld at the cost of irrational afflictions, he was ignorant as well as poor, unacquainted with the productions of antiquity or with the masterpieces of his own age; he was so insignificant in his own eyes that he never made a sketch of himself, nor did any of his contemporaries attempt his portrait; finally, he was so little valued that payment in coppers was made to him for his works, and his death in his fortieth year was caused by the fatigue he underwent in carrying a sack of that kind of money on a hot day. VASARI pitied the painter, and although he could introduce an occasional malicious trait in his biographies, in this case we believe he recorded only what he believed was true. Since VASARI wrote many efforts have been made to investigate the mystery which surrounds ALLEGRI's life, but in spite of so much labour there is darkness which cannot be entirely dispersed.

Enough appears to be now known to make us doubt the theory of CORREGGIO's miserable life and constant depression. He was occasionally obliged to paint subjects of a tragic kind, but the general character of his works reveals a tendency towards those which were pleasing. The charming *Education of Cupid* in the National Gallery is a type of one class of his works, which owe their interest to the domestic affection which inspires them. CUPID might be one of the artist's children, and his mode of study derived from a scene which was not imagined. There is so little of the posed model about the amorini painted by CORREGGIO, we must conclude that he often gave records of nursery scenes of which he was the delighted witness. Even when they are introduced as angels his children retain confidence in their supremacy as favourites, and they are none the worse for looking as if they were ready to become mischievous if the opportunity arrived. It has been often remarked that his Madonnas are rarely sorrow-stricken; the painter had not the heart to depict a martyred maternity. With so many facts about women and children recorded on canvas, we cannot believe that ALLEGRI considered his family to be an oppressive burthen. Judging by his pictures, it is safe to conclude that his home life was exceptionally happy. Some of his pictures are indeed signed "LIETO," or the happy man.

As to poverty it is also doubtful. His father, PELLEGRINO ALLEGRI, was a cloth merchant, and was in a position to have his son trained to become a scholar, which in the beginning of the sixteenth century gave a position that could become a passport to official employment. But he felt he was not made for statesmanship. He possessed powers which enabled him to dispense with the training required in those days by all students of art. All Rome, and the works of MICHEL ANGELO in particular, according to REYNOLDS, served as an academy for RAPHAEL, but ALLEGRI had no advantage of that kind. Correggio, like other towns in Lombardy, was more suited to make a condottiere of a young fellow than a painter. The only artists in the place were humble men who were able to aid in the fêtes which followed success in the little wars in which the lord and his retainers took part. Yet their instruction sufficed for the young ALLEGRI.

From the position of his father and his precocious ability the young artist was early noticed by his sovereign lord, MANFREDI. When the count was obliged to visit Mantua in order to escape a visitation of the plague, he

brought Allegri with him. The artist was then seventeen. There, in addition to many works of art, he saw the frescoes of Mantegna, which drew from him the famous exclamation, "Anch' io son pittore." According to some writers it was the sight of the Sistine Madonna which inspired the words. It would perhaps have been better if Allegri then saw paintings in which there was less display of foreshortening and perspective; but a comparison with Andrea Mantegna's works demonstrates how much was derived from his own sense of beauty. Raphael himself did not possess more facility for the expression of grace. Judging by certain qualities in Allegri's works, such as his skill in light and shade, and the mysterious beauty of the faces which surpasses that of Italian women, it is concluded that he must have come under the influence of Da Vinci. But no research has yet succeeded in discovering how it could be accomplished. It could hardly be direct, for Allegri was no traveller, and there was nothing in Correggio to attract so great a man as Leonardo, who made his journeys like a prince, and was therefore costly to entertain. The master, it is said, painted a picture or two for the Duchess of Mantua; but, however great was Allegri's insight, he could not acquire Da Vinci's manner from so limited an exemplification. It is more reasonable to suppose that the two artists were endowed with similar qualities, which enabled them to see nature under novel aspects.

Assuming that Allegri was born in 1494 he would then be twenty when he was recognised as a master. He painted an altar-piece in his native town, for which he received about 200*l*. When so much value was set on his works he could hardly be considered as a poor man. His reputation was not likely to be confined to Correggio, and in his twenty-fourth year he sought a wider field in Parma, and, as we have related, found a patroness in the Abbess of St. Paul. His stay in the city was not long, for in a year or two he was again to be found in Correggio, where he married. He was then tempted to return to Parma, and his changes between the two places resembled Dr. Primrose's migrations from the blue bed to the brown. Why he was not induced by some of the greater princes or ecclesiastics to seek a more important residence is now incomprehensible, for inferior artists were able to enjoy support to which Allegri was always a stranger. Rome was a centre of attraction which was irresistible, but Allegri was beyond its power.

In 1520 he obtained the commission for the decoration of the cupola of St. John, over 2,000*l*. being promised for the work. It was painted for a guild. In the cathedral the employers of Allegri were the monks, who were, it is related, dissatisfied with the composition, or rather with the price (1,200 golden ducats) which had to be paid to Allegri. It is related that ten years after the completion of the paintings the opinion of Titian was asked whether value was given for so large a sum of money. His reply was that if the dome were reversed and filled with ducats it would be an insufficient reward for so great a work. The praise was generous and worthy of Titian. It was unfortunately expressed too late to afford pleasure to Allegri. The painter who brought credit to Correggio and made Parma famous had died suddenly in 1534 in his fortieth year. According to Vasari, Correggio was the place of his death as of his birth, but as there is neither record nor tombstone there can be no certainty on the subject.

Some painters who have died as early as Allegri covered as much canvas and wall space. It would, however, be difficult to find another who executed so many renowned works after so restricted a training. Allegri is an example of what inborn genius can accomplish with aid that for ordinary students would be insufficient. The humblest youth that attends a school of art in London, Manchester or Birmingham has means of learning which were beyond Allegri's resources. Yet in spite of all the difficulties which were around him, Allegri became, as Mr. Ruskin says of him, "the captain of the painter's art," for as he continues, "other men have nobler or more numerous gifts, but as a painter, master of the art of laying colour so as to be lovely, Correggio is alone." But while admitting the loveliness of his work it is to be regretted that he was never able to rise in thought to the level of artists who were inferior to him in technique.

THE FITZWILLIAM MUSEUM.

THE syndicate of the Fitzwilliam Museum, in their fiftieth annual report for the year 1898, state that the number of visitors during the year was 39,960, and to the Museum of Classical Archæology 5,045. Permission to copy during the same period was given to forty-two persons at the Fitzwilliam Museum and to eight at the Museum of Classical Archæology. Among the gifts specially mentioned are the following:—Two pictures by Mr. T. B. Bumpstead of Trumpington. One is a painting on panel, of the school of Holbein, dated 1549, representing a man and his wife; the other is a portrait of an old man by the sculptor Bernini. Professor W. M. Flinders Petrie has presented a number of specimens of pottery, mace-heads and smaller objects, found during his excavations on behalf of the Egyptian Research Account in 1898. An engraving of the interior of the Leyden University library by Woudanus and a collection of forty-eight engraved portraits of Cambridge celebrities have been presented by Mr. J. W. Clark, M.A., Registrary. Mr. Pendlebury has presented during the year fourteen volumes and sixteen unbound pieces of music. The principal purchases have been:—A MS. of Aristotle's "Analytics" of the fourteenth century, written in Italy, with illuminated initials. A copy of the German version of Sir John Mandeville's Travels, printed at Basel, *circ.* 1480, with numerous hand-coloured wood cuts. (Brunet, Supplement I. 931.) A series of photographic reproductions of pictures in the Prado Gallery at Madrid and of pictures by Rembrandt in the galleries of Berlin, Cassel and Dresden. A facsimile reproduction of a thirteenth-century MS. of the "Lapidario del Rey Alfonso." A set of E. aus'm Weerth's publications of monuments of early Rhenish art. Two water-colour drawings by T. M. Rooke, namely, a view of Troyes (Aube) and one of Beaugency (Loir-et-Cher). A volume of miscellaneous engravings by (and after) Martin van Heemskerck, the elder Brueghel and other artists of the sixteenth and early seventeenth centuries. A gold ring (probably episcopal of the thirteenth century), set with a sapphire, found near Fordham, in Cambridgeshire.

TESSERÆ.

Effect of Foreshortening.

PAINTERS are not only careful to foreshorten correctly all the objects which they portray, but they often avail themselves of the principle to produce most striking effects. For instance, Martin in many of his vigorous designs, by judicious foreshortening, has exhibited miles in extent of gorgeous architecture and of armed men, on a space of canvas that would seem scarcely more than sufficient to receive a few figures; he has made a single magnificent pillar or accoutred warrior placed in the foreground, become the type which first fills the mind with admiration, and then sends it along the retiring line of beautiful perspective, where every tip or edge renews the first impression. A man lying on a table or a bed nearly as high as the eye, with his feet towards the spectator, is foreshortened into a roundish heap, of which the soles of the feet hide the greater part. This is the description of the painting which has been called the miraculous Entombment of Christ, and it is because an unreflecting spectator moving sideways with the expectation of seeing more of the body, still sees only the soles of the feet, and may suppose the body turned round so as to front him, that the painting has received its appellation. For nearly the same reason the eyes of a common portrait may seem to follow a spectator to whatever part of a room he goes. A rifleman represented as taking aim directly in front of the picture will seem to have in his power every spectator standing in the room; for, as in the case of the miraculous Entombment, every spectator present will feel as if he alone could see the picture as all see it.

Ancient Roman and Italian Renaissance.

It seems, notwithstanding the vast destruction which the Goths occasioned in Italy, from sufficient remains that could not but have existed, reasonable to conclude that the earliest palaces in Italy, after the revival of the arts, must have partaken in some measure of the arrangement and design of the palaces of ancient Rome, which beyond question were as different from the houses of the Greeks as were the customs of the two countries. Pompeii furnishes no clue either to the plan or elevation of a Roman house. "Scalis habito tribus altis" gives a notion as to height, which under Augustus was limited to 70 feet. The great courtyard was then a feature as it still is, in the palaces of Italy, and there can be little doubt that the modern palaces are not very dissimilar to the edifices of ancient Rome, making sufficient allowance for change of habits. In how many things, agricultural for instance, may the similarity between the ancient and modern practices in Italy be traced! Is it not then allowable to assume that the modern is very much founded on the model of the ancient buildings? If it be not so, the greater is the respect due

ose illustrious architects who designed and executed the alian palaces of the fifteenth and sixteenth centuries, which ıve been the foundation, in point of arrangement, of all odern edifices, into which comforts have been gradually troduced suitable to higher civilisation and dependent on e customs of the people. To the Greeks, at all events, we e not indebted for these; our debt to them is limited to the plication of Grecian Doric columns to modern buildings, to ıich, however beautiful in their original application, they are ɔm circumstances now totally inapplicable, nay, even in their plication altogether obviously absurd. The mere mention the obstruction of light and heat in this climate, and that of ance and Northern Germany, is sufficient to show how applicable is the style.

The Revival of Architecture in Italy.

The extraordinary volume published by Aldus, in 1499, der the title of "Hypnerotomachia Poliphili" (Poliphilus's eam of the Battle of Love), seems to have been one of the ncipal incentives to, or rather incidents that quickened, the ival of architecture in Italy. The author of it describes and ɔups, with great beauty and effect, the most splendid emblages of objects of art. Decorated with wood engrav-gs of singular beauty, in which the details and accessories are ictly classical, written with great spirit and elegance, its ect at the period must have been magical, and doubtless, th the aid of the celebrated treatise on architecture by Leo. t. Alberti, whose appearance was nearly contemporaneous h it, little more than those two works could have been nting to enlist all Italy, the hot-bed of art, in its restoration. ɔm Vasari may be gathered the distaste for Gothic archi-ture, which had fully ripened when he wrote. The Italian ıool, which finally settled itself in the adaptation of the ient Roman orders and their details to comparatively dern habits, was engrafted at first on Gothic designs. stances of this may be produced in the splendid loggia of gagna, in Sta. M. dei Fiori, and many other buildings in ɔrence, in Pisa, Siena and other cities. Brunelleschi seems have emancipated himself from the mixture of two such cordant styles. Still there continued, as we see in the ardi, Strozzi and other palaces in Florence, a lingering love the mixture, of which the architects could scarcely divest mselves. Yet when they came to the cornices, the massive, ɔroken cornices of their palaces, the littleness of the other ts is so completely lost that it is evident they were actuated the same feelings of unity and breadth that lent so much ıe to the best works of the ancients. From the time of ınelleschi to the time of Borromini—with whom the Italian ool closes, indeed from the spirit of innovation and wretched e of this last artist architecture seems to have previously n its best days—included a period of about 270 years, during ch so much was done that Italy may be fairly said to have rbuilt herself.

The Tower of London.

If the Tower of London had a tongue, it could tell more ıghts of great men and great women, of festal days and nts of sorrow, of triumphant bigotry and hallowed martyrdom, n perhaps any castle in the wildest regions of romance. It been everything in turn. Originally the palace of the narch, it became a fortress, and the fortress became a on. This was the fruit of the desperate times which men in the habit of calling the good old days of their ancestors. ce was the grand instrument and defence the grand object. ry man's hand was against every man; and from the king the peasant, every man's safety was in the sword by his t. It will, however, be admitted that society in England more secure than on the Continent; four centuries ago ry road in Germany was covered with licensed robbers, ɔse head-robber, calling himself a baron, lived in a fortified se in the next forest, which he called his castle. Three turies ago no man ever stirred a league before his town-s without the chance of being slaughtered by a party calling nselves cavaliers, soldiers of the faith, or free lances. In land, fifteen hundred of those fortresses had been built in reign of Stephen alone; and as if to show that, with all our rness, we could be as mad as the rest of the world, and than the rude clans of Germany or the volatile villany of ıce, our civil wars in the middle of the seventeenth century in three years cost the lives of nearly 100,000 English nen, nobles and gentlemen. But a strong distinction must ıade. Fortresses within a country have uniformly been a of barbarism; fortresses on the frontier of a country have merely been a sign of national strength, but a source ll the "appliances and means" of national improvement. ıtier fortresses saved the trouble of being always on the h. The trader was allowed to go to his counter, the work-to his shop, the peasant to his plough. They had all once armed, or not at all. But with a few stout fortresses een them and their enemy, they now felt that they could not be surprised, that some breathing-time must be given before they were required for the field; and this breathing-time suffered them to throw aside their pikes and arquebusses and follow their natural employment. Thus the Continent has to thank bastions and battalions for its crops, its comforts and its civilisation. England had a fortification in its great ditch—the Channel—worth all the battlements since the building of Babylon; and its security from all foreign assault, unless by a maritime force, which no foreigner possessed since the time of the Danes, must have made it a prosperous people, except for those unlucky feuds to which the factions of York and Lancaster gave occasion, and yet which probably were the discipline essential to preparing the country for the dominion of law by sweeping away the baronial race, who acknowledged no dominion but that of the sword. The Tower of London was originally built to defend the river and to constitute a citadel; while the present district called the City constituted London, and the City itself was a fortress. Standing on a rising ground at the south-east, overlooking a portion of London, which once contained the houses of the chief nobility and the property of the principal traders; by its guns commanding the course of the Thames, and protecting the anchorage of the merchant ships, which in those days moored in the current, it formed an important place of strength; and being large, capable of every kind of royal decoration, and being secure alike from the tumults of the citizens and the assaults of a foreign enemy, it offered a suitable position for the residence of the sovereign in early and troubled times.

Claude Perrault.

Louis XIV. sent for Bernini to design the additions and alterations contemplated at the Louvre, and it was a happy thing for France that this high and haughty architect was disgusted with the workmen of Paris, and returned to Italy without executing his designs, for, grand as they were in respect of dimensions, they were exceedingly corrupt in composition. But there is a still weightier reason why France had cause to rejoice in their rejection, which is, that it gave Perrault an opportunity of ornamenting the capital with one of the most splendid monuments of art that Europe can boast; one which changed the heavy style then in vogue, and gave the French artists that impulse whose power is still in action upon them. The beauties of the façade of the Louvre so completely overpower its defects that one overlooks its coupled columns and the arch of the central door rising into the storey of the colonnade. It seems to be the fate of architects to fall under the lash of poets. Ben Jonson lampooned Inigo Jones in his "Bartholomew Fair," under the title of Lantern Leatherhead. Pope and Vanbrugh did not very well agree. So Perrault, whose first profession was that of medicine, which, however, he only practised for his friends and the poor, having spoken ill of one of Boileau's satires, was told by the poet that "de méchant médecin devient bon architecte." Perrault competed in this work with Le Vau, the king's principal architect, against whom and others he was successful; he was, however, assisted in the execution, as it is said, by that artist, though, from Perrault's intimate acquaintance with the several branches of science, one can scarcely believe the assistance was necessary. Contemporary with Perrault was Le Mercier, the architect of the church of St. Roch, in the Rue St. Honoré, at Paris, who followed, but with much originality, the precepts and principles of the Venetian school, and died in 1660, twenty-eight years before the decease of Perrault.

Wren's Style.

There is no work of Wren's which betrays an exaggerated or a false taste. There is a harmony of parts, a justness of proportion, a judgment in the general design and a propriety in the decoration that disarm criticism, and that please even the uneducated. This arises no doubt chiefly from that quality we call genius, and which the ancients call *mens divinior*, that which animates the poet as well as the painter and architect; but in Wren's case this was strengthened and corrected by a profound mathematical as well as practical knowledge of construction, and a minute acquaintance with detail. His great principles may be summed up in three words—utility, propriety, beauty: principles which have been the guide of every true architect in every age and in every style. In Gothic architecture he was less successful. The spirit was extinct, and all its traditions departed, and forgotten both among architects and workmen. His detail therefore, as might be expected, offends us now; but if we look at the general arrangement of the masses of St. Michael's tower and St. Dunstan's-in-the-East, the general idea of the gateway at Christchurch, and, in fact, many other attempts in the Mediæval manner, even prejudice must concede that, had he lived in the present day, when styles are so well classified and defined, and when workmen abound who can execute groining, tracery and carving, when all appliances and means are ready to the hand, he probably would have excelled as much in Gothic as in Classic art.

NOTES AND COMMENTS.

THE lining of the walls of private and public picture galleries is an important operation. There are differences of opinion among experts about the most suitable colour, and what satisfies one guardian may be a failure in the eyes of his successor. Hence it is that so many are in favour of the use of a material which can be easily changed. In the National Gallery a "flock" paper was used by Sir F. W. BURTON, and it presented an agreeable appearance and as a background was effective. But Sir E. J. POYNTER says that the "flock" was found to collect dirt and also to fade rapidly. An experiment was accordingly made in 1897 in the Umbrian Room with a varnished embossed paper, the decorations of the room being at the same time renewed. The result at the end of the year was found to be very satisfactory as regards cleanliness and durability, and when the time came in the course of 1898 to redecorate and renew the papering of the principal staircase and vestibules and of four rooms, papers of a similar character were employed. Sir E. J. POYNTER says there is a great improvement in appearance of the walls and an undoubted gain to the pictures. It is hoped that a similar course will be pursued with the remaining rooms, as, from time to time, it becomes necessary to replace the flock papers with which they are now hung. At the same time, the experiment having been tried of removing the railing in front of the pictures in one of the rooms, it was found to be so greatly to the advantage of the pictures, that the railings were taken away throughout all the rooms containing the foreign schools. It has thus been possible to place some of the larger pictures in a better position by lowering them to the dado, and the ugly reflection of the rail in the glasses is avoided; the effect is also to give the Galleries a more spacious appearance. As all the pictures are now glazed, there is no longer risk of injury; in view, however, of the crowded state of the British School on students' days, and the large number of easels in use, the railings have been retained in that part of the National Gallery for the present as an additional protection.

A FEW attempts were made in London to hold exhibitions of architectural designs, but they always failed from lack of visitors. In New York a similar experiment is now being tried. It is to be hoped the promoters will not be called on to pay all the expenses. Some of the architectural journals have been discussing the subject. The *American Architect* maintains that nothing like the New York League Exhibition is known abroad, for in Europe architects trust to newspaper enterprise to make their works known. This, it says, is "particularly the case in England, where architectural periodicals like *The Builder* and *The Architect* have a very large circulation, and it is hardly too much to say that some of the greatest names in the profession in England have owed the most of their reputation to these two journals." And it is added that "the advantage to a practising architect in search of public reputation and employment, of being represented in the professional periodicals, whether he is represented in the exhibitions or not, is quite as great here (in America) as in England or France." *Architecture and Building*, as representing the art in New York, says:—"The League has become one of the things for the fashionable public to visit, and the afternoon or evening spent in the exhibition rooms makes a favourable impression and creates in a general way a taste for architectural art. But with the periodical, its weekly appearance at library or club affords opportunity for more careful study, criticism and discussion of works of public interest, than in the brief time of an exposition view is possible. While we say nothing against exhibitions, yet many of the drawings that have caught the public eye on their walls would be much better appreciated and more fully studied if afterwards they appeared in a periodical devoted to their interest. It is only short-sightedness that can fail to appreciate this." We are glad to hear that fashion does not object to an occasional saunter by the drawings in the League exhibition, and we hope the American example will be imitated this year in Burlington House. The architectural room is known only to fashion as a safe refuge from the crowd and young people to continue to enjoy the emotion which the French express by "Enfin! Seul!" on the cushioned seats that by this time must be full of delightful confidings. But the academicians should defray the cost of the drawings which keep the world at bay; it is rather hard on struggling architects that they must pay for a solitude which they cannot enjoy. In Paris, as in London, the architectural rooms are shunned by the public, and we imagine there is not one recorded case of a commission coming to an exhibitor from any drawings found on the walls.

IF the article in the *Fortnightly Review*, by Mr. SAMUEL HOWE, on "The Spoiling of St. Paul's," can be accepted as expressing American opinion, there is some amazement at what may be called the official silence in England about the perpetrations in progress within the cathedral. "Whatever," says the writer, "may be the final action of those in charge of St. Paul's Cathedral, the one opinion of English people here and in America is that the new decorations are a mistake; they conceal, and are fast eating up, the beauties of the church we all love. Yet the architects of England remain silent till now, and only whisper their opinions because of the important position the present decorator holds as member of a Royal Society, because of his value in the field of lecturing, and because of the rules of professional etiquette, requiring them to be loyal to him. What of their obligations to WREN, to the father of English Renaissance? Is his work to suffer because of the sentimental attitude of these gentlemen?" There is one excuse for the silence, and that is the immobility of the authorities. It cannot be expected that professional or public opinion will affect them, and the more audible is the remonstrance the greater appears the indifference. Mr. HOWE, we suppose, is an artist, and therefore may be justified in saying:—"The knowledge of those who devote a lifetime to the study of large decorative schemes involved in situations like the present qualifies them to note the practical value and experience of that life's work, and prompts them to shout out 'Stop!' before it is too late, before St. Paul's becomes a confusing medley of badly-devised painting and mosaics, the outcome of one of the gravest errors of the present time. This cry (adds the earnest critic) is more than a thought taken from the chaos of experience: it is a conclusion shared by thoughtful men throughout the intellectual world."

THE French proverb says, "Tout vient à point à qui sait attendre," and of its wisdom Mr. ASTON WEBB is an illustration. A short time ago all his most important prizes seemed doomed to vanish as if they were Dead Sea apples. The battle of the sites for the new Christ's Hospital was expected to close in putting an end to all the arrangements for the buildings. The completion of the South Kensington Museum was considered to mean a waste of public money in order to uphold a system that was handicapping English industries for the benefit of German competitors. When everything appeared to be hopeless for the architect there was a change. The schools near Horsham have sprung up as if by magic, and as seen from a railway carriage look as if they could shelter the bluecoat boys after the Easter holidays are over. The arrangements for the South Kensington buildings are advancing toward completion with less than the usual dilatoriness which is characteristic of Government enterprises. Then, as a further reward of patience, Mr. ASTON WEBB has carried off the coveted Associateship of the Academy, for which there were so many aspirants. So much success coming together is unusual with architects. That Mr. WEBB has been fortunate may be granted, but he has earned his reward. He has already produced excellent buildings, and as he loves his art there is no likelihood that he will grow indifferent through prosperity.

Chaumont.—Langres.

I LINGERED so long in Notre-Dame that there was no time to revisit the other churches with which the city of Châlons is richly stored. St. Jean, with its long, square-ended English-looking choir, I was especially sorry not to have had another peep at, but I knew that if I was to sleep at Langres the same evening, breaking the long journey at Chaumont for an hour, I must quit such a combination of attractions without further delay, for time and trains, French ones especially, are proverbially unaccommodating. So after a déjeuner à la fourchette in the buffet, the railway porters now and again putting their heads into it (the buffet, not the déjeuner), announcing the departure of trains for all sorts of delightful places, I was once more rushing through Champagne, with its apparently interminable plains, streaked here and there with chalky roads stretching away to bournes unknown. I caught glimpses of the Marne every now and then athwart the trees, and when the train ran into Joinville, whose beautiful First Pointed spire has been scraped and patched into smugness and smartness more tragic than utter ruin, I recalled the passage in one of Diderot's letters to Mdlle. Volland:—"Joinville, dont la Marne arrose le pied, fait un fort bel effet. C'est une bonne compagnie que cette rivière; vous la perdez; vous la retrouverez, pour la perdre encore; et toujours elle vous plaît; vous marchez entre elle et les plus beaux coteaux."

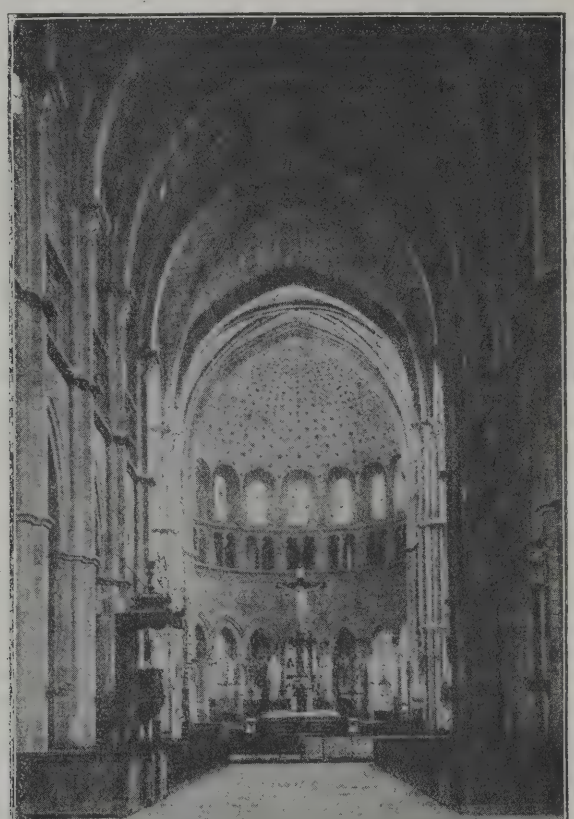
Chaumont has a delightful church, forming, as in hundreds of other French towns, the almost only object of interest. On leaving the railway station you walk through the regulation "place," with its cafés, &c, and along an "Avenue de la Gare" to a species of public garden formed on the edge of a plateau. Below, on a gentle slope, the town, with its straggling streets dominated by the parish church, its small twin slate-covered spires flanking an Early Pointed west front, lay basking in the afternoon sun. A somewhat abrupt descent to the right from this public garden leads into the hilly streets of the little town, and for a few minutes you lose sight of the spires; but they are close by, for presently, after some tortuous windings, you come upon the church's southern portal, at the delicacy of whose appearance, strongly recalling parts of St. Urbain at Troyes, it is quite impossible to refrain from rapturously exclaiming. Indeed, at first sight I took it for a most delicate piece of Middle Pointed wood carving. Its entrance is in three divisions. The central arch, which is widest, has eight cusps, and the fact of each cusp being, so to speak, subcusped, imparts more than ordinary richness to the composition. The side arches are narrower, but all are surmounted by triangles in lieu of the ordinary-shaped arches. The inner door, too, is exceedingly beautiful. Its arch, springing from four shafts, encloses in its tympanum a carving of the Baptism, with scenes from the life of "the Great Forerunner of the Morn" in a frieze below. Some graceful ringed shafts support the arch of the western door, whose tympanum is enriched with a conventional carving in wood of the Majesty within a vesica, and surrounded by the Evangelistic symbols. The large four-light window of this front is bricked up.

Internally, Chaumont Church presents an Early Pointed nave, extremely rich in detail, transepts and a Flamboyant choir of far inferior interest. The piers, slender round ones, coupled, but divided by the vaulting shafts, present very delicately chiselled capitals. There is no triforium, a blank space intervening between the tops of the arches and the single lancet-lighted clerestory. The great width of the aisles, from which Flamboyant chapels open out, is a remarkable feature.

In the otherwise uninteresting choir, of the poorest and thinnest Flamboyant, you see one of those attempts to excite attention by novelty which so often led to the corruption of taste, for when the last point of beauty had been attained, the next resource was the wonderful. I refer to the disproportioned corbels employed here in lieu of bosses, uncomfortable-looking things, hanging down and investing you with an idea that they ought to drop—an idea not a little difficult to escape. Instances of these pendant corbels occur in many Late Flamboyant churches of Normandy and Brittany. The eastern chapels of St. Pierre at Caen, interesting specimens of the early Renaissance, present examples of these ornaments. There is a considerable quantity of painted glass in the chapels opening out of the procession path in this church at Chaumont, but it is jejune, and has the general effect of the work which Mr. Wailes used to place in Middle and Third Pointed churches—work which did not call for or secure peculiar exertions on his part.

The pulpit, by Bouchardon père, displays such exquisitely carved foliage as to *faire venir l'eau à la bouche* (no joke is intended) of many an admirer of instrumenta ecclesiastica. By the same hand is the confronting banc d'œuvre, its canopy supported by four pillars of the Composite order. A Holy Sepulchre in one of the northern aisle chapels, with eleven coloured figures, is of Italian workmanship, and belongs to the middle of the fifteenth century, while the north transept presents a charming spiral staircase, one of those embellishments which architects of the earlier and better Flamboyant epoch frequently affected. I should mention that the church of Chaumont is dedicated to St. John the Baptist, ever, like St. Etienne, a very favourite appellation in France. Indeed, whenever a church bears the name of St. Jean it may be taken but rarely to be that of the Apostle.

Besides St. Jean, Chaumont possesses another church—one of those buildings in the Rococo style which Jesuitical influence sowed broadcast all over France during the seventeenth century. Rich in detail and picturesque in their ensembles, an inspection of two or three such structures is quite sufficient. I did not therefore regret the want of time which prevented my seeking the key of this one at Chaumont, which, as it belongs now to a Lycée, is not accessible to the general public.



Once again I was in the train and speeding on towards Langres, not sorry to come in sight of that airily-situated cathedral city about five o'clock. Another short railway journey, this time by the Chemin de Fer de Crémaillère (the only one in France, I believe), remained to be tried, so in company with the inevitable priest, a soldier and an old lady, I took a seat in one of the cars, open at the sides but covered on top like the Rheims tramways, and was soon whisked up the steep hill upon which Langres stands. A poodle, shaved in the most approved fashion, was of the party, comporting himself in a gentlemanly fashion. Putting his forepaws on to the ledge where in the ordinary course of things the window would be, he took a survey of the prospect, including a small circular erection surmounted by a statue of the Virgin, and raised to commemorate the non-occupation of the city by the Prussians during the war of 1870. Standing almost at the summit of the hill it forms a conspicuous object for miles round. A few minutes sufficed to land us at the top of the hill, where is perched a miniature railway station. Here a little omnibus was waiting.

The priest, unfurling his lettuce-like umbrella, puts it up, and trudges off; the old lady and the poodle get into the omnibus; the door is banged to; the poodle jumps on the seat and looks out at the window; I mount the box, and the vehicle is off, tearing round the cathedral and rattling along the "Grand Rue" of the quiet little city. The driver cracks his whip; Madame la Propriétaire emerges from the portal of the Hôtel de l'Europe; I descend; the customary *politesses* are exchanged; the omnibus drives off to deposit the old lady and the poodle at their destination, wherever it may be, and I am glad to wash off the dust and cinders of a long day's railway travel in a delightfully large and airy room, half salon, half *chambre à coucher*, whence, after a rest of half an hour or so, I emerge on a visit of inspection to the curiosities of Langres, whose situation next to that of Laon is, perhaps, one of the most delightful in France. For a long time I remain leaning over the parapet of the ramparts, surveying a magnificent expanse of sun-flooded champagne country until the Angelus from the cathedral tower breaks upon the ear, warning me that it is six o'clock and the hour of prayer.

Entering the cathedral I find its Southern-looking interior wearing a most picturesque look, with the now declining sun throwing its remaining strength through a large unstained window behind the organ upon the great silver Calvary behind the high altar, and upon the neat white caps of some thirty old

bourgeoises, scattered here and there in the quaint straight-backed and, in some cases, closed pews which line the broad, Classic-looking nave on either side. They are awaiting the commencement of the simple evening prayers, which here, as elsewhere—being recited in the vernacular—are largely attended by the humble classes. I remember attending one of these *prières du soïr* in the little old fishermen's church at the seaport town of St. Valery-en-Caux on the Normandy coast. Dimly lighted here and there with a few candles, which flickered on the rough weather-beaten faces of the old fisher folk as their lips moved in response to the priest, the scene in the rude old building was one for a painter.

The bell has ceased to toll along the roof, a couple of cantors instal themselves in the choir behind the high altar, a priest ascends the richly-carved nave pulpit, and anon a low murmuring arises from the old bourgeoises. They are reciting the Office of the Rosary. Prayers and responses follow; then comes Benediction. Incense rises in a column before the great silver Christ behind the altar; "Tantum Ergo" is sung by the cantors and heartily joined in by the old people; the Host is borne out through the gate at the east end of the choir to the lady-altar, and I pace the solemn procession path with the hymn just sung ringing in my ears and haunting me as

Interior of the Cathedral, Langres.

only unaccompanied plain-song music can; the old white-capped, neatly-shawled dames leave the building one by one for *ménages* where doubtless savoury messes of *potage* have been meanwhile simmering for the evening meal.

A stroll along the western ramparts of the city and a dive up a few quaint streets bring me to a cavernous-looking but picturesque church—St. Martin. Here a raucous-voiced priest is going through the "Stations of the Cross," attended by three little choristers in girded albs, one of them acting as crucifer. They make their responses in a somewhat vague and uncertain fashion, by no means coming up to time with the verses of the "Stabat Mater." Evidently my presence tends somewhat *pour les distraire*, for the priest, doubtless regarding me as the originator of this nonchalance, turns about and for a short space looks rather irate; so I deem it prudent to beat a hasty retreat, and leave ecclesiological gleanings from this happy hunting-ground to be gathered up at a more favourable opportunity.

The cathedral of Langres, dedicated to St. Mammès, although deficient in the vastness and height characteristic of the great Northern French churches, is extremely pleasing from its simple, solemn grandeur. It is, for the most part, a copy of Autun Cathedral, and, like that structure, is an example of the long-perpetuated influence of Roman architecture, which throughout the province of Lyons is more or less observable in buildings of the twelfth and thirteenth centuries. But of this peculiarity I hope to speak more fully anon.

It was in this cathedral of Langres that I made acquaintance with the Southern type of French Gothic work. Its chief difference, arising doubtless from influence of climate, is observable in the simple barrel-vaulted roof, the smallness of the windows, and the generally speluncar aspect of the building, which to my mind presents an effect of far greater solemnity than the immense lantern-like structures of the North, where, unless the windows are filled with Mediæval glass, as at Chartres and Bourges, it is difficult to produce the same result.

The nave, of great width, is separated from its aisles by pointed arches which rise from fluted pilasters of the Corinthian order. A similar pilaster runs up the centre of each pier on the nave side supporting the main ribs of the simply barrel-vaulted roof. Above each bay is a low triforium of three round-headed arcades, with a Corinthian pilaster between each, while the clerestory is lighted by single round-headed windows of the customary Romanesque form. The aisles are similarly fenestrated. Westward the nave terminates in an organ gallery supported on two tall Corinthian pillars. A work of the Renaissance (1555), it harmonises admirably with the style of the cathedral, and in its outline recalls the division between the nave and chancel in Hawksmoor's massive Christ Church, Spitalfields. Beneath this screen is formed a spacious vestibule or narthex, which, together with the whole of the western façade —flanked by small towers, recalling St. Sulpice—is in the miserably Italianised Grecian style of 1761-68. The north nave aisle has several points of interest. At its west end a very beautiful door of latest and richest Romanesque, but with again the introduction of Classic detail as evinced by Corinthian pilasters, opens into the above-mentioned vestibule. From this doorway the view down the aisle is one of great beauty and impressiveness; equally fine are the views across the nave. In the north wall of the same aisle a grilled archway opens into a large chapel of very ornate Palladian character, having a richly-camerated roof, and a most elaborate coeval tesselated pavement. Except for the font, this chapel is devoid of furniture, the footpace for the altar, however, is to be seen on the east side. Next to this baptistery door is the shrine of St. Regne, whose image stands niched between two Corinthian pillars. On either side is an elongated panel with sculpture from the life of Christ. This is quite a little gem of the Renaissance. Passing from the aisle into the north transept the noble simplicity of this cathedral at Langres makes itself felt more and more. Here the detail is richer, a very highly elaborated string of moulding being carried round the arches opening into both nave and choir aisles, as well as beneath the triforium stage, which, similar in character to that of the nave, is repeated on the north and south walls of each transept beneath a large round window with six plate-traceried foliations. The effigy of Monseigneur Guerrin, Bishop of Langres (1852-77), kneeling upon a black marble sarcophagus, bears a considerable share in imparting solemnity to this transept. The basilican arrangement prevails here, the sanctuary being formed beneath the great crux, devoid, however, as in most Southern French examples, of a central tower. The high altar—very simple and Classical—stands under the arch opening into the eastern limb, where are placed the accompaniment organ and choir-stalls. Behind the high altar is a lofty crucifix in wood and silver, a copy of the celebrated one attributed to the sixteenth-century artist Gentil in the neighbouring church of St. Martin. Its attendant figures are in silver, and the whole work, from its size, has a very imposing appearance from the west end of the cathedral. Tall iron grilles and gates screen off the transept and choir aisles from the sanctuary; against those on the north the episcopal throne is reared.

The eastern limb is short, consisting only of one bay beside the apse. This bay, of similar character to those in the nave (only, like those in the transepts, more richly detailed), dates, as does the greater part of the cathedral, from the first half of the thirteenth century. It is, in fact, a copy, as I mentioned above

n a somewhat broader scale, of the cathedral at Autun, which as commenced towards the close of the eleventh century and onsecrated in 1132, nearly a century before the erection of the ave and transepts at Langres, whose oldest part is its apse. his, dating from the second half of the twelfth century, opens nto the procession path by nine massive arches on monolithic olumns of pink marble with Corinthian capitals. A very rich noulding is carried round each arch, where in the later Northern othic a dripstone would be looked for. A blank wall space ipervenes; then we have a triforium of small arcades in pairs, ith a Corinthian pilaster between each pair, and a clerestory simple round-headed windows filled with modern stained-ass, the subjects being single figures very archaically treated. he apse roof, a very simple one, unribbed, exclaims for a inting of the Majesty on a dignified scale. At present its nch is merely powdered with stars.

I had almost forgotten the very beautiful window which Early iddle Pointed art, for the purpose of admitting more light is inserted above the first bay of the eastern limb on either le. Of the three lights composing these windows the central ne runs up into the head of the arch, somewhat after the fashion the noble west window of All Saints, Margaret Street; the le lights are lower, and are surmounted by inverted trefoils. xcellent modern stained-glass, representing full-length figures saints and bishops, with blue backgrounds balanced by silvery-ey work in the canopies, fills these windows. Except the baptis-ry and the very poor Middle Pointed chapels radiating from the ocession path, these windows appeared to be the only complete othic work visible in the cathedral, which is much more fortunate this respect than its parent Autun, whose aisles have been uch disturbed by the projection of Flamboyant chapels, cellent, however, of their kind, and whose original choir has sappeared. Two beautiful doors in the south choir aisle of angres, one in Late Pointed and square-headed, the other ch Romanesque, challenged my attention from their curious xtaposition; but perhaps the feature that struck me most ere—leaving out of the question the employment of Corinthian lasters and details in a thirteenth-century building—was the nple sexfoiled and plate-traceried round window lighting the incipal face of either transept. Admirable examples of imita-on, these roses quite fascinated me.

I spent the whole of Saturday (July 28) in this quiet old thedral city. Out by six I have, while the day is young, mpletely lionised it. I have concluded my notes on St. ammés and St. Martin; I have made the circuit of its ram-rts, getting views of an immense tract of sunlit country own below from every point; I have mingled in the busy rong of the market; I have strolled, book in hand, and down its ideal Promenade de la Blanche Fontaine, a ly fine avenue of trees recalling the Broad Walk at Oxford; have "assisted" at the morning chapter offices, and now, wards eleven o'clock, it being too hot for any outdoor exercise, seek the hotel and the shade of its salon. The few sounds at penetrate here to break the summer stillness are pleasant unds—horticultural ones from the garden, where bees are mming; culinary ones from the kitchen, where Monsieur le oq and his subordinates are actively engaged in the prepara-on of déjeuner. I look about me for writing materials, discern resently a skewer-like pen and a frivolous-looking little inkpot aped like an apple; paper I luckily have with me; so with ese implements—*pour passer le temps*—I scratch away until e hour of déjeuner at "A Short Account of Church Architecture France," inspired, I suppose, by the locale.

(*To be continued.*)

THE APPRENTICESHIP QUESTION.

THE following evidence was given by Mr. Holloway and Mr. Colls before the special sub-committee on the Build-g Trades of the London County Council:—

Mr. Henry Holloway, of the firm of Messrs. Holloway rothers, said that with regard to the apprenticeship in the ilding trades there had been a great decline in recent years. his applied to all branches, but perhaps less in the case of iners than others. The reason for this decline was the difference on the part of employers, who were of opinion that prentices did not pay, and who could not tolerate the trouble id inconvenience caused by unruly apprentices. The result this decline had been the lowering of the standard of skilled mechanics and a difficulty in securing good foremen. At his firm there were apprentices in all the branches of the trade except painters, and it was noticed that these apprentices turned out to be the best workmen. In all cases except that of plastering the applicants for apprenticeships were plentiful. The premiums charged varied from 5*l*, but, generally speaking, were between 20*l*. and 25*l*. where the apprentices were able to get assistance from charitable funds. In order to surmount the difficulty regarding the unruly apprentices, the firm had a clause in most of the indentures to the effect that if the apprentices gave satisfaction and made good progress at the end of the term of apprenticeship the sum of 5*l*. would be paid to them as a gift. This was the only check upon them. The wages paid to apprentices varied from 5*s*. or 6*s*. a week, rising to 18*s*. or 20*s*. a week. The present term of apprentice-ship was from five to six years, but in some trades this might very well be reduced to four years, more particularly in the bricklaying and plastering trades. There was a clause in the indentures to the effect that apprentices should attend technical classes under the Science and Art Department, South Kensington; and in some cases where the apprentices attended day classes, the time they spent at the classes was treated as part of their time in the workshop. These technical classes could not in any way be considered to supersede apprenticeship; they could greatly assist the apprentices, but could not take the place of apprenticeship. The reason for this was that in the classes the work was looked upon to a great extent by the pupils as so much recreation, and had not the practical bearing upon the ordinary work of the apprentice. In addition, they did not get the practical instruction in these classes that they would get by working with workmen in the workshop. The kind of instruction necessary was the practical plane and solid geometry, drawing and building construction, the use and nature of various kinds of materials, illustrations with models on a reduced scale of the construction of roofs and trusses, and also the testing and carrying powers of arches and trusses both in steel and iron, as well as in stone or brickwork. This instruction was necessary in order to train boys to become foremen eventually, and apparently from inquiries made it appeared that this instruction was given in technical classes. In his opinion, there was not sufficient care taken in the selection of teachers; the best instruction possible should be given. Instead of simply taking ordinary mechanics as teachers, it would be well, as far as possible, to secure the services of good foremen. If these men could not be obtained to give their whole time, their services should be secured as occasional or consulting teachers or visitors, and as assistants less qualified men could be secured. As an instance of the type of men at present engaged as instructors, the following example was given. One young man, employed at the firm in the capacity of joiner's improver, proved to be of very little use, and, being apparently incapable of learning the trade, the foreman told him to look out for employment elsewhere. This man subsequently got a position as instructor at one of the technical classes. It is very important that the staff should be very carefully selected. More regard might be paid to the appointment of the governors of the schools. Take, for instance, Battersea Polytechnic; with the exception of Mr. Davies, there was scarcely a practical man upon the governing body. Each industry should, as far as possible, be represented upon the governing body by a practical man and bring the institutions directly into touch with the trades. Joiners' apprentices should be taught to set out their work and work from the rod and from drawings; at present they were taught to make doors and other simple pieces of joinery of that character. Of the men now engaged in the building trades probably not more than one in ten had served an apprenticeship. A large proportion of the men had learned their trade in the country. The unemployed mechanics at the present time were generally speaking inferior workmen, and this was the cause of so many mechanics having irregular employment. The London boys did not take up the building trades so much as those in the country. With regard to meeting the difficulty of apprenticeship it would be a good idea if a central authority efficiently equipped with funds could be instituted to deal with both apprentices and their education. This, he believed, had been started in America and worked satisfactorily. This central body should be a composite body consisting of representatives of architects, builders and em-ployées, and this might lead to the creation of district trade schools. In Philadelphia the mechanics were trained at what is called a building exchange. At this exchange there were large workshops where youths were taught the trade under the supervision of skilled instructors. The apprentices entered at seventeen or eighteen years of age and remained about three years. In that time it was calculated that this exchange could turn out skilled men. The exchange was maintained by the building trades. The apprentices there did actual work which was supplied to the trades. The central authority suggested would make arrangements for employers to take a number of apprentices and would be responsible for the payment of the premiums. The difficulty with apprentices at present was that

they did not pay the employers; the apprentices were not satisfied unless they started at a high wage. At present the amount was 5*s.* or 6*s.* a week, but in the near future the amount would have to be increased to 7*s.* or 8*s.* a week.

In replying to a question as to whether it was not a fact that the securing of apprentices in the plastering trade was hampered by the trades union, Mr. Holloway thought it probable that the action of the trades union might have some effect on the boys taking up plastering work. The apprentices were greatly restricted as regards their age at commencing, and great pressure was brought upon apprentices to enter the union immediately on entering their term of apprenticeship, which was a disadvantage. There used to be a greater number of apprentices to the plastering trade, but Mr. Holloway could not say that the diminution was caused by the action of the trades union. To a certain extent the instruction in the technical classes would be the same for apprentices as that given to clerks in drawing offices. With regard to the fees to be charged, a reasonable fee should be charged to ordinary students and a reduced fee to apprentices. It was impossible to make apprentices in receipt of 6*s.* or 7*s.* a week pay the employer because machinery now did much of the work formerly performed by apprentices. Under the old system a joiner's apprentice would for two years act as a "handy boy" about the shop and do odd jobs. At the present time the apprentice was taught much more, but it was necessary first to teach him the use of tools. Mr. Holloway had personally visited the trade classes for apprentices and admitted that he did not attach much importance to the practical instruction therein given. It was more important that scientific and theoretical instruction should be given. The practical instruction could only be satisfactorily obtained in the workshop. The only kind of practical instruction necessary in an institution was that which would be imparted by the use of models to illustrate the theoretical instruction. This remark applied to all branches of the building trade. With regard to the small number of apprentices at Cubitt's, Mr. Holloway pointed out that in all probability it was due to the cost of training them, and the only remedy was to be found in offering the employer special inducements. The central authority would, to a great extent, overcome the difficulty, and would see that apprentices were thoroughly taught the trade. Whatever action the Technical Education Board might take with regard to granting funds, it was important to provide that the apprentices should learn the whole trade and not part of it, as in some cases at present. Notwithstanding the premiums the apprentices did not pay. In some cases it was possible to get as much as £50, but some scheme might be arranged by which apprentices should refund a portion of the premium advanced by the central authority during the last year of apprenticeship, and afterwards undertake to repay a certain proportion in instalments. There were more applications for apprenticeships than the firm could entertain, except in plastering, but there were not many who could pay the premiums. The firm had, however, been fortunate in getting some apprentices whose premiums had been paid by means of charitable funds. The only way to induce the apprentices to attend classes was to approach all the charities and trustees of funds used for apprenticeship, and get them to make a condition that all apprentices must attend evening classes. If the employers were asked, it would in all probability be possible to get some time off for the apprentices, possibly at four o'clock, on condition that they attended evening classes. Some of the apprentices at the firm attended classes twice a week. They left work at two, and the classes commenced at three o'clock. As regards asking the employers to grant some facility to the apprentices attending classes, it would be received favourably by some, if not all. With regard to the sons of builders and of young men who desired to become masters, it would be of little use providing day schools for them; they preferred being at work on buildings. Young men with capital, for instance, desirous of becoming master-builders, would first get instruction in the office, and then go as assistant foremen. At the same time they attended evening classes as artisans. The building trade was somewhat different from the engineering trade, because the scientific and theoretical part was done by the architect. What was necessary on the part of the builders was a practical knowledge.

Mr. Holloway thought, as a commencing age, the apprentice should be between sixteen and seventeen. The sons of mechanics did not stay at school until apprenticed, but got employment in offices or in tradesmen's shops. In no case should the term of apprenticeship terminate under twenty years of age. A large proportion of the sons of London mechanics went into City offices, which pointed to the fact that the mechanic tried to improve the status of his family. There were not sufficient posts to enable builders to employ all mechanics' sons as apprentices. It had been noticed that the majority of apprentices were the sons of warehousemen, clerks and tradespeople. Few bricklayers had served an apprenticeship; consequently only a small percentage of the bricklayers could do good face work, and properly understand sanitary work. Apprentices in nearly all cases turned out to be the best men, probably through the discipline in training. One reason why the time of apprentices could be reduced to four years was because machinery now did much of the work performed by apprentices in the first year or two of their apprenticeship. The plasterers, for instance, used to cast their own moulding, whereas now it was done by specialists and supplied to the builders. The work now to be done by apprentices was too heavy for youths under sixteen years of age, and in the bricklaying trade especially, it was undesirable to start earlier. In training men to become foremen, drawing should form one of the subjects. Everyone should have the opportunity of becoming a foreman. There would be no need for any preliminary examinations, as the employers could readily accept the men who were the most suitable. The sons of London mechanics did not as a rule descend in the world. The reason why apprentices were taken by the firm, although they did not pay, was because of the desire on the part of the firm to get good mechanics. The men usually remained in the firm's employment, and they afterwards compensated for the trouble bestowed upon them during apprenticeship. In cases where apprentices had not the opportunity of getting aid from charitable funds the premium charged was 5*l.*, otherwise 20*l.* or 25*l.*, the premiums being paid in two instalments. With respect to the central authority which had previously been mentioned to deal with funds for apprenticeship, the funds for this purpose would probably come from the guilds of London and other charities, and would be distributed by the central authority, which would act as an intermediary between the employers and apprentices. The trustees of these charitable funds did not take personal interest in the apprentices so far as had been noticed by the firm. The institution of a central authority would mean simply the consolidation of the existing funds so as to be distributed by one authority which should include members of the trustees, employers and associations. The apprentices should be induced as far as possible to take full benefit of the opportunities afforded by classes. As to whether in the teaching of the geometry of staircase work, &c., the illustrations should be made on a blackboard only, there were occasions when it might be an advantage to give practical instruction. As a rule the apprentices did not derive much benefit from the practical instruction given in the polytechnics. With regard to a painter it would be almost a waste of time to teach him anything, as the higher class of painting came under the designation of "decoration," and was, strictly speaking, an art. The mixing of colours was generally done by a man who had a special aptitude for the work. A builder's foreman should be capable of testing the construction of roofs and arches. It would be an advantage to establish a day continuation school without attempting to teach the practical work. The teaching should be directed to suit their future employment. It would be also a great advantage to teach such subjects as workshop arithmetic, drawing, experimental mechanics, experimental physics and the manual instruction in the use of tools, although it would then be found that instead of the pupils becoming apprentices as desired they would like to get into architects' offices. Some men, unfortunately, did not learn thoroughly the trade, but only one branch of it, and Mr. Holloway could not definitely say that by attending classes to enable them to learn other branches they would be much benefited by the instruction. In all probability they would not reach the standard of efficiency acquired by apprenticeship in all the branches. It would be better for them if they could learn the theoretical part of the work at the institution and then go to learn the practical work at the workshops. In the case of apprentices to the upholstery trade some of them only learnt one branch, and as it did not apply to the building trades Mr. Holloway could not express any definite opinion on the question. When men in the building trade had not been apprenticed and had only learned one branch of the trade it might be an advantage for them to get instruction in evening classes, which would improve them. It was better to have all men trained practically; they then took an interest in their work. This also applied to the sons of builders. It was necessary for them to have a practical knowledge of the trade; the theoretical knowledge was left to the architect. The foremen in many cases pointed out practical difficulties to the architects. Plasterers should be allowed to commence their apprenticeship after 16 to 18 years of age. The Plasterers' Association insisted on apprentices commencing not later than seventeen years of age. The object of the plasterers in so doing was to limit the number of plasterers. No other trade union imposed such a restriction as far as he knew. Where men in the building trade had not been apprenticed and had only learned one branch of the trade, it might be an advantage for them to get instruction in evening classes, which should improve them. It was better to have all men trained practically at works. This also applied to the sons of builders. It was necessary for them to have a practical knowledge of the trade; the theoretical knowledge was left to the architect. The limitations upon apprentices were confined to the Plasterers'

sociation, and through the apprentices being apprenticed at ut fourteen years of age they came out of their time at nteen to nineteen years of age; they should be allowed to mence their apprenticeship later in life. In many branches he building trades the work was too hard for apprentices of teen years of age, and this being the case some of the boys ferred clerkships or tradesmen's assistants.

Mr. Howard Colls.

Mr. Howard Colls, of the firm of Messrs. Colls & Sons, l that the training given in the polytechnics was very good, it must be understood that they could not turn out men as led tradesmen. The training of boys at polytechnics uld not take up their whole time; they should have prac- l work during the daytime. Years ago fathers used to e their boys on buildings or in shops and teach them trades. e regulations now employed by unions did not allow boys to k on scaffolds. These restrictions tended to diminish the ply. The restrictions were more severe with regard to the sterers than any other trades. At present these were in his two apprentices to bricklaying, and a good many boys to carpentry and joinery. Every inducement by means of bills notices was given to the boys and improvers to attend ses. Mr. Colls said he had visited some of the polytechnics, had been an examiner for the Carpenters' Company. The k at the Great Titchfield Street Trades School was very d. The kind of work young men who were engaged all day uired was a theoretical knowledge of the setting out. It was necessary to aim at making every workman able to set out. best men who could take the lead should be taught wing and building construction at evening classes. There e several levels of skill in the different branches, more cially among carpenters. The technical workshop was means of attracting men to classes, but when used as a ducing shop was valueless. Generally speaking carpenters e better able to read drawings than bricklayers, and they made better foremen of works, which pointed to the fact t drawing was a good subject to teach bricklayers. Brick- ers might, however, be good men without being able to d drawings. Carpentry was a more highly skilled trade n bricklaying, except in some of the higher developments, h as groining, &c. Carpenters had more opportunity of oming foremen as they invariably remained from the begin- g to the end of a large piece of work, whereas brick- ers were constantly changed. A carpenter was able set out a bricklayer's work, but nine out of ten brick- ers never looked at a drawing. The carpenter was a erior kind of workman and had a better chance of becoming aster. The paucity of bricklayers was partly due to the les union having much objection to boys working on ffolds. Several apprentices were kept in the shop. This on of the union was to limit the number of workmen. hough there were different grades of workmen, it was com- ory on the masters to pay all the men the same standard e and not differentiate according to skill, but a good man seldom out of employment. The master plasterers used to men more than ordinary trades union wages, but they were almost extinct. The builders did their own plastering, except fibrous work, which was sublet. The reason of this extra e was because the men did a good day's work. The stering now done by the builders was as good as that done the master plasterers, but cost a great deal more. In times t there were apprentices in the plastering trade, but sterers could easily be recruited from the plasterers' ourers. A boy of seventeen or eighteen could start with ings; it was not too heavy work. The Plasterers' Union uld not allow young plasterers to assist the men, but uired labourers who were not able to become plasterers. rs ago the work was done by the piece, and it was then an antage for a man to have his son to assist him. The inten- of the boys was to become plasterers. The building trade not so intricate as engineering; many of the difficult blems were solved by the architect, whereas the engineer to carry the work through alone. The builder should be to tell by experience if everything was going right. Under contract the builder would in all probability be legally onsible for the efficiency of the work carried out. With ard to an apprenticeship school, it might be a good experi- t to try one, but it would be very costly. A very large ool would be required where work could be built up and ed down. There was no difficulty in getting good nbers. The men attended classes with the idea of g in for certain examinations which act as a great icement. With regard to the other branches of the ding trades there was a paucity of men, and the standard not so good as formerly. This was the result of the rease of the apprenticeship system. Boys of seventeen uld be taught in the evening and work at the trade during day. There was no reason why an intelligent labourer uld not make a good bricklayer. Much woodwork that l to be done entirely by hand was now done by machinery, and the workman only joins it together. The work done in this way was as good as formerly, in some cases, perhaps, better. The price of brickwork had increased, but in many cases the work was better done. There was a large extra cost, chiefly owing to the fact that men did much less work, but the wages at the same time had also increased. The brickwork done now was better than ever it had been, the best of materials being used. There was danger of the men falling off unless we aim at teaching the young men. The average bricklayer only worked about forty-eight weeks in the year. They were not allowed to make up this lost time unless they were paid overtime rate. For instance, if a man left at three o'clock instead of five in consequence of rain, the trades union would not allow him to work till seven another night unless he was paid overtime. There was not so much overtime worked now as formerly. The overtime was now confined to special work which must be finished in a short time. In the country the men frequently at their own request worked overtime. Mr. Colls said he was a member of the Carpenters' Company, but not in any way connected with a polytechnic. The best way to teach the workmen the trade was to let them work in the daytime on the scaffold, and in the evening attend classes where only theoretical instruction fully illustrated was given. It should not be the intention of the authorities of the polytechnic to try to turn out finished workmen; it was their duty to supplement the training on the scaffolds by theoretical teaching. Perhaps twenty of the men engaged at his works were improvers under twenty-one years of age. A great many bricklayers' labourers ultimately, especially in the country, became bricklayers. These labourers should certainly be admitted to classes, and there should be no objection raised. If it were made a rule to admit everyone, whether builders' clerks or labourers, it should also be in the power of the authorities to turn away those men who did not show any promise. The regulations in force at the polytechnics were such that only apprentices or improvers were allowed to attend the classes. This accounted for the paucity of students in the various trades classes. It was noted that there were many students attending building construction classes. While it was necessary for men to have theoretical training to be able to make them more efficient, there were plenty of very good carpenters and other men who had had no theoretical training. There were only one or two apprentices or improvers to the bricklaying trade at the works, and therefore, as only bricklayers or apprentices could attend classes, the number at the classes was very small. The bricklayers attended classes with the intention of learning brickcutting. The object in limiting the number of workmen at classes was to decrease the number in their trade so as to make work last longer. Thirteen years of age was too young for boys to go as apprentices. This was also a drawback to apprenticeship. It might be an advantage if a boy of thirteen after leaving school were to join a polytechnic for two years and learn to manipulate the tools, especially carpentry tools. In all the branches of the building trades the use of woodworking tools would be the best. The two years' teaching should include a certain amount of geometry and building construction. A great many sons of bricklayers and artisans get into small shops where they learn the trades. They frequently follow the trade of their father. At the works it was principally the sons of workmen engaged on the premises who were allowed to be apprenticed. There was not much difficulty with the Carpenters' Union in allowing apprentices. There were about seventy or eighty joiners employed at the works, which largely exceeded the number of carpenters. The terms on which apprentices being sons of workmen were sometimes taken at the works were as follows:—A boy was taken about fourteen or fifteen years of age for about five years, no premium being required, and his wages were for the first year 2*s.* 6*d.*, second year 5*s*, third year 7*s.* 6*d*, fourth year 10*s.*, and if satisfactory during the last year 1*l.* per week. Mr. Colls considered that the Board was doing good work in getting men to attend evening classes, but institutions should not aim at turning out men from the classes without doing practical work at works.

THE SCOTTISH ARCHÆOLOGICAL PUZZLE.

IN his second communication to the *Glasgow Herald* on the discoveries at Dumbuck and Dumbowie, Dr. David Murray writes:—About thirty ancient canoes have at various times been found in and near the Clyde. The first was got when the foundation of St. Enoch Church was being dug in 1780. It lay at a depth of 25 feet from the surface, and inside it was an almond-shaped polished celt of a dark green colour. When the widening of the Clyde below the Broomielaw commenced about 1846, five canoes were found on the lands of Springfield, on the south side of the river, five at Clydehaugh, immediately to the west of Springfield; an eleventh on the adjoining lands of Bankton, and a twelfth at Pointhouse, on the north bank.

The average depth at which they lay was 19 feet from the surface, and mostly at a considerable distance from the margin of the river. All of them were embedded in stratified sand. With one exception, they had been hollowed out of oak trees, some more, some less, skilfully. The Bankton canoe, on the other hand, was clinker built; the boards had been fastened to the ribs partly by oaken pins and partly by metal nails, although none of the latter remained. One of the Springfield group had a plug of cork, and one of the Clydehaugh group rested on a thin piece of lead, perforated with nail holes. In 1855 a canoe, 33 feet long, 4 feet broad and 3½ feet deep was found at Erskine Ferry; and in 1863 two were found near the ferry at Renfrew, at a depth of 14 feet, in sandy gravel. In June 1863 two more were discovered in the soil in the bend of the river eastward from Dunglass Castle. Two men who had seen in the newspapers the account of the discovery of these canoes recollected that they had observed a piece of timber projecting from the soil on the shore near Milton Isle, and resolved to dig it out in case it might turn out to be another canoe. In August they unearthed a canoe 22 feet long and 2 feet 10 inches broad. In the bottom were several holes fully 2 inches in diameter, and at about equal distances from bow to stern. Lying on the floor were two stone celts, a larger and a smaller one, a considerable piece of deer's horn, a wooden club and a large irregularly-shaped stone "not unlike a petrified tortoise." About 1878 a portion of a canoe, the horns of red deer and the vertebræ and caudal bones of a whale were got on the Finlayston bank below Bowling. In the spring of 1855 a part of the dorsal vertebræ of a whale was dredged up on the south side of the river a little above Erskine Ferry. In 1879 the remains of a canoe were found in the bed of the river, just below Rutherglen Bridge, and next year another was found in the bed of the river a little further down, on the site of what used to be known as the Point Isle, nearly opposite Nelson's Monument.

The Dumbuck canoe was found in a situation very similar to the one found at Milton Isle, about 1,000 yards to the east. It is, however, much longer, and is indeed one of the longest, if not the longest, found in Scotland. The Erskine Ferry one was 33 feet in length, and one found in 1726 near the mouth of the Carron was 36 feet long, 4½ feet broad and 4 feet deep. The Dumbuck specimen is still 33 feet long; about 2 feet were broken off after it was unearthed, but even then it was imperfect and was probably fully 37 feet long when complete.

Other Clyde Finds.

Various other objects have from time to time been found in the Clyde and in the Clyde drift which throw light upon those found at Dumbuck. At a meeting of the Archæological Society of Glasgow in 1895 I described a number of perforated stones found in the bed of the river near Rutherglen Bridge. These, I have no doubt, were net or line sinkers, but I incline to think that they were comparatively modern. Similar stones of undoubtedly ancient date have, however, likewise been found.

When the excavation of Windmillcroft was being carried on for the construction of Kingston Dock, Mr. James Bennie found in the river drift, at a depth of about 15 feet from the surface, (1) a circlet of splint coal, weighing 6½ oz., 3½ inches in diameter, with perforation of 1½ inches; (2) a circlet of bituminous shale, weighing 16½ oz., 5½ inches in diameter, with perforation 1½ inches; (3) an oblong square of bituminous shale, weighing 14 oz., with perforation 2 inches; (4) an oblong perforated pebble, weighing 14½ oz.; (5) a circlet of iron, neatly made by an adept in handling metals, weighing 8 oz., 1¾ inches in diameter, with perforation of ¼ inch; (6) a pebble, weighing 8 oz., with groove all round it; (7) an oblong block of sandstone, weighing 58 lbs., ground all round, apparently an anchor stone; (8) several pieces of wood not unlike a boy's hat, similar to the short paddles found with some of the Irish canoes, and a piece of bent wood like the letter S; (9) a perforated stone sinker, weighing 22 oz. A stone celt was also found during the excavations. Two sinkers identical to No. 9 were found by Mr. Fraser Christie in the bed of the Clyde at Westhorn, which Mr. Bennie thinks were washed out of some old gravel bed of the river. A circular stone, 4⅛ inches in diameter, with a groove round the edge, was found in a deposit of sand near the Clyde at Belvidere. When the foundations of the great cone of the old bottle works at the foot of Jamaica Street were being dug in 1730 two querns were found. When the water filters at Cuningar were put in in 1839 a vase was found 16 feet beneath the surface, 150 feet from the margin of the Clyde. A stone celt was found in the bed of the river at Rutherglen Bridge in 1854, another and a flint arrow-head in 1875 in the excavation for the Queen's Dock. A bronze socketed celt was found at York Street Ferry in 1864. A denarius of the Emperor Constantine II. and other coins and medals, a stone cross and various other objects were dug from the channel of the Clyde near Govan before 1856. A Roman coin was found in Clyde Street, Bridgeton, in 1892, about 25 feet below the surface. A Roman bowl of red-glazed Samian ware was found in 1876 in the Provost's Haugh, about 4½ feet under the present surface of the Green and about 200 feet from the Clyde. A small urn of baked clay was found in a deposit of sand when digging the foundation of a building at Springfield Quay. A font-like vessel of stone was got in the workings during the formation of the Harbour Tunnel in 1891. A cranium of the "Bos primigenius" and a horn of the reindeer were found in 1833, when operations were in progress in the alluvium of the Clyde, on the Kelvin. When the sewer was being formed in Greendyke Street, near the north-west corner of Glasgow Green, there were found a horn of the "Bos primigenius" and a rib apparently of the reindeer, but at what depth has not been recorded.

Results of this Evidence.

The finds in St. Enoch Square, at the foot of Jamaica Street, at Springfield, Clydehaugh, Bankton and Pointhouse may be taken to be all on the same horizon. They prove, I think, that the men of that period had canoes of various degrees of finish, from the dug-out to the clinker-built boat, that they were fishers and had nets and lines, that they used stone celts, that they were likewise acquainted with the use of iron and lead, and were skilful smiths, and that they were accustomed to shape and use cannel coal. This would indicate that their epoch was about the Roman period; but, if we take into account the bowl of Samian ware, which must, I think, be held to be a contemporaneous deposit, this brings the date down somewhat later, and the evidence of the clinker-built boat points in the same direction. A dug-out canoe is not necessarily old; a clinker-built implies the use of metal, and most probably of iron tools. The canoes on the lower reaches of the Clyde, it would be safe to conclude, are not older than the Glasgow group above mentioned, and may be later. The presence of the horns of the reindeer and of "Bos primigenius" does not militate against this conjecture, as the latter seems to have been living in Scotland as late, at least, as the Roman period, and the reindeer outlived it. If any of the antlers found at Dumbuck are those of the fallow-deer, as the explorers state they are, this proves that the bone heap cannot be earlier than the Roman period, and may be much later. M. Lartet believes that the fallow-deer was introduced into France by the Romans, and as regards Great Britain, Professor Boyd-Dawkins says:—"It may be assumed, with a very high degree of probability, that we are indebted to the Romans for the introduction of the southern form, the fallow-deer (Cervus dama) of our parks" ("International Congress of Prehistoric Archæology, 1868," p. 286; see also "Congress of 1867, Paris," p. 315). Flat perforated stones and shale discs belong to all periods, but being found at Dumbuck associated with a bone heap are, no doubt, of the same date as the bones.

The canoe being found along with the other objects suggests that they were contemporaneous deposits, but this does not necessarily follow. One of the questions to be determined by a careful examination of the site is whether the canoe was in its original position when dug up. For instance, it may have been washed out of the silt higher up the river and drifted to the present spot and re-embedded. In that case it would be no guide to the age of the other objects. If, on the other hand, the canoe is in its original position, as the explorers think is the case, there is a strong presumption that the submarine structure belongs to the same period as the canoe, and that the ornamented objects are contemporaneous.

There is no reliable information at present available for forming a final or reliable conclusion, but the antiquity of the objects, taken as a whole, might in any case, I think, be greater than the early centuries of the Christian era.

Allusion has more than once been made to the report of some remarks I made at the meeting of the Glasgow Archæological Society upon January 19, as meaning that in my opinion the objects in question might be neolithic. This is not so. I said that, so far as I could judge, they belonged to somewhere about the Roman period. I then discussed the claim that had been put forward that the objects were palæolithic, and explained why I thought it inadmissible. I added that the most that could be claimed was that the split bones might be neolithic, but I did not think that they were.

The Disputed Objects.

These are the spear-head shaped objects, the rayed discs of shale and the representations of the human figure on shale. Several others have, I understand, been discovered since I went over the collection, but the above are sufficient for the present purpose.

The spear or lance-heads are made of slate, apparently the common slate found on Garelochside and Lochlomondside and elsewhere in the district. It is objected that such objects were never made of slate and would have been useless if they were. This objection, however, is not well founded. Slate tools and weapons, although not so plentiful as those of flint and other hard stones, are not uncommon, and probably have not been so well preserved just because they were less

uable and more liable to breakage. The so-called Picts knives" and the flensing knives of the modern quimaux are of slate. Curved knives of slate have been nd in Norway and Ireland. There are knives, axes and ier implements of slate and sandstone in the National iseum, Edinburgh, and in the museum of the Royal Irish ademy there are numerous articles of slate of the stone-apon or weapon-tool species, and resembling swords, daggers, ives, cleavers and celts. The Dumbuck and Dumbowie ects are somewhat clumsily fashioned, and want the per-tion of form and finish that the best flint tools and weapons nibit; but this was the rule when inferior material was em-yed. Speaking of the Royal Irish Academy's Museum, Sir illiam Wilde remarks:—"So far as I have observed in umining and arranging this collection, all the celts remark-le for their beauty, size, or polish were made out of the best terials, such as flint, porphyry, greenstone, syenite or fel-ne; whereas those of ill shape and rude manufacture have en formed of portions of slate or shale, simply ground down a cutting or hacking edge, and many of which exhibit on ir surface the natural or accidental formation." The one s a costly, the other was a cheap and common article.

Taking the two objects figured by Mr. Millar in the "Pro-dings of the Society of Antiquarians of Scotland," p. 294; l numbered 2 and 3, as typical of the whole, No. 2 corre-nds with the ordinary tanged lance-head of flint, and No. 3 h the dagger or knife exhibited in most museums. They not so well or so carefully made as those in flint, but the m is there.

The real difficulty that these objects present is not, how-r, their shape or their material, but the ornament with which y are covered. Stone tools and weapons of the Stone Age not, as a rule, decorated. There is only one ornamented t in the Dublin Museum, and the decoration consists of allel lines cut on the side. Other stone objects are occa-nally decorated, such as spindle whorls, urns, vases, rings, mps and querns. But it is a question whether a number of se, although made of stone, are of the Stone Age. The called "Druidical pateræ," for example, are comparatively ent; and many of these are decorated with a band of zigzag ament. If, as I suggest, the Dumbuck finds are subsequent the Christian era, the stone objects do not belong to the ne Age. Bronze celts were often decorated on the face h a chevron, and on the side with a herring-bone pattern. e pottery of the crannogs, as Dr. Anderson points out, "was en ornamented with zigzag lines and rude impressed or ised patterns, or covered with parallel lines and triangular rkings." A man of the Iron Age who chipped out a lance-d or a dagger of slate might very naturally add a decoration accordance with the taste of the day.

The same observation applies to the ornamented pieces of e. They do not, in my opinion, belong to the Stone Age, to a comparatively late period, when new ideas and other uences were at work.

While no objects precisely similar to those in question have n found in Scotland, some of the finds in the broch of poch were not unlike those in the fort of Dumbowie. ongst the Tappoch finds were:—(1) Three blocks of sand-ne; on the upper side of one were incised two concentric les surrounding a projecting boss in the centre; on the ond was a circle and portions of two concentric circles rounding a cup-shaped indentation; portions of two similar les are on the third stone. (2) Two oval stones with cup-ped depressions on the upper surface. (3) An oval-shaped ne with a similar depression on each side. (4) A flat pear-ped piece of shale, having a hole at the narrow end; atest length 2½ inches and breadth 2 inches. One side s covered with scratches of a Vandyked pattern. The chs, as Dr. Anderson has shown, belong to the post-Roman iod of Celtic Scotland.

It is unnecessary, and would be unprofitable at present, to ke suggestions as to the precise use of the objects found at mbuck and Dumbowie, or to account for their presence or absence of other objects that might have been expected to e been found along with them. I may, however, remark t no spot in Scotland was more open to foreign influence n this portion of the lower Clyde. In A.D. 81 Julius ricola established a line of forts, at intervals of two or three es, from Bo'ness, on the Forth, to Old Kilpatrick, on the de. Next year he crossed the Frith of Clyde, and marched ough Cowal and Kintyre till he reached the western sea. 139 Lollius Urbicus constructed the earthen rampart that stretches from Forth to Clyde; seventy years later it was ed to by the Emperor Severus, and in 369 it was repaired Theodosius. The Roman legionaries were drawn from many ts of Europe and Asia, from Belgium, Gaul, Spain Germany, from Syria and the banks of the Orontes. e army at the end of the Wall and all along its line required plies of many kinds, which must have been brought by s to the Clyde, and along with them came the busy ental trader, as the sculptured stones in the Hunterian Museum still testify. It seems to me improbable that these vessels would cross the Dumbuck shoal, which was impassable in 1758 for barges and lighters except in times of flood and at spring tides, and if they did not, Dumbuck was the nearest point to the wall where they could unload in deep water. It was likewise the most convenient starting-place for travellers or traders to the lower portions of the frith. But be this as it may, and I doubt whether the structure in question was a quay or jetty, the fact remains that a large foreign population was resident in the locality for three centuries, while during the later times of the Roman supremacy and for long after its close the country was harassed by sea expeditions of Scots and Saxons, Danes and Norwegians, many of whom stole up the Clyde and plundered the inhabitants. It would not be surprising, therefore, if remains of a character somewhat different from those of the native Britons were found. I do not press this argument, but merely mention it as indicating that even if the objects in question could be shown to be of a foreign type their presence could be accounted for.

A large number of the stone and other relics in the museum of the Royal Irish Academy were found in the river-beds, particularly beside fords. Many were got during the operations for deepening the bed of the Shannon. These operations were carried on by digging, a large area of the bed being kept dry for the purpose by means of a cofferdam, and in this way nearly every object that turned up had a chance of being found. Dredging sweeps away everything except when it is so large as to encumber the bucket. The ford of Dumbuck was no doubt a highway in the days of Agricola, as it had been long before and was for centuries afterwards, and would probably have yielded a rich harvest of objects to the antiquary—if it had been dug away and not dredged.

ANCIENT PARISH REGISTERS.

YORKSHIRE, which is rich in historical records, has just established a Parish Register Society for the county. The Archbishop of York and the Bishops of Beverley, Hull and Richmond are co-operating in the movement, which was promoted at a meeting held in Leeds last week under the presidency of Sir George Armytage. Already a membership of nearly 200 has been secured, various societies being represented, and many of the clergy in the county have promised their support. The new society has been formed upon the lines of that already in operation in Lancashire, and the registers of the parishes of Bolton Percy and St. Mary's, Scarborough, will probably be among the first that are published. The registers of Burton Fleming, Arncliffe, Ingleton, Otley, Settrington, Thornhill and Methley are also in view of publication. Mr. Fry, secretary of the National Parish Register Society, has lent his assistance to the work of forming the new society, which is in connection with the Yorkshire Archæological Society, whose transactions are regularly published. Three volumes of the register are to be issued every year to the members and clergy only. The valuable registers in the Torre manuscripts at York have already in part been printed, and these will probably be incorporated with the registers published by the newly formed society.

ROYAL SOCIETY OF ANTIQUARIES OF IRELAND.

AT the meeting of this Society, which was held at 6 St. Stephen's Green, Dublin, on the 28th ult., Mr. F. Elrington Ball read a paper on "Tallaght, co. Dublin, and some places in its neighbourhood," which are to be visited by the Society on April 13 next. He gave a short sketch of Dolphin's Barn and Crumlin, whose church tower, he said, was of some antiquity. The Castle of Drimnagh, an oblong castle of the Anglo-Norman period, containing three storeys, was next described, and its history given. For upwards of four centuries it was occupied by the great family of Barnewall. Clondalkin, which was also to be visited, was remarkable as the site of one of the three round towers still to be seen in the county Dublin. It differed from most other round towers in a singular projecting base, considered by Dr. Petrie to be part of the original design, but generally supposed to be of modern construction. It was 84 feet in height. No traces of the original church remained. In the sixteenth century Clondalkin was accounted one of the walled and good towns of the county. On the road from Clondalkin to Tallaght, Newlands was passed, and adjoining it was the Castle of Belgard, once a strongly fortified dwelling. It was deemed one of the most important castles of the Pale, which was not far off, and often served to protect the surrounding country from the incursions of the O'Byrnes and O'Tooles. Not far off was the Castle of Ballymount or Baile Mota, the town of the moat, which was locally supposed to have been connected with Belgard by an underground passage. Tallaght itself bore few

traces of its antiquity and former greatness as the site of a religious house from very early times, and as the chief seat of the Archbishops of Dublin for five centuries.

It was said to derive its name, which signified "plague-monument," from being the burial-ground of 9,000 of the earliest colonists of the country who were carried off by plague in one week. The ancient church of Tallaght was replaced in Anglo-Norman times by a church of which the belfry still remained, and which had probably some pretensions to architectural beauty. In the churchyard there were the remains of an ancient stone cross, known locally as "St. Mollrooney's loaf and griddle," and a very large stone fort, which was known as "St. Mollrooney's losset." Mr. Eugene O'Curry thought it was intended for the baptism of adults, and Mr. Handcock said it was traditionally stated that it was used for washing the feet of pilgrims who frequented the sacred shrines of Tallaght. In the petition presented by the churchwardens in 1662 with regard to the destruction of their church by Captain Alland, they complained that he fed his horses in the fort, and Mr. Handcock suggested that this must have been the losset. There were several old tombstones. Proceeding now to Oldbawn, the lecturer said that this was an interesting old house of the seventeenth century, fast falling into ruin. It was built in the style then common, with wings extending from the house on each side of the hall-door, and encircling a small courtyard. It had high-pointed gables and great fluted chimneys, and in the centre of the roof there was a small cupola, surmounted by a weathercock, with a clock bearing the date 1727. The hall-door was in a porch with pillars formed of round and square blocks of stone, placed alternately. The ceiling of the hall was low, with large carved beams dividing it into squares; the walls were wainscotted, and there was a curious chimneypiece with the arms of the Bulkeleys, who built the house, on it, and with heads on either side of the slab. The dining-room had a similar ceiling to the hall, and was also wainscotted. The chimneypiece in it, which reached to the ceiling, was a very remarkable one, representing, as Mr. Handcock supposed, the building of the walls of Jerusalem by Nehemiah. Passing by Allerton, they came to Mount Venus, Cromlech, one of the largest of the rock monuments of the county Dublin. Gabriel Beringer attributed the fall of the big stone from its supporting stones to the shock of an earthquake, and suggested that the formation of the Scalp, and a fissure in the foot of the Tybradin Mountain was due to the same cause. Lastly, the lecturer dealt with Rathfarnham Castle, which, he said, was one of the great residences of the county Dublin. It was built towards the close of Queen Elizabeth's reign by her Irish Chancellor, Archbishop Loftus.

Dr. Perceval Wright moved that the paper be referred to the Council for publication.

Mr. George Coffey seconded the motion, which was adopted.

The following papers were also referred to the Council for publication:—"Notes on Crannog and other Finds in Co. Wexford," by Sir Thomas Grattan Esmonde, Bart., M.P.; "The Monuments at Clonmacnoise," by R. A. S. Macalister, M.A.; "The Cryptic Element alleged to exist in Ogham Inscriptions," by R. A. S. Macalister, M.A.; "Kilmakilloge, Co. Kerry," by Miss Hickson, hon. local secretary, Kerry, North.

Correspondence

The Next President of the Institute.

Sir,—There is a rumour afloat that the Council of the R.I.B.A. have nominated Mr. William Emerson, the present honorary secretary, for election as president for the ensuing year.

I venture to think that this nomination will be received with complete astonishment by the great body of members of the Institute, not because Mr. Emerson is not well able to occupy the presidential chair, but because it is not yet his turn to do so.

I am quite aware that there is no obligation, so far as the written rules and regulations of the Institute go, to elect as president one who has filled the office of vice-president, and there may be instances quoted as precedents upon this particular point; but it is none the less certain that the *expectations* of the members are that, given a qualified and willing-to-serve vice-president, he is the man who should pass on to the proud position of president as a matter of justice and of right—far stronger credentials than printed rules and regulations.

It is, I think, a fact open to little question that of the four gentlemen who are now vice-presidents there is one who, from the work in the chair which he has performed during the reign of the present president, from the fair and able manner in which he has ruled the debates under his chairmanship, from the position he holds as an architect in extensive practice, with all the knowledge and value to the Institute which such position entails, and from his consistent courtesy to all brought into contact with him, is fairly and fully entitled and is unquestionably expected to fill the presidential chair for the ensuing year, and that gentleman, I need hardly add, is Mr. Henry L. Florence.

It has been said by some to whom I have spoken upon this subject that it would be unfortunate if a contest were invoked on this election; but of the result of that contest, if it comes about, there cannot be a shadow of a doubt. Every member of the Institute is of one voice, and that voice is that the next president of the Institute should be Mr. Henry L. Florence.

I have not communicated in any way with Mr. Florence upon this subject, and I am, therefore, not aware whether or not he would submit himself for election if a substantial body of his professional brethren requested him to do so; but there is another course open, and one which I sincerely trust will be adopted by Mr. Emerson, and that is that he should withdraw this year from the nomination as president, submit to be nominated as vice-president, and come on in his due turn to fill the presidential chair, which he would then do with the acclamation of the general body of the Institute, and succeed to an honour which, unless it is accompanied by the good wishes of his professional brethren as a body, becomes a mere empty bauble.

I should be glad to hear that Mr. Emerson will adopt the suggestion I have made; it will do credit to his sense of fairness. It may save a contested election, and it will enable the right man to take the right place at the right moment. In the meantime the views of the members of the R.I.B.A., either communicated to me direct or through the columns of this Journal, would be very useful as a guide to future action in the matter.—I am, sir, your obedient servant,

13 Southampton Street, Strand: Wm. Woodward.
April 5, 1899.

GENERAL.

The Exhibition of Works by J. M. W. Turner, R.A., and some of his contemporaries in the Guildhall Art Gallery will be opened by the Lord Mayor on Monday next.

The Municipality of Aix-la-Chapelle, in order to encourage the erection of an English church, have offered a site in the new boulevard, close to the ancient Kurhaus, in the centre of the city.

The Cockburn Association have resolved to express disapproval of the site proposed for the Usher Hall, Edinburgh, as the extent of the powers sought in the Corporation Bill appear to involve great risk to the amenity of the district.

An Important Work on Versailles is about to be brought out in Paris. The subjects of the plates will be selected by M. Marcel Lambert, the architect who has charge of the palace.

Sir Richard Temple will on to-morrow deliver an address at the Gallery of the Royal Society of British Artists on "India as a Field for Landscape Art." The lecture will be illustrated with sketches by Sir Richard Temple. Visitors to the galleries in Suffolk Street will be invited to remain to the lecture, which will be delivered at four o'clock.

The Building Trades in some of the colonies where for a long time there was much depression are improving. In Sydney the wages of carpenters and joiners have been increased 1s. a day. Carpenters, joiners, and bricklayers have all received an advance of 1s. a day in Melbourne, but the demand for them is not brisk, as, owing to the large number of vacant shops and houses, few new buildings are being erected.

Mr. Joseph Randall (of Messrs. Kirk & Randall, Warren Lane Works, Woolwich) has been elected President of the Institute of Builders for the ensuing year.

At the next meeting of the Institution of Civil Engineers on Tuesday next, the 11th inst., the paper on "Alloys of Iron and Nickel," by Robert Abbott Hadfield, M.Inst.C.E., will be further discussed, and, time permitting, a paper will be read with a view to discussion on "Buenos Ayres Harbour Works," by James Murray Dobson, a brother of Mr. Austin Dobson.

At the ordinary general meeting of the Surveyors' Institution held on Monday, March 20, a paper was read by Col. G. W. Raikes (Fellow) entitled "Valuations and Rating in respect of Tithe Rent-Charge." A discussion followed and was concluded, and a vote of thanks was unanimously passed to Col. Raikes for his paper. The next ordinary general meeting in London will be held on Monday, May 1, when a discussion will take place on the "Agricultural Holdings Bill," prepared and brought in by Mr. Channing and others. The chair will be taken at 8 o'clock.

THE

Architect and Contract Reporter

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to rise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

* *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

NEW READING CASE.

Carson's patent file is a handy, complete, and inexpensive contrivance for binding newspapers, periodicals, manuscripts, &c. It is made in various sizes, is nickel-plated, is very neat in appearance, and possesses the great advantage of enabling the pages to be opened out flat instead of their being held together as is the case with any other file with which we are acquainted, and as the margins are not perforated the papers can afterwards be bound in book-form in the usual way. They are to be obtained at Beeching's, Limited, 53 Wych Street, W.C.

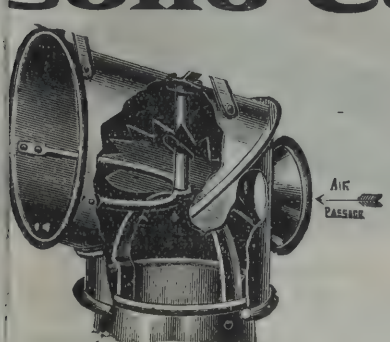
MANUFACTURER OF BRITISH & FOREIGN ASPHALTES.

EVERY DESCRIPTION OF ASPHALTE SUPPLIED AND LAID.



THE BEST MATERIAL FOR PATHS, FLOORS, ROOFS, STABLES, COWSHEDS, COACH-HOUSES, &c.

Parquet Floors Laid in Specially Prepared Asphalte. Highest References Given.

FALDO'S ASPHALTE IS UNSURPASSED FOR DAMP COURSES, VERTICAL WALLS, &c.

Soho Cowl & Ventilator

(NICKLIN & MILWARD'S PATENT).

This COWL has been used as a Ventilator, both on Workshops and Offices, with most satisfactory results, and has proved a conspicuous success as a House Cowl, possessing as it does great suctional power, perfectly noiseless action, and great durability, being made of steel.

The COWL has proved a perfect cure in the case of most troublesome chimneys.

TESTIMONIALS.

"I consider your cowl far above any other cowl in the market, and have much pleasure in recommending it to anyone suffering from smoky chimneys."

"Forward the 10-inch cowls on order at once; we have fixed the others and find they give every satisfaction."

"Your cowl has proved a complete success, no matter which way the wind blows. Please forward me another one at once.

TRADE NOTES.

THE Improved Cork Pavement Company, of 21 St. Mary Axe, has secured the contract for laying their material at the Royal Palaces of Windsor Castle and Buckingham Palace. This is the second order for Windsor Castle, and is evidence that the material is being appreciated by those in authority.

THE Allenton Schools, Derby, are being warmed and ventilated by means of Shorland's patent Manchester grates, by Messrs. E. H. Shorland & Brother, of Manchester.

MESSRS. HUMPHREYS, LIMITED, Knightsbridge, S.W., have secured an important contract from the Royal British Commission, Paris Exhibition, 1900, for the erection of the buildings required by the Colonial and Indian sections.

ELECTRIC NOTES.

THE Pontefract Guardians on Saturday, by twenty-one votes to twelve, passed a resolution that the building committee be instructed to take steps to light the workhouse buildings with electric light.

AT a meeting of the Reigate electric committee the following resolutions were adopted:—"That the plan, with specification, now submitted, be approved;" "that an application be made to the Local Government Board for its sanction to the borrowing at interest of a sum not to exceed 25,000*l.*, and to be repayable within a space not to exceed thirty years;" and "that the designs and specification be printed, and tenders invited."

AT a meeting of the Musselburgh Town Council on April 3, Provost Kier presiding, an agreement was signed with Drake & Gorham Electric Syndicate, London, whereby the company

edged themselves to supply electric light to the burgh at the te of 6*d.* per unit, irrespective of quantity, and for public ghting under the Police Commissioners at the rate of 4*d.* per nit. The Council reserved the right of purchasing the works a going concern after fourteen years at a neutral valuation, ss depreciation, with addition in the name of goodwill of a m equalling the profits for four years immediately preceding, after twenty-one years on the same terms, with two years' ofits in name of goodwill, or after twenty-eight on same terms, th one year's profits as goodwill.

At the last meeting of the electric light committee of dinburgh Town Council it was agreed that estimates should e got for copper and cable to connect the new station at Donald Road with the rest of the system throughout the ty, at a probable cost of 28,000*l.* Estimates were considered r the erection of four new boilers for Dewar Place Station, nd these were remitted to the engineer to consider and report. was stated that there had been 3,682 lamps applied for nce the previous meeting.

Windsor was lighted last Saturday night for the first time th electricity. Ten 2,000 candle-power lamps have been ected in Thames Street, High Street and Park Street; seven o candle-power lamps in Peascod Street and one at Windsor ridge. The other streets of the town are lit with 16 candle-wer incandescent lights, though some of the roads are lit th oil until the electric lighting company has laid the cable them. With arcs there will be 250 electric lamps in the oyal borough. The company has not had much time to stal the light, as its tender was only accepted about three eeks ago. The reason the Corporation came to such a cision for the whole electric lighting of the town was because e gas company wanted to charge 12*s.* 6*d.* more per lamp if ectricity was introduced into the principal thoroughfares, nich would have made their bill greater than when they were sponsible for the whole town.

BUILDING AND BUILDERS.

At a meeting of the eastern district committee of the addingtonshire County Council, held at Dunbar, plans were bmitted and approved of by the Council for the erection of infectious diseases hospital at Belhaven.

The foundation-stone of a new church, to be named St. Thomas, at St. Anne's-on-the-Sea, has been laid. The cost of the building when completed is estimated at 9,000*l.*, but the cost of the portion to be erected at present is 7,000*l.*, and the accommodation will be for 600 persons.

The memorial-stones have been laid of a new Methodist Free church at Armley, Leeds. The site, which cost 1,000*l.*, is in Hall Road, and the cost of the building, which will seat about 650 worshippers, will be about 2,700*l.*

Contracts have been let to Mr. W. Wright, of Warwick Bridge, Cumberland, for the erection of a handsome new lodge at the main entrance to Beaulands Park, for Sir R. J. Graham. The work will be carried out from plans and under the supervision of Mr. T. Taylor Scott, architect, of Carlisle.

At a meeting of the Wrexham Vestry a discussion was opened on the question of restoring the parish church, including the famous tower. A committee was appointed to obtain an architect's report and estimate. It was stated that the whole work would cost about 10,000*l.*

Cardinal Vaughan has consented to the erection of a chapel in honour of St. Winefride in the new Westminster Cathedral. The estimated cost is 7,000*l.*, and Mdme. Mary Teresa Vavasour, of Ramsgate, a well-known Roman Catholic benefactress, has offered to contribute to and collect subscriptions in aid of the project.

At the Walsall Police Court Joseph Barnes, corn merchant, Wolverhampton Street, was summoned for erecting buildings without having first obtained the sanction of the Corporation. The borough surveyor (Mr. R. H. Middleton) said defendant submitted two lots of plans, the first set not having met with the approval of the streets committee. On the completion of the buildings, however, it was ascertained that they had been erected in accordance with the plans which were rejected, and that a corn store and office had been built for which no plans had been presented. Mr. J. N. Cotterell, for the defence, urged that the offences had arisen through inadvertence, and that it would ruin defendant if he were compelled to pull the premises down. For not following the approved plans defendant was fined 10*s.* and costs, the question of the erection of buildings without presenting plans being allowed to stand over for six months, in order that the requirements of the authorities might be met.

The foundation-stone of a cottage hospital for Colne, Lancashire, has been laid by Mr. W. P. Hartley, of Aintree. Mr. Hartley, who has offered 4,000*l.* towards the costs on con-

dition that another 4,000*l.* was subscribed for an endowment fund, offered another 1,000*l.* at the ceremony if the public would raise 5,000*l.* Considerable excitement was caused by the fall of the foundation-stone, weighing about 4 cwt., on to a man's leg, which luckily was not fractured.

AT the last meeting of the Lincoln Corporation it was decided to make application to the Local Government Board for loans amounting to upwards of 10,000*l.* for additions and alterations to the market and for building a model abattoir. Plans are also in hand for a city isolation hospital, the site of which has already been secured ; these are some among many signs of the interest in sanitary science which is spreading in the eastern counties. Many of the leading sanitary engineering firms have already responded to the invitation of the local committee to exhibit at the Health Exhibition to be held in the Drill Hall, Lincoln, from August 3 to 19. This exhibition, the first of its kind ever held in the county of Lincoln, is being arranged in conjunction with the annual provincial meeting of the Sanitary Inspectors' Association.

AT a recent meeting of the house committee of the Glasgow Parish Council it was agreed by a majority to recommend the erection of a hospital to accommodate 1,200 patients. The minority favoured delay, with the object in view of more consideration being given to a matter involving an estimated expenditure of over 200,000*l.* They were also of the opinion that the requirements of the parish for hospital accommodation might be better obtained, alike in the interests of the ratepayers and of the sick poor, through the erection of small district hospitals. The decision of the house committee will come up for disposal at the next Council meeting.

IN terms of a remit made by the Dundee Parish Council an agreement has been entered into between a private party and the Council whereby the former pledges himself to erect new offices for the Parish Council according to plans prepared by the architect of the Council. A site was obtained in the course of the day at the upset price of 60*l.*, this running out to about 5*l.* per pole, the area extending to about 12½ poles. The architect estimates the cost of the buildings at 6,000*l.*, and the Parish Council have agreed to enter on a lease of 99 years, and to pay rent at the rate of 4 per cent. on the cost, and to execute all renewals and repairs.

THE death has occurred of Mr. Daniel Macandrew, a well-known architect and builder in Aberdeen. Mr. Macandrew had been in business for about forty years, and had carried out many important contracts in Aberdeen and throughout th North of Scotland. One of these was the erection of th prison buildings at Peterhead penal establishment, which co 32,000*l.* The firm of which Mr. Macandrew was head a entrusted with all the Government work in Aberdeen for th Office of Works, as well as for the War Departmen Deceased, who was a brother of the Hon. James Macandrew Governor of Otago, retired from business about a dozen year ago. He was seventy-eight years of age, and is survived by widow and one son.

THE foundation-stone of the administrative buildings i connection with the new isolation hospital for Leicester wa laid on the 28th ult. The present hospital was erecte hurriedly during the smallpox epidemic of 1871-72. It is n longer adequate for the needs of the borough, and the ne institution is being constructed on the Gilroes estate, purchase by the Corporation for this purpose, and also for the laying ou of an additional cemetery. When completed the buildings wi comprise four separate one-storeyed pavilions for the treatmer of scarlet fever cases, each pavilion containing 26 beds ; on ward for typhoid cases, containing 28 beds ; two isolatio pavilions, containing 28 beds, making accommodation for 16 adults. Arrangements are made for the addition of furthe pavilions when requisite, so that the full accommodation ma be 240 beds. There are the usual administrative and othe buildings, and the present expenditure authorised is 54,000 The architects are Messrs. Blackwell & Thomson, and the co tractors Messrs. J. Johnson, of Leicester.

VARIETIES.

ACCORDING to a contemporary the vicar of Castle Bytha draws the following pathetic picture of his church :—"Wal leaving ; roofs letting in the rain ; bells cannot be rung ; pew falling to pieces ; foundations giving way."

A NEW theatre has just been opened in Station Roa Doncaster. It has been erected from plans by Mr. J. W Chapman, managing director. It is constructed to accom modate 1,500 persons, and is fitted up with the latest in provements.

THE next ordinary meeting of the Society of Engineers wi be held on Monday the 10th inst., at the Royal United Se vice Institution, Whitehall, when a paper entitled "Machin Tools," will be read by Mr. Ewart C. Amos, M.Inst.M.C.E.

R ROBERT REID, Q.C., M.P., turned on the water for the ear-water tank at the Dumfries and Maxwelltown Water- at Lochfoot on the 3rd inst. The new tank has been l at a cost of between 3,000*l.* and 4,000*l.*, and has a ty of 250,000 gallons, its average depth being 12 feet. ank is lined with white enamelled bricks. It is sur- ed by a well-lighted and ventilated superstructure of ne, the interior being lined with red bricks, and a tiled ay running round the edge of the tank.

:w day-schools connected with the Almondbury parish , Huddersfield, have just been opened. The old schools ondemned for their sparse accommodation in 1893, and infant school, erected at a cost of 1,100*l.*, was opened in nber 1895. The whole of the reconstruction scheme is mpleted at a cost of 4,500*l.* The new schools consist of block (a large central hall, infant school and cloakrooms, east block of classrooms, &c.

SCOVERIES have from time to time been made at rspool, near Warrington, leading to the belief he neighbourhood is the site of the Roman camp is known to have been stationed in the district. igations have been carried on by the Lancashire Cheshire Historic Society and the Warrington m Society, together with several gentlemen interested :arch, and these point to the fact that the site of an old n camp has been struck. Mr. Thomas May, in a paper the Warrington Field Club, stated that the most ne anticipations had been surpassed. The foundations rampart have been exposed, the thickness of which from 9 to 13 feet.

the last meeting for the session of the Historic Society ncashire and Cheshire, Mr. H. Peet, F.S.A., occupied the The paper of the evening, on "Warrington Church prepared by Mr. T. Stanley Ball (who was absent h illness), was read by Mr. W. E. Gregson. A full and description was given of the various pieces of ancient t and well-preserved church plate now in Warrington church, consisting of silver hanap or covered cup, 1615, chalice cup and paten cover, 1627, silver chalice, 1627, silver salver, 1694, silver flagon, 1699, silver flagon, 1720, silver paten, 1722, small silver paten, 1731, and large silver , 1746, several of these beautiful pieces were presented nors who now lie in the church. At the close a long dis- n took place, in which the chairman (who spoke at some length on the importance of this large but little known subject), Mr. A. M. Robinson, Mr. S. May and Mr. W. E. Gregson took part, the hope being expressed that further researches may be made to bring to light many of these little-known treasures of the silversmith's art. A hearty vote of thanks, proposed by Colonel Pilkington and seconded by Mr. S. May, was heartily accorded to Mr. Ball for his paper.

NEW CATALOGUE.

IN the spring the housewife's fancy mechanically turns to thoughts of spring cleaning, which, in addition to the inevitable rubbing and scrubbing, frequently includes to a greater or lesser extent redecoration, refurnishing and furbishing. Hence the appearance at this particular season of the elaborate and comprehensive catalogue produced by Messrs. Hewetson, Milner, Thexton & Co., the well-known furnishing firm of the Tottenham Court Road, is strictly *à propos*, and a careful perusal of its two or three hundred pages prior to a visit of inspection to the emporium itself will greatly facilitate the task of intending purchasers in making their selections. Antique furniture or high-class modern furniture made to authentic antique design may almost be regarded as a specialty of the firm, which, especially, has a high and long established reputation for its admirable productions in carved oak, &c., and their spacious show-rooms contain many excellent examples of all the various "periods," while they also have an enormous array of modern suites and odd pieces at prices to suit all pockets. Many of these are arranged in completely furnished apartments, by which means an accurate impression of the *ensemble* is, of course, conveyed. In addition to the furnishing "lines," a wide choice is offered in what may be described as constructional decoration, such as fireplaces, overmantels, panellings, ceiling enrichments, paper and other wall hangings, while of carpets, draperies, &c., the choice is unlimited.

BRITISH DECORATORS.

RION & CO., 22 & 23 SOHO SQUARE, LONDON, W.

attended this meeting, the primary object of which was to formally elect the general council, in which is vested the management of the business and affairs of the institute.

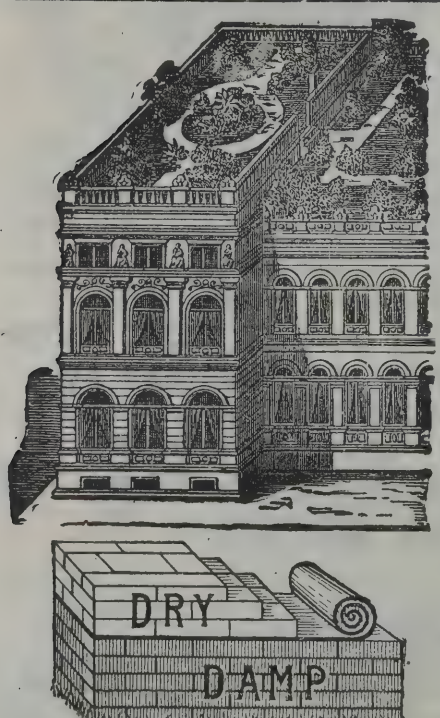
Mr. J. D. Crace, of Wigmore Street, London, was duly elected president of the institute. Messrs. Thomas Bonnar, of Edinburgh; George G. Laidler, of Newcastle; Alexander G. White, of Liverpool; J. C. M. Vaughan, of Hereford; Robert J. Bennett, of Glasgow; and Henry Gibson, of Dublin, were appointed vice-presidents of the institute; and Messrs. William Allon, of South Shields; William Brown, of Dundee; Charles Carlton, of Glasgow; James Clark, of Edinburgh; M. Cowtan Cowtan, of London; M. E. Dockrell, of Dublin; Isaac H. Donaldson, of London; David Laing, of London; John McIntyre, of Dublin; Thomas Preston, of Burnley; John Ratcliffe, of Bolton; John Scott, of Glasgow; James Sibthorpe, of Dublin; John Smith, of Sheffield; William G. Sutherland, of Manchester; John Taylor, of Birmingham; and John Whyte, of Aberdeen, were appointed members of the general council.

Mr. I. Hunter Donaldson, the present master of the Worshipful Company of Painter-Stainers, in whose hall, in Little Trinity Lane, the institute have their headquarters for the time being, at the opening of the proceedings addressed in the name of the Painters' Company a few words of cordial and sincere welcome to the members of the institute, wishing them a full realisation of the hopes on which they had constituted the institute.

Mr. John Dibblee Crace, the president, then addressed the meeting as to the progress made by the institute since the meeting of the provisional council in February last, and it was stated that 174 decorators had become members of the institute, and that in addition upwards of sixty applications for membership had been received by the secretary and would be brought up for consideration and election at the meeting of the general council to be held at the close of the annual general meeting.

Several matters of interest were brought to the notice of the meeting by the President, including the question of the admission of women, if duly qualified, as members of the institute; and it was the general opinion of the meeting that, if qualified, they ought to be admitted.

A further question of subdividing the institute into a larger number of districts than at present was also considered, but it was thought that further inquiry should be made, and reports were invited from the various local associations.



The President then invited the members present to ex their views as to the expediency of compelling applican admission as members of the institute to submit to an e nation before being admitted to membership, and pointe that, in his opinion, to insist upon such a test would be to k institute at the very start; for it was obvious that men wh been in business for many years, and who were of estabi reputation, would not submit themselves to examination as a dition of admittance to an institute only in its infancy. President further stated that all applications for admi to membership of the institute would have to come befor general council for election, and every applicant would to be nominated by two existing fellows of the institute that every care would be taken both by the general c and by the fellows nominating that no unsuitable pe should be elected, and that, at any rate for the present, this s afford the institute a sufficient protection against the a sion of unsuitable members. Several members prese pressed themselves as of this view.

At a meeting of the General Council which was subsequ held new members were elected to the number of fifty-s whom forty-four were elected as Fellows and twelv Associates. Several of the leading decorators in London applied for admission to the Institute since the meetin held.

THE ROTHERHITHE TUNNEL.

THE projected tunnel to connect Rotherhithe and Sha now under consideration by the County Council, say *Standard*, is by no means novel as a proposal or as a d It has long been in demand, arising out of the necessity f means of transit across the Thames below London B As far back as 1877 the Metropolitan Board was press establish a means of crossing the river at Shadwell. De tions urging this improvement included Mr. C. T. Ritchi the local authorities, together with traders and others. In an interesting report on the subject was laid before the by their engineer, Sir Joseph Bazalgette, proposing b bridge across the Thames at the Tower, and two tu or subways lower down, one at Shadwell and the at Blackwall. The cost of the proposed bridge the two tunnels, including the purchase of pro and compensations, was estimated at fully five mi

PATENT
VULCANITE ROOFIN

Since the introduction of the patent Vulcanite Roofing into this country it has be by a great number of leading architects for Public and Private Buildings, Hotels, Schools Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter than under any other roof. When properly laid repairs are never required, and a guaranteed. The roof-surface can be used as a garden, or for any other purpose. construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any wi inches, being more convenient than the usual damp-course slabs, and saving laps. Pric quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c. SARKING under slates or tiles, manufactured in five different qualities and in rolls ficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, re Sheet Asphalte, free.

g, and before embarking on such an expenditure the wished to know whether there was a chance of the Coal being continued beyond 1889, when, unless renewed, ould expire. After a long interval the Government gave avourable reply. The Board thereupon resolved to limit rojects to one tunnel, for which the line selected was en Nightingale Lane and Tooley Street. The Bill for roject was laid before Parliament in 1884, but was ly opposed and finally rejected. The select committee House of Commons, to whom the Bill had been referred, ted a special report on the result of the inquiry, in which xpressed a hope that if the City Corporation would under- he work of making a low-level opening bridge at Little Hill, the Metropolitan Board would construct a subway adwell. The Tower Bridge was soon commenced, but oard never undertook the tunnel at Shadwell, giving ence to a tunnel or subway under the river at Blackwall. e report by Sir J. Bazalgette, in August 1882, is remark- s showing how near the Metropolitan Board came to the uction of that which Parliament is to be asked to sanction next session. The estimate for the Shadwell Tunnel was ,040,000*l.*, being 1,500,000*l.* for works and 540,000*l.* for The present estimate is 2,198,250*l*, the works to cost 000*l.* and the property 798,250*l.* The reduction in the te for the works may be attributed to improved modes of ion, while the rise in the other item may be attributed to uses. In the first place the property item includes the f rehousing those persons of the working classes who may placed by the carrying out of the scheme, while in the lace allowance must be made for the natural rise in the of property in the course of seventeen years. But the y Council have endeavoured to reduce the cost of ing property by a deviation from the route proposed in an of the Metropolitan Board on the northern side of ver. Still, comparing the scheme of 1882 with that e present date, the similarity is so great that the ay be pronounced identical in all their essential features, endering the scheme of 1899 a revival of that which was ed at the earlier date. In each case the open approach tunnel commences at a point described as the junction ion Road with the Deptford Lower Road. For some ce the course pursued is about parallel with the river. ng the East London Railway by means of a bridge at rhithe station, the present route will consist of a cut-and- portion extending from the railway to Dodd's Place, where the first shaft will be situated, and where the tunnel will commence, proceeding under the premises of the South Metropolitan Gas Company to the second shaft near the Surrey Lock entrance of the Commercial Docks.

The entire works at Rotherhithe may be described as forming an eastward curve sweeping round to the north, so as to give a general course to the north-east. The tunnel passes under the Thames on a line running due north, in a direction oblique to the course of the river. Were the crossing at right angles, the length of the tunnel would be, to some extent, abbreviated, but this is rendered impracticable by the interposition of the docks on either side. The tunnel having passed westward of the Commercial Docks at Rotherhithe, proceeds under the river so as to pass eastward of the Shadwell entrance to the London Docks, and westward of Shadwell Market. It is proposed to sink the third shaft on premises close at hand, whence the tunnel will proceed partly on a curve and partly on a straight line to the fourth shaft, on the north side of Broad Street, close to Collingwood Street, where the cut-and-cover construction commences, terminating in an open approach. The Commercial Road East is thus reached after traversing a distance of a mile and a quarter from Union Road on the south. It is pointed out that the corresponding length of the Blackwall Tunnel is as much as two miles, this being the interval from one main thoroughfare to the other. The tunnel under the river at Rotherhithe will be level for rather more than a thousand feet, and will have a gradient of 1 in 75 for a length of 640 feet. Elsewhere the gradients will vary from 1 in 34 to 1 in 50. The width of the thoroughfare in the tunnel is to be 17 feet for the carriage way and 4 feet 2 inches for each footway. The headways are intended to be 18 feet 6 inches at the centre of the carriage way, and 15 feet 7 inches at the channels. The bridges committee point out that the accommodation in the Rotherhithe tunnel will be decidedly superior to that provided in the tunnel at Blackwall. In order to secure this result it will be necessary to make the outside of the proposed tunnel 30 feet in diameter, or 3 feet larger than the outside diameter of the Blackwall tunnel.

An important question arises as to the difficulties likely to be encountered in the execution of the tunnel, owing to the nature of the strata that will have to be passed through. It is thought that under the river and on the north side there will probably be less difficulty than in the case of the Blackwall tunnel; but it is admitted that the presence of water may inter-

fere with the construction of the deep cut-and-cover portion on the southern shore. On inquiry it appears that at first the cut-and-cover portion on the southern side will be in clay. At the first shaft varied strata will be encountered, with a considerable intermixture of water. Proceeding onwards, green sand and pebbles are to be met with. Passing the second shaft there is ballast and green sand. Here the level portion begins, at a depth of 70 feet below high-water mark. From the third shaft the work on the north side will pass through coloured clay and portions of the Woolwich beds. Blue clay will prevail in the vicinity of the fourth shaft, while the cut-and-cover will be carried through clay and ballast. The crown of the tunnel will be from 10 to 15 feet below the bed of the river in the central part. The working being done by means of compressed air, as in the Blackwall tunnel, water will be excluded from above, though it may work up from below.

In their report on the subject of the tunnel and the purposes it will serve, the bridges committee of the County Council give statistics showing the great extent of the population requiring the facilities of transit which will be conferred upon them by this means of crossing the Thames. Taking the north side of the river, it is shown that the population immediately affected would exceed 386,000, while on the south side the number would be 241,000, or a total of 627,000. Including the population indirectly benefited, the total is raised to 1,440,000.

Remarks are offered as to the benefits that will accrue on the northern side of the river in connection with the traffic to and from the docks. The St. Katharine and the London Docks and the Regent's Canal Dock will be in close proximity to the tunnel. A large proportion of the merchandise passing out of the gates of these docks has to be conveyed to the south side. At the present time the streets near the docks are blocked by the traffic, and it is said to be imperative that relief should be afforded to enable the traffic to get to its destination. This aid the tunnel will give by taking many hundreds of vehicles across which have now to find their way by London Bridge or the bridge at the Tower. A matter of considerable moment consists in a proposal now before the Council for so enlarging the design of the tunnel as to provide for the reception of a tramway line, which could be connected at points close to the approaches of the tunnel with the existing tramways in Commercial Road East, which are the property of the Council, and also with those in Union Road, Rotherhithe, which will become purchasable in 1900. Apart from the tramway proposal, it is to be observed that if the Coal Duty had been continued the Rotherhithe tunnel would have been constructed years and would now be affording that relief which is so desired.

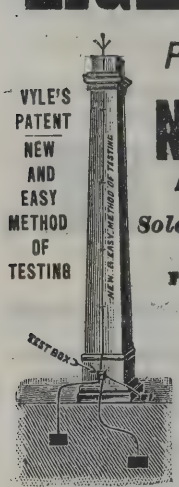
BRITISH INDUSTRY AND FOREIGN COMPETITI

In a letter to the editor of the *Times* Mr. P. E. Pil writes :—

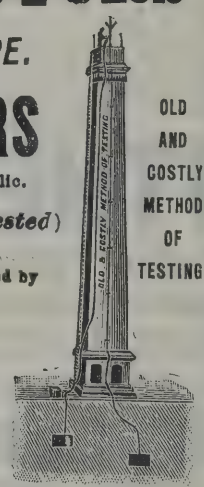
The employment of an American firm to carry out a po of the engineering work in connection with the railway b at Atbara in preference to British firms is attracting cons able public attention, but it is far from being an isolated inst of the kind ; indeed, those who have to do with constru operations even in England are so accustomed to the B being beaten out of the field in competition with contin and American manufacturers that the interest excited b Sudan order appears to them to be difficult to understand.

It is now impossible in many branches of work to i that it shall be the product of British workmanship and a r for the employment of British capital.

Let me give your readers a few examples.



I believe that if the facts could be collected it woul found that the greater portion of the iron and steel girders in the construction of the large buildings now being erecte London and the large provincial centres comes from Bel and Germany.



For years I have been trying to give the preferen British products in this particular, but with only partial su Now it is clear I must give up the unequal contest, answer to an inquiry I have just made to one of the few who have hitherto supplied girders of British manufact am told that the Belgian or German article is from 20*s.* t a ton cheaper delivered in London, and that whilst a tim be specified for the completion of the works in their case impossible to specify a time if British steel is used. The re is lack of enterprise, only one or at most two English rolling a sufficient variety of girders to be able to supply out delay, whilst there are several continental firms wh supply almost any quantity of nearly every kind of gir the shortest notice. This has been going on to my know for several years.

Again, I have been very anxious to use British slate certain colour on a number of buildings, but I have met nothing but difficulties.

I had the choice of a British slate and of a slate of si

ur and character imported from Germany and one from erica. It is a fact that the British slate was the best in ur and thicker; in fact, unnecessarily thick, requiring a e expensive roof to support it, and likely to endure much er than modern buildings are called upon to last, owing to changes which take place in our great towns. But these antages had to be very heavily paid for. The British slates e 40 per cent. dearer, and no guarantee could be given as hen they could be delivered.

The gentleman who represented the British firm may be sidered as being admirably equipped for his vocation from British merchant's point of view, for he had never seen the rries whose products he was trying to sell, he could not tell thinner slate could be supplied at a lower price and gently recated any inquiry on the subject being made at the rry, and was unaware that American or German slates were ig offered in the London market at a much lower price n British. He was, in fact, quite a representative British eller.

Without encouragement from him I ventured on some ish slates and started a building or two with them, but soon to give up, for the supply could not be maintained, and on remainder of the buildings a foreign slate is now being l.

Let us take another example.

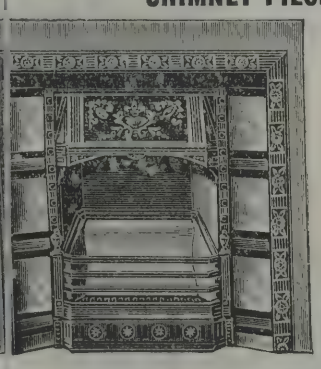
In the ventilation of a public and a large business building erected I desired to employ a British firm and sent for an lish manufacturer to come and see me.

The reply came written on the back of a printed sheet ng a list of the many buildings then being ventilated by firm's system, that Mr. Blank was in the country, but on eturn in about a week's time he would wait upon me.

In the meantime my clients, who had some knowledge of erica, drew my attention to an American firm carrying on ness in London, and their representative on a hint from n called upon me. I found him a well-educated, intelligent interesting personality, full of his firm's particular system, to explain its operation with a wealth of scientific know- e and practical instances, able also to defend its principles nst objections and to favourably compare it with its British petitors.

The Englishman was completely outclassed. He was too and when he did come he knew nothing about the erican system, and on a hint of competition showed signs tiring into his shell.

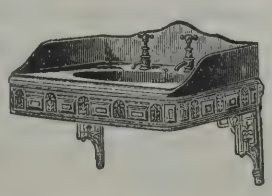
I was able to draw a moral when shortly afterwards I found an English firm contentedly fitting up, in a subordinate capacity, the appliances which American ingenuity had invented, American energy had obtained the order for, American workmen had produced, and of which American capital was about to reap the profits.



Much of the success with which foreigners are beating our countrymen out of the field may be due to our labour troubles. That I do not propose to enter into now, but to my knowledge much of it is due to the hidebound conservatism and lack of ideas which characterise many of those engaged in carrying on British manufactures and trades at the present moment. There seems to be little enthusiasm for their work in the minds of those to whom are entrusted the making of arrangements with the consumer. The Englishman is worse educated than the foreigner, less keen to arm himself with every item of knowledge that can be acquired concerning his work, less able to see that in the successful carrying out of a matter of business there is something elevating to the character, and that in entering into, appreciating, and perhaps even in influencing his customer's needs there is an element which may make his life interesting and satisfying. He has his own article and thinks that if it does not do it ought, and should be made to.

The Englishman one meets in such capacities seems to think that the great object is to expend as little force, energy, initiative and vigour as possible in the execution of any work he has in hand, and this is why he is a mere tiro by the side of his foreign competitor, bred on ideas and educated with a fulness and breadth of which we in this country have little conception.

The interesting account of the Japanese system of commercial education which appeared in your columns some eighteen months ago should open our eyes to what is necessary in this direction. If the country is not to take a bad fifth or sixth place in the markets of the world, which she will surely do if the foreigner is allowed to beat her sons out of her own home markets with the ease with which he is beginning to do so, a higher quality of mental capacity and training must be expected of those who represent this country.



The last generation of middle-class Englishmen who read and thought were brought up on the creed of Carlyle and Kingsley, and many of them saw dignity in the hard work and strict performance of duties taught by those writers, to whose influence some of our commercial prosperity was due.

To-day Mr. Kipling is teaching us the lesson of strenuousness. His illustrations, however, are drawn from the career of the soldier and sailor and the administrator of subject races, and hardly bear a direct message to the man of manufactures and commerce.

Perhaps when he has recovered from his present illness he will discover for us that the administrators of our manufacturing and commercial firms and the commercial traveller are not necessarily condemned to a barren materialism, but that there is a fertile world of ideas in which they may live their lives not without advantage to themselves and with decided advantage to the race of which they form so large a part.

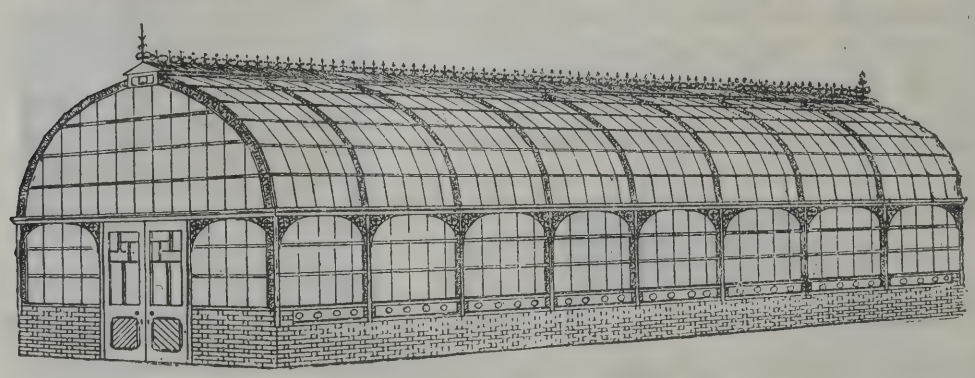
ROAD-MAKING IN PERSIA.*

The new road from Resht to Teheran is the latest move that Russia has made to widen the circle of her Persian trade.

During a recent visit to Teheran and Russia I had an opportunity of obtaining the following details with regard to this undertaking.

The concession to construct this road was given in 1893, and includes the right of widening the entrance to the Murdab at Enzeli. It was granted to the "Compagnie d'Assurance et de Transports en Perse," founded by Mr. L. S. Poliakow, of Moscow, who is also the founder of the International Commercial Bank of Moscow, which has a branch office at Teheran. It is said that the Russian Government have shown a keen interest in this scheme, and that it was at their request that Mr. Poliakow undertook the enterprise. At all events, it was no doubt through official pressure that the chief merchants and manufacturers at Moscow who have, or are in the future likely to have, business relations with Persia, became shareholders of the company to which the concession was sold, and which was formed with a capital of 1,000,000 roubles in 1,000 shares of 1,000 roubles. Some of the Moscow firms took as many as 100 and 150 shares.

At first the work was taken up with much zeal, but, possibly discouraged by the formidable difficulties met with as soon as the higher ranges of the Elburz were reached, and which necessitated a larger expenditure than may have been foreseen, this energy became gradually less, until it looked as if the plan had been abandoned. In 1897, however, Colonel Mszichovsk who had been given charge by the company of the whole wor came to Persia on a visit of inspection, and soon after h return the Russian Government decided to come to the assis ance of the company by taking debentures to the amount 1,000,000 roubles, on condition that the work should be finishe without delay. According to the terms of the concession th road should have been ready for traffic at the end of last yea but a prolongation of one year was obtained. Finding that th 2,000,000 roubles were not sufficient to complete the road, th Government again came to the aid of the company by takin another 500 debentures of 1,000 roubles, on condition this tim that the capital should be increased by 700,000 rouble This was done (most of the shares were taken by t original shareholders), so that the company is now workin with a capital of 3,200,000 roubles (1,700,000 rouble shares, a 1,500,000 rouble stock), or, say, 340,000*l.*



This no doubt seems a large amount, but it should be born in mind that it includes the cost of the concession, Enze Kazvin, with extension to Hamadan, at 40,000*l.*, and the pu chase of the Kazvin-Teheran road at the same price. Th cost of the actual road-making has been 30,000 francs p kilometre, and that certainly does not seem excessive, as th difficulties have been great. Between Pir-i-Bazaar, Resht a Kuhdum, for, say, twenty miles, where the soil is exceeding marshy, large quantities of stone brought from distant mou tains had to be used in many layers before a sound foundati could be obtained. This work went on for two years, and w much hampered by the fact that rice is cultivated in ma places on both sides of the road; the complicated system dams and dykes for irrigation purposes making the work ve tedious. At first Russian workmen were employed, but the m tality among them in the lowlands near the Caspian was ve great; during the first year thirty out of 300 died of malarial fev They have been replaced by Italians, who resist the clima better. After reaching the mountains difficulties of anoth but hardly less costly nature arose. Near Rudbar, Menjil a Mullah-Ali not less than fifty miles had to be cut through so rock by means of "roburite" imported from England.

The local management is in the hands of Captain Glinoefs who has had much experience of road-building.

Starting from Pir-i-Bazaar on the Murdab, the road (miles) turns to the left quite near Resht, crossing the Rud by a wooden bridge, thus avoiding the town with its narr streets. It then follows the old track to Kuhdum, and w

cticable last spring for carriages as far as Ziah Rud, arsakhs, or about 30 miles from Resht. The road now ins to climb in earnest, and it frequently leaves the old e track. In April I found it levelled and ready for use as as Rudbar (14 farsakhs, or about 47 miles from Resht), and I e just heard from Colonel Mszichovski that it has been ned for traffic as far as Menjil; that is, half the distance veen Enzeli and Kazvin.

From Rudbar to Menjil and Paichenar several gangs, of ningly over 100 men each, were at work blasting and pick-ıg the solid rocks of limestone which line the Sefid Rud so ressively.* All travellers to Teheran will remember the roach to the Menjil bridge coming from Resht, and will ise the enormous expenditure of work that was required to a road with a practicable gradient through these forbidding ses. Here the old road, a veritable rock ladder, on which unfortunate mules or chapar horses have to clatter as best r can, has been of no use whatever to the new one. Under e circumstances, it was necessary to limit the width to the owest possible dimensions. At such places the road is etres (16½ feet) broad, but at distances of 200 metres it has der stretch, so as to allow for the passage of two carriages. normal width between Resht and Teheran will be schens (21 feet); the usual gradient is 1 in 24 to 1 in 20, in w exceptional cases 1 in 15

Nothing has been done so far to the bridge at Menjil, of ch, as usual of late years, a couple of arches have fallen in. ıvans have at present to pass with great precaution by a rickety construction of wooden rafters, supported by and attached to the pillars of the bridge. Carriages could not possibly use this quaint structure, which is very narrow and about 142 yards long. As it is cheaper in Persia to build a new bridge than to repair an old one, it has been decided to replace the present structure by one of iron. The material has arrived from Russia; but as the Sefid Rud is a stream with a considerable current the work of spanning it will take time, and it will be no doubt necessary, for some months after the completion of the road, to change carriages at the bridge, crossing it on foot with the horses.

At Paichenar a young engineer, M. Wolfenseider, has his headquarters. So far, the new road has followed on the tracks of the old one, except for a few short deviations. But it is now approaching the Kharzan Pass (about 7,500 feet), a conclusive barrier to anything on wheels. The two roads here part company, and the new one, following the telegraph line as far as Kuhin, makes a detour of about 12½ miles by following the left bank of the Yuzbashi river, and, passing by Mullah-Ali, where another iron bridge will be built, rejoins the old road at Agha-Baba. I have not visited this part of the road. Last spring work there had not been commenced. It is now well on its way. General Schindler is, as far as I know, the only traveller who has described this section, and his itinerary is the same as that adopted by the Russian company. The following is a brief summary:—

"Leaving Teheran (in July 1879, just before the construction of the present Kazvin road) Agha-Baba is reached by a good road of 14 miles. Continuing almost due west, the Bascher is crossed (2 miles) and passing Bumehin a descent to the Do-deh plain, followed by an easy ridge, leads to the large village of Kuhin (5,106 feet) situated in a fertile valley (5 miles from Agha-Baba). Nearing the Azalek, a small stream, by a somewhat sharp climb, the Aspabin plain is reached, dominated by the Piruz. The direction has now become north-west, and at Beg-Baghi (3,056 feet) changes to north, when the road traverses the broader watershed of the Yuz-Bashi, where, as a sign of a milder climate, figs and oleanders are observed. Following the windings of this valley the winter settlements of the Ghaswend nomads are passed. The road now enters the valley of Mullah-Ali (also called Hassan Khani) with the finely-situated village of that name, which is deserted in summer. Here a bridge is required during the spring floods. A couple of miles further, passing the village of Kogir, the post-house of Paichenar is reached (1½ miles beyond Paichenar the Yuz-Bashi joins the Shah Rud,

The following details about the staff and workmen employed may interest. Besides the chief engineer, M. Glinoefski, there are in a two engineers and twelve assistant engineers or chiefs of sec- (this number has been gradually reduced as the work advanced). ıer, a chief book-keeper with two clerks and five or six juniors. a doctor and several assistants. The number of workmen was at about 4,000 (1,000 horses and donkeys for the transport of el), but at present there remain only a few hundred in the sections that have not been completed. They are chiefly ans and Kurds, and a small number of Greeks, Turks and ns. There are few Russians employed now, for reasons already ined. On the whole, nearly a million cubic metres have been with, of which about one-third, in rocky parts, was where the pean workmen were chiefly engaged, because the Persians of the ian provinces are deficient in energy and strength, on account of limate.

which at Menjil unites with the Kizil-uzun, forming together the Sefid Rud)." In a footnote the general character of the road is described as offering much less difficulty than the one crossing the Kharzan Pass. The undulations are more practicable, the winters are milder and more free from snow. Many villages are met with. Incidentally the road is mentioned as being the one chosen for the then (1879) projected railway from Resht to Teheran.

Between Paichenar and Kazvin two new post-houses will be built; on the other sections the existing stations will be put in thorough repair.

At Agha-Baba the gradually rising plain is entered that stretches to Kazvin and Teheran, and there are now no more engineering difficulties to contend with; in fact, a rough cart-road has been in use for some time as far as Kazvin, and all that has to be done is to metal it and provide for drainage. From Kazvin to Teheran a regular carriage service has been in existence for about eighteen years. It is at present farmed by a Persian, who keeps the service in a fairly efficient state. The distance of ninety-six miles, divided into six stages of equal length, is covered in sixteen hours under average circumstances. After a heavy snowfall there is delay. The road has an excessive width, and is not metalled. The bridges are in bad repair and unsafe. The Russian company will have to spend a considerable amount of money to bring this road up to the level of what is being done beyond Kazvin; but this, in good time, will be accomplished

The company does not intend for the present to undertake the carriage of passengers, mails and merchandise, although it has acquired the right to do so. The revenues of the road will, therefore, have to be derived entirely from the tolls. These have been fixed at 4 krans (say 1*s.* 6*d*) per pack animal (horse, mule, donkey or camel), from Resht to Kazvin, and the same from Kazvin to Teheran. Carriages pay 42 krans (17*s.*) for four horses, 30 krans (12*s.*) for three, 20 krans (8*s.*) for two, and 10 krans (4*s.*) for one. Loaded carts pay 50 krans (20*s.*) each. A proportionate deduction is made for a shorter distance.

People at Teheran are waiting impatiently for the completion of the road, and no doubt much polite pressure is being exercised, not the least by the different legations. In fact, the chiefs of the two principal ones have had personal experience of the hardships of the old order of things. Both Sir Mortimer Durand and M. Argiropulo have been detained for days in very uncomfortable huts near the Kharzan, waiting till a path had been made through the snow. The sufferings of the great often bear good results for the multitude. Foreign ministe travel too seldom on other roads in Persia.

M. Mszichovski is very sanguine that the entire road w be finished by the end of May, and it will be opened with so ceremony in the presence of the Sadrazen and the Russi Minister at Teheran, who have been invited by the company visit Resht for that purpose. Should there be unforeseen del the inauguration will probably be postponed until the autum because the weather in Persia between May and September too hot for such a prolonged picnic.

PATENTS.

[*This List of Patents is compiled specially for this Journal Mr. G. H. Rayner, of the firm of Rayner & Co., C sulting Patent Agents, 37 Chancery Lane, London, W from whom all particulars and information relating Patents may be had gratuitously.*]

Applications for Patents

6103. John Fleming Wallace, for "An improved ventilat cover for drain traps."

6186. Eliza Harriett Spettigue, for "The Pyramid s corner block."

6311. Fitz Gehre, for "Improvements in artificial stone."

6513. Wilson Adolphus Allen, for "Improvements in inva elevators."

To Inventors.—Patents for Inventions, Trade-marks and Des secured; every assistance given to inventors. Specialists in Build matters. Information free.—Messrs. Rayner & Co., Patent Age 37 Chancery Lane, London, W.C.

The new parish church of St. Aidan's, Bradford (M chester), was consecrated by the bishop of the diocese on 30th ult. The church, which seats over 500 and has c £6,600, is of a simple character, consisting of one span, w organ-chamber and vestries for the clergy and choir. architect is Mr. R. B. Preston, and the contract work has b carried out by Mr. R. Carlyle, of Ardwick.

The Architect.

THE WEEK.

"Good wine needs no bush" is an English proverb which may have originally expressed the thought of a painter of tavern signs and inscriptions who was annoyed by the economical innovation which made his art superfluous. Whether signs or inscriptions came first it would be difficult to decide, but both can set up a claim to the privileges which antiquity confers. Another archæological question arises. Were the signs and inscriptions derived from the mottos on drinking vessels or the reverse? That such questions can have interest is plain when we find the French Académie des Inscriptions devoting a sitting to a consideration of a couple of lines which were found on an earthenware tankard, viz.:—

OSPITAREPLELAGENACERVESA
COPOCNODITVABESESTREPLEDA.

At first sight one is disposed to take such combinations of letters as expressing something of the value of Mr. Pickvick's immortal discovery; but the inscription is of the early Merovingian period, and expresses the two phrases, "hospita, reple lagenam cervesia," and, according to one interpretation, "copo: audi, tu habes, est repleta." The first line we may take to mean, "Hostess! fill up my cup!" But surely not with beer. The other is the reply, "Can't you hear? Here it is, full to the brim." About the first there is not much difficulty, but the second is not easy and has given rise to a discussion among the Academicians. For what does "cnoditu" signify?" It is supposed by some to be a mis-spelling of "conditum," and was the name of a spiced wine. The second line could therefore be interpreted as a continuation of the order given in the first, and if "repleda" is "replenda," it would be equivalent to saying "Let it be the sweet wine; (but quick) my cup is empty." The language used by the Roman soldiers and immigrants in France was not Ciceronian, and modern French retains some of their barbarisms, so we must make allowance for the shortcomings of the ancient potter. But could he or the host or hostess or the wine-bibber anticipate that ages after the revel some of the foremost scholars in France would be at loggerheads in an endeavour to discover the meaning of a tavern joke?

Crannogs usually consist of several dwellings standing on piles, but one has been discovered at Hyndford, near Lanark, by Mr. A. E. Smith, which was a single dwelling. It is also a post-Roman example. The piles form a circle about 34 feet in diameter; within the space at irregular distances were several fireplaces rising to some height above the clay flooring, and surrounded by masses of ashes and charcoal, mingled with occasional relics of the occupation of the structure. The clay floor, laid as it was over a substructure of brushwood, had subsided more than once owing to the decay of the supporting substratum, and on this account both floor and hearths had been heightened as became necessary. One of the special features of the crannog is that a large proportion of the relics it has yielded are unmistakably of the Romano-British period. Among these may be noted fragments of at least six different kinds of Samian ware vessels and several of the coarser white earthenware, including two handles of a very large amphora. There were also some fragments of a square-shaped bottle of blue glass, some of those ribbed beads of porcellanic paste, and armlets of blue and green glass, and iron axe-heads, similar to those usually found in Roman stations in the south of Scotland. Along with these there were also a spiral bronze finger-ring, a large collar-shaped ornament of bronze like the so-called torc from Lochar Moss, consisting of a number of bead-shaped knobs, flat on one side and strung upon a bent rod, apparently of iron; a cup-shaped vessel of steatite, with a pierced handle; a smaller stone cup, a polished stone axe and a polished disc of stone, and several whorls, whetstones and a portion of a stone mould. The Hyndford crannog must be considered as unique, and much credit is due to Mr. Smith for revealing so interesting a relic to archæologists.

The latest number of the *Architectural Review* is mainly a monograph by Mr. E. Prioleau Warren on "The Work of Messrs. G. F. Bodley & T. Garner." It is satisfactory to know that English artists, like English writers, are appreciated in America. In that way the friendliness of the two countries is fostered. Mr. Warren in his article is inspired by a spirit that is almost affectionate, and, indeed, it would be difficult to say too much about architects who have convinced their age that Gothic is no obsolete form of architecture. The character of the two will be derived from the following extract:—"Thoroughly in unison as regards the essentials of their art, at one in reverent homage to the past, the partners present a wide diversity of personal character, a marked individuality of mind and manner. A poet in temperament, a musician by nature and acquirement, endowed with a rich facility of imagination, and with a singularly refined and sensitive feeling for form and colour, Mr. Bodley brought to the partnership a distinguished and acknowledged talent, an established and growing reputation, founded upon several years of single-handed work, and the creation of several buildings of unusual interest. Mr. Garner, considerably his partner's junior, contributed wide and scholarly knowledge, a highly educated taste, an acute and skilled perception, and an admirable power of draughtsmanship. He further contributed the experience gained in small but responsible work of his own, and an enthusiasm matched by indomitable energy." In conclusion, Mr. Warren says of his friends:—"Their aim has never been to startle, they have never 'played to the gallery,' they have ever avoided the obvious ingenuities that recur so tiresomely in much of modern design. The quality of their work is as remote as possible from the mock rusticity, the 'cottagey' affectation that is one of the prevailing architectural sins of the moment. Their manner is essentially the grand manner. They have exercised a very palpable influence upon their contemporaries by the sheer force of distinguished example; their reputation will long outlive them, for they leave to posterity not only a great number of beautiful buildings, but a record of conspicuous ability, high probity and unfaltering conviction." The article is abundantly illustrated with reproductions of photographs.

Tendering, we suppose, must henceforth be considered as inevitable with all businesses connected with building. One late instance is afforded by the Brentford Board of Guardians. The plans are ready for a new workhouse which is to cost from 70,000*l.* to 90,000*l.* A surveyor offered to take out the quantities at 1 per cent. Low as was the charge, it was resolved to ascertain whether cheaper bills could not be discovered. An advertisement was issued. No less than fifty tenders were sent in. The percentages varied from the recognised $2\frac{1}{2}$ per cent. to three-eighths. The Guardians did not accept the lowest tender. The work was given to the surveyor who had previously offered to undertake it at 1 per cent., but at the reduced rate of $\frac{3}{4}$ per cent. The victory makes the economists proud, but they cannot realise the task which the surveyor has undertaken.

Archæological "finds" are not always to be valued according to their artistic merit, and the discovery of Dr. Ernst Steinmann in the Vatican is an example. The stanze are associated with Raphael's genius, for on the walls he executed commissions given by Julius II. and Leo X. But after the great artist had demonstrated his supremacy in the *School of Athens* we know that Giulio Pippi and other artists were not afraid to attempt painting the walls. It is, therefore, safe to conclude that before Raphael appeared in Rome efforts were made to adorn the rooms. Remnants of these early paintings have come to light. They are not of much importance in the history of art, for they have an amateurish aspect, but they suggest that the whole of the walls of the stanze were covered with a series of paintings which may have helped to originate the great works which followed. Raphael began with the intention of celebrating the deeds of Julius II., and the *Heliodorus* expresses the Pope's desire to expel the French from Italy. Leo X. afterwards resolved to symbolise his own pontificate, and the discovered wall-paintings may relate to some predecessor of Julius II.

FIRE PREVENTION.

THE fatalities which fires have lately caused in England and America have excited some alarm, especially among nervous people. It must be allowed that when one thinks that the most terrible of deaths may strike down anybody, and that in most cases all efforts to escape which an individual can make are vain, the strongest must quake before the dreadful vision which arises. What adds to the terror is that all the organisations for extinguishing fires and saving lives are often of no avail in an emergency. It is inevitable that fires must occur and that fatalities will follow, but happily the deaths are less numerous than people suppose, especially in times like the present, when there is a disposition to be panic-stricken.

The fatal cases would be less numerous if simple precautions were more generally adopted. The majority of fires are caused by carelessness, or from an excess of confidence in good luck. If people in private houses, workshops and factories would realise how easily a fire can arise, and with what rapidity its dangers increase, we should then see a very different return of disasters published every year. But the belief in exemption from dangers that afflict others, which is one of the characteristics of most men, inspires temerity, with what consequences is known to every fireman. The modern organisation of society also leads people to suppose that for protection of every kind they are to trust to constituted authorities. Judges, in trying cases brought against railway and omnibus companies, are often compelled to point out that passengers are not to assume they are mere parcels bearing the inscription "with care." They must exercise common sense, and if they will act irregularly it is not to be expected officials will be on the spot to shield them against the consequences of their own acts.

Just now it appears to be supposed that houses and other buildings should be constructed in such a way that when through carelessness a fire bursts out in one of the rooms, no harm can arise to the inmates. That houses are not uninflammable throughout is supposed to be owing to the indifference or incompetence of the architects. The *Times* considers architects are more anxious about the exterior appearance of a building than about its construction. We all know it is easy to make a scapegoat of an architect, and to hold him responsible for errors of which he is innocent. The Disraelian formula, "Hang an architect," has not been as yet applied in practice, but a great many wise persons firmly believe there will be no safety for all who live in houses until a few examples are made as an object lesson for the profession. Sanitary defects and absence of fireproof construction are taken as sufficient grounds to frame indictments against architects in general.

Now security against fire should be provided as far as possible by individuals who build houses for their own occupation, and it becomes more of a duty when the houses are to be let to tenants. But it is well to remember that English law does not prescribe more than a very limited provision to secure safety against fire, and it is only in times which are comparatively modern the provision was compulsory. The London Building Act exemplifies the utmost stretch of power on the subject. No doubt it has made all buildings less dangerous, but its limitations were exhibited on a great scale by the Cripplegate fire, where houses which were in accordance with the Act succumbed as quickly as the timber structures in the Great Fire of 1666. The Act prescribes that party-walls are to be carried to a height of 15 inches above roofs with dwelling-houses and 36 inches with warehouses. In certain public buildings lobbies, corridors, passages, landings and stairs are to be of fire-resisting materials. Means of escape are also to be provided in high buildings. The injunctions are not over onerous, although many building owners deem them to be oppressive. In this country officialism must not be too obtrusive, and as much as possible is left to the individual. If a man will employ fire-resisting materials throughout a building the law will not interfere with him so long as he respects the dimensions which are prescribed for inflammable materials. He can have roof, stairs, floors, partitions, doors, window-frames, girders, columns, &c., which will resist flames until the building is subjected to floods of water, but he must not seek to obtain official sanction for what he has done. His responsibilities in the eye of the law are not diminished by the extra expenses he has disbursed.

When the law is in its present condition it is hard to make architects accountable for its shortcomings, as if they were legislators who could alter enactments to suit the conditions of the time. Every citizen is supposed to be of use to the State, and consequently those who attempt suicide are punished; but although a fire may cause the death of many individuals, it is not considered necessary to adopt more than insignificant means for fire prevention. Building owners take it for granted that they are acting in a praiseworthy manner when they obey the law to the letter, and they ask themselves why should they assume more concern for the public safety than is exercised by the authorities? What they have erected may be called a death-trap or any another imaginative name, but it is a legality and upheld by Acts of Parliament and by-laws. An architect who attempted on public grounds alone to involve a client in the extra expense which is necessary whenever preventive measures are adopted would soon discover he had changed a friend into an enemy and probably lost commissions also. It should however be known by writers in the *Times* and other journals that an architect has no interest in opposing fireproof construction. Concrete, "armed cement," fire-clay blocks, terra-cotta lintels, corrugated iron and other materials may not always be pleasing to look on, but there is no difficulty in veiling them without diminishing their fire-resisting qualities. Percentages are commonly supposed to have much influence over an architect's arrangements, but the class of work of which we are speaking is more costly than what is easily subdued by fire, and the rate of commission is proportionately increased. Fireproofing is really a question for clients and municipal authorities; in the majority of cases an architect cannot suggest it without sacrificing his own interests.

Then we must take into account the question of insurance. Speaking generally, companies are not disposed to reduce premiums because measures are adopted in a building to produce safety. It is very difficult to classify buildings according to a fire-resisting scale, and for the time required for the surveys and calculations there could not be compensation. Insurance has to be treated comprehensively, and there are so many contingencies, even with the most secure buildings, it is found to be preferable to make few distinctions between them. A column encased in plaster is less likely to succumb immediately than one without protection; but what fraction of a premium should be allowed for the additional safety? From the fact that a reduction cannot be made, the building owner is likely to conclude that encasement is so unimportant it is not worth the additional expense. In that way measures for fire prevention become undervalued, and those who produce them derive insufficient encouragement.

The remedy is not to be found by alleging that architects care mainly about decorations, or by exaggerating the risks of ordinary houses. The vast number of old houses in England is evidence that several generations can come and go in safety without incurring more risk than can be overcome by a parish engine. Of late years there are new dangers, such as explosions of gas, bigger windows, increased use of woodwork. On the other hand, the means for coping with a fire have been extended and improved. If we take into account the efficiency of modern fire brigades, the possibility of destructive fires is not more apparent than formerly, although it must always be remembered that fire does not always respect the calculations made about its risks, and sometimes appears as if resolved to show their fallacy. On the whole, there is no ground for panics, but it would be more prudent to increase the chances of immunity by adopting aids of which experience has approved.

There is no reason to suppose, as the *Times* declares, that "British architecture demands, it would seem, its customary victims by fire, and the gruesome tribute is paid with unfailing precision," unless we are to take it for granted that every building in England should resemble a fire-brigade station by the quantity of life-saving apparatus prepared for emergencies. Nor is it altogether exact to say that architects "resent interference by outsiders." If they are "ingenious in giving reasons why this or that contrivance for saving life would spoil the skyline or disfigure the

elevation," it is simply because several fire-escapes are unquestionably a sight that is not delightful to all eyes. It would be more preferable to make buildings secure within than to have provision for escape outside, but as long as the Legislature will not interfere the additional expense needed for security will not be approved.

THE TURNER EXHIBITION.

TO suggest the development of TURNER'S power in seeing and representing land and sea and sky, his works ought to be shown in a polygonal gallery with sides that would correspond with the number of manners we can perceive in the paintings. The principal room in the Guildhall Art Gallery, which is now occupied with thirty-eight of his works in oil-colours, has but three available walls, and an exact classification of his methods is impossible. But by skilful hanging the pictures manifest one of the great factors which exercised influence on his style. That was light. The works on one wall, if compared with those opposed to them, appear almost sombre, while the paintings on the end wall suggest a period of transition. As generally happens with all attempts at classification of works by a man of genius in literature and the arts, no less than with works of nature, it is an error to attempt to lay down a hard and fast line of demarcation between divisions. It is so with the TURNER pictures. Whenever in these fitful days the sun condescends to illuminate them the darkest pictures assume a novel interest, and we see an abundance of detail in parts which before appeared almost monotonous. It will repay the trouble of any student of art who will patiently watch the effect of brightness and gloom on the works of a man who must have considered that nature suffered when deprived of light.

The earliest picture—for chronology is respected in the hanging—is *Kilgarran Castle*, which was painted in 1799. TURNER was then twenty-four, and had gone through a laborious education imposed by himself. The castle stands on a rocky hill, which is separated from another of similar form by a narrow V-shaped opening through which a river passes, connecting as it were the sky with the river Teif, which is in the first plane. The hills indicate that in those days TURNER was impressed with mountain beauty, and drew rocks with as much care as an anatomist would take with a skeleton. There is a replica also exhibited which is in a much brighter condition, but the only other difference we can perceive is in the laying on of the paint, and both show a treatment which would not now be considered as the most effective. *Dunstanborough Castle* was a subject which enabled him to contrast rocks and sea as worthy opponents. *A Mountainous Scene with Cattle*, dated 1802, indicates some of the mystery in cloudland which TURNER was afterwards to reveal, and another disturbed sky is to be seen in a small view of *Kilgarran Castle*. The fine *Conway Castle* also belongs to 1802. Here, in defiance of rules, he places the building in the centre of the picture, and in representing it we see that loving labour to do justice to architecture, as if a building were comparable to a work of nature, which characterises his earlier architectural drawings. When he introduced a barge on the shore, with its sloping mast, he also rebelled against an accepted principle. TURNER had a curious perversity for inclined lines, and especially with trees. He may have thought the verticality of other forms was made more emphatic in that way, but it is more likely the contrast was intended to show his disregard for an arrangement that he considered to be conventional.

The *Fisherman on a Lee Shore in Squally Weather* was exhibited in 1802. In it and in *Boats carrying out Anchors and Cables to Dutch Men-of-War* we have examples of his exact knowledge of the dangers of the sea, and of the cool courage which characterised the Dutch sailors of that time. The *Fifth Plague of Egypt*, which was painted for "VATHEK" BECKFORD, the son of a Lord Mayor of London, is probably TURNER'S earliest effort to deal with the supernatural. There is a pyramid which becomes mysterious in the white light, and there are bridges, domed buildings, &c., which resist the visitation to which trees succumb, and people who are overcome by terror. But what is remarkable is the sickliness of colour, like Death on a Pale Horse, and to sustain that view the artist gave no suggestion of the fire that ran along the ground. Another example of license or independence is the "*Victory*" *Returning from Trafalgar* with NELSON'S body. The ship is seen in three positions. In one it is black, as if suggestive of MILTON'S line, "Built in the eclipse and rigg'd with curses dark"; in another the bow seems coming on with the irresistible majesty it bore down on the Bucentaure at the head of the weather column, and on the third we see her with canvas spread. In none of the Dutchmen's works is to be found such delicate handling. The sails are defined in black, with lines or bolt ropes that might have been drawn with an etching needle. Not a reef point is missing. The rigging is exact enough to satisfy a boatswain. The general effect must originally have been more of triumph than of mourning, and probably that was the reason for introducing the blackened "Victory."

The *Scene on the Apennines* is warm in colour, and may be a transcript of something existing. It has an increased charm from the contrast with the rocks and seas of the north. The trees are as gladdening to the sight as those which are found near the coast. The *Trout Stream* might be the work of an angler. It also is, we suppose, a view, though we cannot identify the place. The *Windmill and Lock*, a work of 1806, suggests the growing delight of TURNER in sunlight. The mill itself is very dark and less picturesque than the majority of such structures, but the colour is a foil to the red brickwork of the lock chamber. TURNER was no more afraid to show the courses and to record the differences between the form of the bricks in the coping and those in the walls than he was to distinguish between the rigging of different vessels. Whatever he undertook he did thoroughly, regardless of the established canons of painting. The *Wreck of the Minotaur*, the *Nore* and *Sheerness* bring us again to the sea, from which TURNER'S thoughts could not long be separated.

Somer Hill must have been a commission from a gentleman who believed there is no place like home. It is a view of a house standing on a gentle slope beside a lake and flanked with trees. TURNER evidently entered into the spirit of the owner, and has made a picture which is as English in sentiment as any of the coast scenes. Yet it is accurate enough to be used as legal evidence. It is worth noting that the lines of the house are not exactly vertical, although when seen at a little distance they appear so. *Newark Abbey on the Wye* is, it must be confessed, freakish. It is a study in lines rather than a landscape. The abbey, unlike most of TURNER'S ruins, does not excite regret for its ruinous condition. The rude cranes on the bank of the river, the ugly barges, the contorted trees, all seem to be evidence of a mind that was not at ease, and out of vexation seized on a scene that was disagreeable. But there is compensation in the adjoining *Walton Bridge*. Here we have a large stretch of country to which the pair of bridges serve as confines, and which might be described as animated. The cattle are well drawn and grouped with skill. The river carries sailing-boats and mirrors the trees, the figures have all a purpose, and the scene is enhanced by a sunset that appears to be in keeping with it. *Mercury and Hersé* is redolent of the south. Who could care for the title? What we see is a plain, through which a river gently flows, while in the foreground on the left side are fragments of the cornice of some great temple. The eye on following the lines meets with a hill which is crowned with a triumphal arch that evidently was intended by the painter to rival the little temple of Tivoli. Yet the hill, lovely as it is, serves only to aid the marvellous perspective in which the characteristics of Italy are introduced. The picture is an anticipation of the wondrous *Modern Italy*, which is an epitome of the south. Next we come to a secluded scene, *Ivy Bridge, Devon*, with immense boulders in the foreground that suggest a war of the elements and the triumph of igneous forces, but which have only served to form a pool overshadowed with trees, in which DIANA could bathe without fear of an ACTÆON. Lastly, on the end wall we have the *Mortlake* and the *Barnes Terrace*, which are proofs of TURNER'S affection for his beloved Thames. TURNER never shirked a difficulty. In the Mortlake view it was necessary to introduce a commonplace house, the "seat of WILLIAM MOFFATT, Esq.," and a dreary stretch of wall, which still exist. He

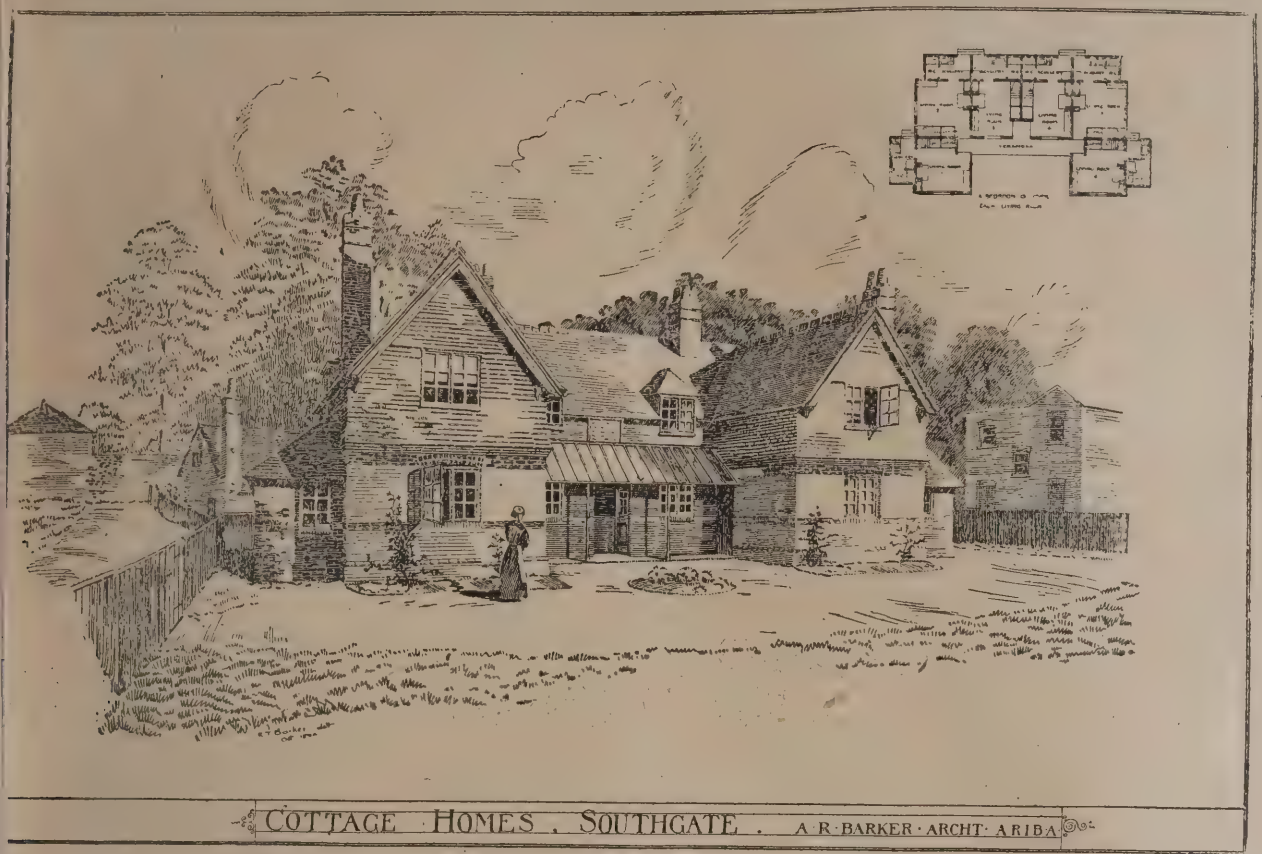
accepted them, and made no attempt to conceal their meanness. In his hands wall and house help to make the Thames more delightful. The water on which the sunlight plays becomes an expanse of silver and gold, and as placid as if a ripple had never disturbed its surface. That the same hand could have painted this water and the "yesty waves" we see in the sea-pieces is one of the marvels of art. Claude could paint the Thames at Mortlake, but he dare not attempt a picture like *Boats carrying out Anchors and Cables.* In the companion piece, *Barnes Terrace*, Turner was less hampered. He had a bit of lawn for foreground, large enough to introduce a table, a red chair, a portfolio, &c. The wall, too, was more remote. In 1827 the Corporation of London possessed rights on the Thames, and the state barges were as familiar as the Lord Mayor's and sheriffs' coaches are now in the City. The two scenes may have been sketched on one day, but in the second work the river bears more life upon it. The latter ought also to be more pleasing to the multitude, for on the river wall a dog is seen, which is not painted, being only cut out of black paper, and, it is said, by Landseer.

On the wall which follows we see examples which were produced between 1835 and 1849. They reveal a revolution in Turner's mind. In the preceding years he recorded facts, afterwards he preferred to express ideas. It is like prose which gradually becomes poetry. A comparison of a couple of pictures in one of the upper rooms with Turner's will suggest the peculiarity of his treatment. Clarkson Stanfield's *The Morning after the Wreck* is an accurate example of wave painting, the work of a man who possessed a sailor's knowledge of the sea. But it will not sustain a comparison with Turner's the *Storm*, or *Off the Nore*, which were painted four years earlier. Take another case. As a representation of architecture, David Roberts's *Grand Canal, Venice*, is as honest an example as exists. The line of buildings from the Doge's Palace to the Mint has almost the accuracy of a photograph. It is the view which would be preferred by the "practical man," and by those who can no longer see Venice with their early enthusiasm But the Venice of romance, the Venice which many of us endeavour to preserve as a memory, is seen in Turner's *Marriage of the Adriatic*, the view of the *Giudecca, Santa Maria della Salute and San Georgio Maggiore* and the *Campo Santo.* James Holland's *Santa Maria della Salute* and *Church of the Jesuits*, which are also exhibited, are more brilliant than Roberts's work; still, they do not give us the "golden city paved with emerald," which might have been the creation of artists alone. Turner is as inseparable from Venice as Titian, Cagliari, Giorgione, or Tintoret, and, indeed, his visions of the city are less material than theirs. On the same wall with the Venetian scenes are the *Rape of Europa*, in which the myth appears to be interpreted as a diffusion of light over a cliff-bound land like Britain; the *Mercury and Argus*, which is of incredible variety, and in which we can see the dark-brown trunks of the trees enlivened by occasional infinitesimal strokes of vermilion; and the *Proserpine*, which also is a panorama of a mountain district; then we have the *Sun rising in Mist*, originally known as *Fish Market on the Sands*, *Sun rising through Vapour*, a curious combination of an atmospheric phenomenon and the effect produced by it on waves, with the buying and selling of produce, business which always was respected by Turner as became an early prowler in Covent Garden and Billingsgate. We have also the *Ehrenbreitstein* with which Turner rewarded Pye the engraver. It is taken by Mr. Ruskin as "a typical instance of Turner's principle of misrepresenting facts for the purpose of representing a larger truth," but the words are applicable to almost every one of the pictures on the wall. The view of *Rosenau*, with its alleys, where water is substituted for hard roads, is also an example of suggestiveness superseding exact representation. The curious rainbows in the *Wreck Buoy*, painted two years prior to the artist's death, may also have a meaning.

There are about eighty of Turner's water-colour drawings. They were produced from time to time during more than half a century, and are as valuable exemplifications of his progress as the oil-paintings. Some were drawn when he was fifteen. His anxiety for accuracy is evident from them. The architectural drawings, such as *York Minster*, the *Chapter House, Salisbury*, the *Lady Chapel, Salisbury*, *Magdalen College and Bridge*, should be studied by all draughtsmen. They are monochromes, but the eight views in colour for the "Provincial Antiquities of Scotland," which used to be seen in the breakfast-room at Abbotsford, reveal that Turner continued to be no less exact when employing colour. Scott wrote the descriptions to accompany the views, and we wish he had given some sign of appreciating them as they deserve. We can only discover one remark, in which he says of the view of Edinburgh, "The pencil of our celebrated associate, Turner, has here given a daring representation of one of the most magnificent scenes in this romantic city," words that might be considered as expressing either blame or praise. Mr. Ruskin has lent nine of Turner's drawings, including the *Bonneville*, the *Falls of Terni*, the *Lake of Nemi*, the *Bridge of Narni*, *Rome from Monte Mario*, and the *Splugen Pass.* Fine impressions of plates from the "Liber Studiorum" have been also obtained, and the upper rooms will for many admirers of Turner have more interest than the lower gallery.

Although the space is limited, a sufficient number of examples by Turner could not, we suppose, be obtained to cover the walls. A "selection of pictures by some of his contemporaries" is therefore employed to make up the deficiency. If landscapes and seascapes like those by Stanfield, Roberts, Linnell, Constable, Nasmyth, Callcott were introduced, they would bear some relation to the chief attraction of the exhibition. Many visitors might like to realise whether Turner exercised any interest on the men around him. But the connection between portraits by Reynolds, Gainsborough, Romney and Opie and Turner's landscapes is a puzzle. It may be showmanship to offer a variety of pictures, but when they combine to form a disturbing element, as is the case at the Guildhall, blank walls would be preferable.

THE NEW MARINE DRIVE, SCARBOROUGH.



At the meeting of the Scarborough Town Council on Monday the resident engineer of the new Marine Drive reported that 37 feet of foundation blocks were set during the early part of last month, and 18 feet more in the latter part of the month, when the weather was not so favourable. He had been ordered to submit a report stating by whose authority and under whose directions he allowed the line of the sea wall of the New Marine Drive to be deviated in February of last year from the line shown on contract drawings. He now reported that early in 1898, from his experience of the average run of tides, he came to the conclusion, for many reasons, that the line of the sea wall should be brought somewhat nearer the foot of the cliff than was shown on the contract plan, and that so far as the portion which would be affected during the immediate future was concerned, an alteration of about 12 feet would be sufficient. He informed the then chairman of the sub-committee of what he proposed, and he arranged for a meeting of the sub-committee. This was held on the works on January 31, 1898, and was attended by nearly the whole of the members, to whom he explained his proposal. No member raised any objection, wrote Mr. Everett, the engineer, and "there was no doubt in my mind but that the sub-committee generally understood and approved of what was proposed." He added that so far the line of the wall had only been affected to the extent of about 5 feet, and the deviation could if necessary be restricted to that amount. No useful object, however, was to be gained by so doing, as even if the deviation were carried out in its entirety there would still be a space of about 75 feet between the road and the foot of the cliff on the portion affected.

Mr. Eaman stated that the engineer's report had been discussed at two meetings of the committee, but they had not been able to apportion the blame. None of the members of the committee seemed to remember what took place at that committee meeting when the engineer said the deviation was sanctioned, except Alderman Hall and Councillor Taylor. The Council could not fathom the mystery, but it was evident a mistake had been committed. They proposed to let bygones be bygones, but all the same before such deviation took place the full Council should have been asked to approve.

The Ordinary Meeting of the Institution of Civil Engineers will be held on Tuesday next, April 18, at 8 P.M., when a paper will be read, with a view to discussion, on "Buenos Aires Harbour Works," by James Murray Dobson, M.Inst.C.E.

COTTAGE HOMES, SOUTHGATE.

THESE Cottage Homes have recently been erected at Southgate to the memory of the late Rev. J. Baird. The work has been carried out at a cost of 1,100*l.* by Mr. Goodall, of Stoke Newington, from designs of Mr. A. R. Barker, A.R.I.B.A., of 11 Buckingham Street, Strand, W.C.

COTTAGE HOMES, SOUTHGATE. A. R. BARKER. ARCHT. A.R.I.B.A.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last at Conduit Street, W., Mr. H. L. rence, vice-president, in the chair.

The Secretary announced the decease of Mr. Edmond Egan, was elected an Associate in 1880.

Mr. H. Vaughan Lanchester and Mr. F. Lynn Jenkins read ers on

The Application of Colour to Interior Ornament in Relief.

Mr. Lanchester said that the question of form and relief was frequently of first importance that he should deal in his er with the massing and treatment both of colour and form n applied to internal decoration.

Modelled work as a basis for colour treatment gives a dity and strength that enables the painting to be kept in a re delicate key than would otherwise be thought satisfactory. e relief also is helpful in connecting the work with the uldings and forms around it in a way that no flat-painted k could do; and if the design of the whole interior is died by architect and sculptor in conjunction, the result uld be far beyond the very frequent method by which the hitect leaves a space here labelled "Sculpture" or a panel e marked "Painting." The sculptor naturally asks for as ch freedom as possible, while the tendency of the architect's a is towards formality and symmetry.

Of the spaces the architect usually puts at the disposal of decorator the frieze is the most interesting, and offers the atest variety in its requirements; it may consist of simple etition of somewhat severely conventional forms, or it may n with variety when it illustrates the great events connected place or people. The frieze, however, is not always the t suitable form of decoration to adopt, and its comparatively orm continuity of colour and modelling is not always what ost to be desired. A certain massing of either or both at vals may, without cutting it up into disconnected panels, the desirable suggestion of repetition to the frieze, and at same time suggest a sense of support or connection between r portions of the whole design. This treatment suggests eater degree of solidity and higher relief in the supporting ividing portions, though the same end might be attained iving them more severity of form. An uninterrupted frieze s length to the surface on which it is placed by the horizontal stratified effect so obtained, and the more the frieze is cut up into sections the less will the modification in proportion appear.

Vaults and ceilings give exceptional opportunities to the sculptor, though he can rarely put into them work having the same human and personal interest that the vertical surface of the wall allows, as in most cases the decoration must be of a more structural and conventional character.

With a view to suggesting the effects that can best be aimed at in various cases, the author went on to consider the actual methods of executing the work, and the most suitable colours and materials.

The combination of relief with colour is not only valuable where the figure forms the basis of the design, but can also deal in an interesting way with decoration based on landscape, architectural and other forms, varying according to the subject and the dependence placed on the relief and on the colour. If the scheme of decoration is suitable, a delightful effect can be obtained by using colour very sparingly, as mere suggestion—in ceilings, for instance, where colouring should always be delicate unless supported by very strong architectural forms. Interesting effects may be obtained where it is desired to embody existing pictures or sculpture in the decoration, such works giving a note as to treatment and colour.

Mr. F. Lynn Jenkins, in the second paper on the subject, observing upon the present craze for lavishly-decorated buildings, said that each new hotel, restaurant or place of amusement has to vie with and, if possible, go one better in point of extravagant decoration than its predecessor, and the architect must often experience the greatest difficulty in complying with his client's demands, and sometimes at the expense of his own natural good judgment and taste. The necessity has arisen for a decorative material which shall, above all, be durable and easily cleaned, being permanently coloured to any key of brilliancy and enriched with metals. These properties are embodied in the material known generally as coloured plaster relief work, and should prove almost sufficient reason for its production and use.

With regard to the prevalent mode of decorating rooms in private houses, it is becoming more and more apparent how false a notion it is, and how extremely difficult to get any satisfactory effect by papering the walls and hanging pictures upon them. The revival of the old method of designing and making such decorations as are required as part and parcel of the scheme of the room is a movement the influence of which is bound to be widespread by reason of its truth of principle, and

also because even the unanalytical mind will grow to perceive its advantage without knowing why. The use of coloured relief for such purposes would often be found most serviceable.

The author then described the material and method of its production, and the plan adopted in the working of reliefs by Mr. Moira and himself, working in collaboration. The relief work in question can in no respect be considered according to the usual laws governing bas-reliefs, but must be modelled strictly with a view to the reception of colour. The quality of the colour depends so much on the texture of the surface underneath that it requires not a little experience and many experiments to obtain good results. The peculiar properties of the material enables the painter to get a brilliant transparency of colour on some parts to contrast with the density of others, so that there are practically no limitations to handicap him. This plastic material has the additional merit of giving exact reproduction, even to the impression of a thumb-print in the finished cast. The panels are easily removable from the wall without damage to them. When the work is fixed complete in its position it is carefully reconsidered with relation to its exact surroundings, and alterations can be easily effected if desired. Some special advantage is derived in coloured relief work by the collaboration of painter and sculptor. Each would exercise a wholesome restraint on the other beneficial to the work, while the joint imagination of two minds should instil a greater degree of interest.

A number of cartoons and various examples of coloured reliefs were exhibited on screens and round the walls. They were studied with much interest by those present.

Mr. J. M. Brydon, who proposed a vote of thanks to the authors of the two papers, said they were glad to hear the various points that had been raised as to the use and advantage of coloured decoration. It was generally difficult to successfully introduce interior decoration in relief in a room, although there were no difficulties nowadays in getting reliefs in colour. The design of a frieze of this kind must from its infancy have been decorative, otherwise it marred the artistic effect of the whole room. The treatment of the panel, too, raised a serious question. In a coloured relief the delicacy of light and shade might be wanting which would be obtained from modelled forms. In all coloured work these forms would have to be conventional, for when the naturalised form was followed the difficulties increased. The question which presented itself was, What would one do with the frieze of the Parthenon if it came to be coloured? It seemed, the speaker said, that the treatment which they had seen and heard about that night was a little too restless for an architecturally-treated room. They must have been struck, the speaker continued, by the broad effect which was produced by the great use of gold, and no amount of colour would give this effect. Instead of using a multiplicity of colour, with gold and a few colours this broad effect so necessary could be more easily obtained.

Mr. Harold Rathbone also made some remarks on the subject.

Mr. E. W. Mountford, who seconded the vote of thanks, said every process of this kind of work had its difficulties, and the high glaze which was to make the pottery permanent did not seem suitable to the decoration of private houses. The whole matter was a problem.

Mr. J. D. Crace said he found little that was new in the process that had been explained to them. There was one point which should be borne in mind. The artists in the past in their works held that the work should be clear, and the ground maintained throughout neither lighter nor darker. We were apt to concentrate our penetration on technicalities, and the value of the bold and definite line was lost sight of. The speaker said he regretted that they appeared to be interested more in the technical part of the subject than in the method of line. It was really a matter of finding that which should express the forms harmonious with the architecture, and the form which should be sufficiently definite to be recognised from the distance at which the design would be ultimately seen.

The Chairman said he had not been convinced of the suitability of the glazed material for homely architecture by what he had heard. Considering the number of Owen Jones students that went out from the Institute, the Chairman said he was disappointed that there were not more interesting points raised in the discussion.

Mr. Lanchester and Mr. Lynn Jenkins briefly returned thanks.

THE LONDON GOVERNMENT BILL.

THE following letter from the Council of the Institute has been addressed to the First Lord of the Treasury:—

Sir,—The Council of the Royal Institute of British Architects, viewing with some apprehension certain clauses in the London Government Bill which affect the architectural profession, desire most respectfully to draw your attention to various points set out below, of which they would urge your earnest consideration. In the first place, however, they would point out that the Royal Institute is the statutory body for the examination of district surveyors, and that the metropolitan Fellows, all practising architects, number 295, while further, there are 545 Associates, all engaged in the work of designing and building in London, many of these being principals.

On behalf, therefore, of a responsible and representative body, the Council of the Royal Institute most strongly urge:—

1. That architects practising in London on behalf of their clients, the public, would have great difficulty in complying with the by-laws made by forty different borough corporations, and that wide differences in the administration of any building laws must ensue where there is not one responsible head as at present.

2. That it is of the utmost importance for the proper carrying out of the Building Act that district surveyors should be independent surveyors, responsible only to a central authority, and not merely officials of a single corporation, and therefore subject to local control. And, further, that the supervision of buildings should continue with them, and not be deputed to building inspectors under the control of a borough surveyor or engineer.

3. That architects having to submit their drawings for important and public buildings to the district surveyors, strongly object to subject themselves to the direction of anyone who is not a qualified and experienced architect, and independent of all local influences.

4. That the administration of the London Building Act, 1894, having worked well for so many years there is no reason for any alteration. For such a purpose London must be treated as a whole, and therefore the rules applying to the other town corporations, which are quite apart from, and independent of, each other, cannot apply to these London corporations, which are merely parts of a huge Metropolis.

5. That for the above reasons clause 6 of the Bill be entirely omitted, and the powers under clause 5 be strictly limited to matters which are local and not general.

6. That architects acting for their clients, the public, already labour under great difficulties in consequence of the very varied character of the sanitary and other by-laws at present issued and enforced by the local authorities in the London area, and that the London County Council, as the central authority, be empowered to issue to each proposed Corporation by-laws as to sanitary and other matters affecting buildings which shall be compulsory throughout the whole London area.

7. That no further splitting up of the laws affecting buildings in the Metropolis be allowed, but that rather all these be made uniform throughout the whole area affected by the Bill.—We have the honour to be, sir, your obedient servants,

(Signed) WM. EMERSON, Hon. Secretary.
W. J. LOCKE, Secretary.

ROYAL INFIRMARY, GLASGOW.

A MEETING of the executive committee for the reconstruction of the Glasgow Infirmary was held last week. Consideration was resumed of the elevation plans prepared by Mr. James Thomson for the south front of the new infirmary buildings, together with a drawing of the plan which has received the greatest amount of favour at the last meeting in February, the drawing being then suggested as necessary to exhibit the features of the plan with the greater distinctness. The Lord Provost first of all read a *résumé* of the minutes from the beginning of the scheme in March 1897, in so far as dealing with plans, to enable members thoroughly to understand the course of the committee's procedure, which had been throughout largely regulated by the views put before them by the managers and medical and surgical staff of the infirmary from time to time. His Lordship then invited a free expression of opinion on the merits of the plan before the meeting when several members stated what they conceived to be characteristics that ought to be possessed by the front building, situated as it is close to the cathedral, and that the plan, while it fully met, as was believed, internal infirmary conditions, did not at the same time harmonise sufficiently with the ancient environments of the institution. After a full and harmonious interchange of views it was agreed with unanimity that, in the whole circumstances and to prevent the possibility of after-reflection, a limited number of architects should be invited to submit elevations meanwhile of the south or Queen's Jubilee monumental front building, which shall as far as possible answer the external architectural conditions desiderated while likewise fulfilling the still more essential internal purposes the building is to serve. A small sub-committee was appointed to draw up the terms of competition and to make selection of the architects to be invited, and to report. The Lord Provost made the gratifying intimation of a further subscription of 5,000*l.*, which brings up the fund to over 85,000*l.*

The *Glasgow Herald*, with a view to show more clearly the objectionable character of the scheme at present before the executive, publishes the following resolutions adopted a

ıeeting of the staff held on April 19, 1898, on the plans then ıbmitted for consideration, along with their remarks on the mended plans considered at the meeting on March 24 ıst :—

Surgeons' Requirements.

1. There is a want of proper provision for housing and ursing separately septic and aseptic patients, and that the nly satisfactory method of securing this, keeping in view that ıe number of male cases is considerably larger than the :male, is, in their opinion, that each surgeon have three ards—two male and one female—with suitable side rooms in ɔnnection with the female wards.

As regards the provision of arrangements for housing and ursing separately septic and aseptic patients, it was noted that ıe managers have stated that they are unable to comply with ıis requirement, but have shown no alternative and have given ɔ reasons.

2. The theatres are too small and have no accommodation ɔr students and no proper accessory rooms for sterilisers and ressings.

That the provision of accessory accommodation for the eatres is still inadequate.

3. The following necessary apartments are only provided r to the extent of about two-thirds, namely :—(*a*) small side ɔms, of which there should be one for each ward ; (*b*) resi- ɛnt's room, which should consist of bedroom and sitting-room each set of wards ; (*c*) visiting surgeon's room ; (*d*) test-room r clinical clerks for each service ; (*e*) work room for micro- ɔpic, &c., research (this might be combined with *c*) ; (*f*) tients' day-rooms, of which there should be one for each ırd ; (*g*) students' cloak-room ; (*h*) splint-room ; (*i*) bath- ɔm, lavatory, &c., for the staff ; (*j*) kitchen, scullery and ıen-rooms. The surgeons suggest that most of these apart- ɛnts might be provided for in projections outside the main ilding.

(*c*) Visiting surgeon's room for each service ; shown in ɔrth house, not in east house ; (*d*) test-room for clinical ɛrks for each service not shown ; (*e*) workroom for micro- ɔpic, &c., research for each service, not shown, and if com- ıed with (*c*) not satisfactory ; (*j*) linen-rooms ; not shown.

4. The space between the beds is insufficient, being only feet, whereas it ought to be 9 feet.

Space between the beds, recommended to be 9 feet from d-centre to bed-centre ; not complied with.

5. All the surgical corridors—one of which, in the basement the east house, is 130 feet long, and the others 65 feet long are so planned that they will be dark, badly lighted and ill- ıtilated.

Corridors still dark, and unaltered except in east house sement and ground-floor, which are the only parts of the east ıck shown.

6. The plans fail to show the accommodation required for ɛcial diseases, and the surgeons recommend that they should ke provision in this respect as follows :—For the gynæco- ist, two wards (one for septic and one for aseptic cases), h theatre and other accessory rooms. For the aural surgeon, lve beds (six male and six female) in the surgical side, with use of a theatre. For the surgeon for the throat and nose, may be arranged.

Accommodation for special diseases ; the plans still fail to ɔw the accommodation indicated under this head, and which, s understood, is to be provided for.

Physicians' Requirements.

1. That each physician should have two wards, namely, a ıale ward of eighteen beds and a male ward of thirty beds; ɔ of the female beds to be in two side-rooms, and three of male beds to be in two side-rooms.

Number and distribution of beds; the recommendation has been complied with.

2. That there should be, in addition to wards, kitchen, ɔ hroom, lavatory, &c., a lecture-room and two smaller rooms ɔe used as test-rooms, bacteriological-rooms, &c., on each ır.

Test-room; not shown. Doctors'-room, if to be used for roscopical purposes, is badly placed.

3. That to provide the accommodation indicated in 1 and ıany of the apartments shown upon the plans, as being in body of the main building, ought to project behind the ding.

4. That the stairway ought to be so placed as to allow of ıteen beds being on one side and thirty on the other.

Position of stairway in block not as recommended.

5. That all the five physicians, instead of four only, as ɔosed in the plans, should be accommodated in the front se, which would require that the building, like the other ks, be six storeys high.

6. That the medical staff observe that no provision has ı made in the plans for an electrical department for the ɔital.

7. That they recommend that a special bath department be provided for the hospital.

Bath department ; a complete system not provided.

8. That they also recommend that the different blocks be connected by a subway.

Subways connecting different buildings ; no subway from reception-house to main building.

THE DECORATION OF ST. PAUL'S.

THE following communication has been sent to the Dean and Chapter of St. Paul's :—

To the Dean and Chapter of St. Paul's Cathedral.

The decorations now proceeding under the dome of St. Paul's Cathedral having given rise to much criticism, we trust that the following appeal will meet with your favourable consideration.

Although the members of the Royal Academy, the members of the Royal Institute of British Architects and other recognised authorities have hitherto remained silent, there are strong grounds for believing that they, in common with many others, fear that—in the words of the late Dean Milman—"the solemnity and the harmonious simplicity of the edifice" may be disturbed under the present scheme.

While recognising a general desire to enrich the interior of the building, we would venture to submit to the Dean and Chapter that the opinion of experts appointed by the above-named bodies should be taken as to whether the stencilling in red paint of the principal mouldings and cornices under the dome and the black lettering on the frieze are a form of decoration likely to impair the chief architectural features of the structure as originally conceived and carried out by Sir Christopher Wren.

Stanhope.	Newton.
Egerton of Tatton.	E. Poynter, P.R.A.
Windsor.	Samuel Howe.
Leconfield.	F. Cavendish Bentinck.

Dean Gregory, in reply to Mr. Cavendish Bentinck, writes :—"I can promise you and the memorialists that their memorial shall have the fullest consideration. It is satisfactory to find that such distinguished and wealthy men take an interest in St. Paul's—an interest, however, which none of them evinced when we have been collecting funds for raising St. Paul's from the discreditable condition in which it was allowed to remain for a long period of years, and which was a disgrace to the Metropolis."

WEST OF SCOTLAND TECHNICAL COLLEGE.

FOR the spring holiday visit of the students attending the architecture and building construction classes of this college Motherwell and Hamilton were the selected places. The party numbered about forty and were met at Motherwell on their arrival by Mr. Alexander Cullen, architect, who kindly acted as guide for the day. The first place visited was the Co-operative Buildings, when the large hall was much admired and also the external treatment of the building as a piece of design in architecture, and thereafter the party proceeded to the Victoria Lodging House in process of construction. Here all were much interested in the simplicity of the design, as well as its suitability for the purpose for which it is intended. Next, the recently opened Technical School in Airbles Street was visited, also designed by Mr. Cullen, where the students expressed themselves as being highly pleased with the splendid accommodation and fittings provided for the students in Motherwell. After a splendid dinner in the Brandon Hotel, the party walked to the new County Hospital, where they were met by the resident doctor, who courteously showed them the plan of the buildings, and accompanied the party while they visited an unoccupied pavilion and the various parts of the hospital which could be seen, such as the laundry, the disinfecting rooms and the sewage purification arrangements. Thereafter the Ross House was visited, where the grouping and details of this beautifully situated modern mansion were fully appreciated by the party. Hamilton Palace was reached about half-past three o'clock, and as permission had previously been obtained, the party were shown over the interior of the palace to the great delight of all. The party were greatly interested in the small details of the work as well as the larger arrangements, such as the effects of the design of the various rooms. Lastly, three buildings in Hamilton were visited—the old parish church, by the Brothers Adam, the architects ; the new Avon Street U.P. Church, by Mr. John B. Wilson, of Glasgow ; and the Brandon Chambers, by Mr. Alexander Cullen. Before parting, Professor Gourlay expressed the indebtedness of the party to Mr. Cullen for his kindness in having arranged such an excellent series of visits for them, and for having personally conducted them so pleasantly over all the buildings visited.

NOTES AND COMMENTS.

THE Sibyls at one time were appreciated in the Latin Church, and consequently their introduction as co-equals of the Prophets in the Sistine Chapel was only logical. But it was hardly to be expected that they would be an element in the wall decoration of Scottish houses until a period which was subsequent to the Reformation. Mr. THOMAS ROSS, one of the authors of the excellent work on "The Castellated and Domestic Architecture of Scotland," gave examples of the practice at the meeting of the Society of Antiquaries of Scotland on Monday. He described a series of six paintings of the Sibyls found on a wooden partition in taking down the old house of Wester Livilands, near Stirling, the property of Mr. JAMES M. DRUMMOND. The partition containing the paintings, which was of handsome construction, was divided into six compartments by Corinthian pilasters, having frieze and cornice, with the portraits of the Sibyls above, in panels about 3 feet square. The style of the paintings and of the decorations around them was quite in agreement with was to be found in many old houses in various parts of Scotland erected about the beginning of the seventeenth century, to which period the present examples might be most probably assigned. Beneath each portrait there was a six-line verse inscribed in black-letter, similar to those at Cheyney Court in Herefordshire, which were apparently about the same date. These verses give the names and the nature of the prophecies ascribed to the different Sibyls in the scheme of Christian symbolism of which they formed a part.

THE appointment of architect for an English pavilion in a foreign international exhibition is rarely profitable. According to rumour it means generally an honorary office, for the expenses are cut down to the lowest, and in such cases the architect is doomed to suffer. Elsewhere there is a different custom observed, and one which is infinitely more satisfactory. Herr RADKE, for example, has received a commission for the German building which will be seen forming part of the Paris Exhibition of 1900. The appointment brought him under the notice of the Emperor, who is not above scrutinising architectural plans. Herr RADKE satisfied the Imperial critic, and, as testimony of approval, he has received the appointment of inspecting architect of the royal buildings. We congratulate the architect, for of late years men of Herr RADKE'S profession appear out of favour with the supreme authorities of all States.

THE purification of drinking-water is a subject which occupies the attention of many municipalities. Systems are proposed from time to time, but it is generally found the cost is prohibitive. On one occasion it was shown before a Royal Commission that to properly deal with Thames water the cost would be so enormous, brandy would not be more expensive. The late WILLIAM ANDERSON introduced at Antwerp BISHOP'S system of employing spongy iron, the water being vigorously churned in cylinders with small particles of iron, with much success. At Lille water has been sterilised and purified in large quantities at the local Institut Pasteur by MM. MARMIER and ABRAHAM. They depend for success on ozone, which is found to be fatal to microbes. The idea is not new, but at Lille it has been first utilised with success. What is also important is the economy of the process. The experiments have been watched with interest by representatives of many foreign municipalities. A report was also prepared by a special scientific commission, and apparently ozonised water can be obtainable without adding much to the water-rate. It remains to be seen whether the process is suitable for all kinds of potable water. PASTEUR removed micro-organisms by means of filters of unglazed earthenware, but that was too expensive a means for adaptation to a town supply.

THE geological surveyors attached to the Department of Mines and Agriculture of New South Wales have discovered a novel use for prison labour. The colony is rich in deposits of marble, but so much attention is given to the discovery of gold that building stones of every kind receive little consideration. The gold is of great importance, for between 1851 and 1897 the value of what was found was 44,488,371*l.* In the latter year the value was 1,088,413*l.* The surveyors have resolved that marble must not be altogether neglected. They have succeeded in obtaining permission to employ the prisoners in Bathurst Gaol at polishing. The revelations have been a surprise, and it is now evident that, besides gold, silver, diamonds, emeralds and other precious stones, the colony has a most valuable supply of many varieties of beautiful marbles.

FRENCH sculptors do not appear to be eager to see their work exhibited in this year's Salon. Only 852 examples were submitted to the jury. The collection consisted of 298 busts, 65 statuettes, 300 medals and plaques, leaving less than 200 pieces to represent sculpture of a high class of composition. The jury were able to perform their duties in two days. They have excluded 350 examples. It is not likely the sculpture will this year present its usual attractiveness at the Salon, but, after all, quality may compensate for quantity.

THE French Chamber voted a sum of 3,000,000 francs towards the expenses of reconstructing the hall where the sittings of the deputies are held, and it was generally recognised that double that sum would be needed. But it has been decided to postpone the operations. The work could not be completed within a year, and it would not be wise to allow visitors to see a parliament house in a state of confusion, for that would be too symbolic of the country. The interval may allow of a reconsideration of the scheme, and those who are opposed to the erection of a new façade towards the court may in 1901 arrive at a different conclusion.

LAXTON'S "Price-book" for 1899 is so portly a volume it suggests an encyclopædia of building. From the continuous efforts of the publishers (KELLY'S Directories, Limited) to introduce improvements, it is difficult to say what size the volume will eventually attain. There are over 72,000 prices, which "are calculated with regard to the best material and workmanship, including profit and other contingencies usually taken into account." A more wonderful collection is not to be found in any country. Although abroad the price-books are prepared by societies or officials, LAXTON'S demonstrates the superiority of private enterprise. We need hardly say that the contents are not confined to prices. Memoranda given about the different classes of work, builders will find useful. Acts of Parliament, by-laws, decisions in the Courts and other information is supplied, and the whole forms an invaluable book of reference which is accepted as trustworthy.

ILLUSTRATIONS.

THE ENGLISH CHURCH AT LUCERNE.

THE growing popularity of Lucerne amongst English tourists has necessitated the erection of a new church in that city, and we illustrate to-day the building consecrated by the Bishop of London yesterday. The edifice has been erected under the auspices of the Colonial and Continental Church Society, and owes its existence largely to the energy and organising ability of the secretary, the Rev. Canon HURST. The cost of the tower and spire has been defrayed by contributions from the Town Council and inhabitants of Lucerne.

The church is situated in the Halden-Strasse immediately opposite the Kursaal, and has been built of Swiss sandstone with granite for copings and other weather portions. Accommodation is provided for 500 worshippers. In plan the church consists of the nave in one span without aisles, sanctuary, narthex and porch and vestry.

The building has been erected from the designs of Mr. FREDERIC R. FARROW, F.R.I.B.A., of the firm of COLSON, FARROW & NISBETT, of London and Winchester. The whole of the working drawings and full-size details were prepared by the architect in England, and the superintendence of the erection was undertaken by Messrs. A. BRINGOLF & H. VON SEGESSER, the contractor for the work being Mr. J. MANDRINO, of Lucerne.

XVII.

Dijon.

AFTER hearing part of the morning offices in the cathedral at Langres on Sunday, I caught a forenoon train for ijon, little or nothing of architectural interest on a large e challenging attention during the somewhat monotonous thither. The day, which hitherto had been one of un- ded sunshine, became overcast as, shortly after two, Dijon e in sight; still I was much struck with my first view of the tal of Burgundy, presenting as it does two distinct and very architectural groups, albeit the locally celebrated central e of the cathedral—for which I anxiously looked—was not idence, it having been taken down for purposes of repair. Of these two groups the western one comprises the cathe- with its pair of octagonal western towers; a church (St. ibert's), now desecrated, with a tall, octagonal tower and e like old Truro Cathedral; and St. Jean, a large aisleless iform building, with a couple of square towers flanking a t eastern limb. The eastern group embraces a tall spire, h I supposed belonged to Notre-Dame, though I was quite quainted with its outline; the imposing Renaissance façade . Michael; a Classical domed church; and sundry square rs belonging to the ducal palace. The whole formed an mble of great variety, and towards its component members stened as soon as I had set foot outside the railway station, ous to get a clear hour among them before three o'clock ers at St. Benigne's Cathedral.

To me Notre-Dame, of all the other churches of Dijon, was ramount interest. A storm was evidently brewing; clouds ust obscured the boulevards, and rain began to "spit" ously. So I jumped into a tramcar, and was soon sited, after much bumping through the older streets, in the e d'Armes, behind which the object of my journey rises. My ns of Notre-Dame at Dijon had been derived from the h of it in Pettitt's "Church Architecture with Illustrations," also from a very good woodcut in the "Saturday Maga- " of February 1, 1834, in both of which the central tower is sented as being in two stages—the lower one lofty, with lar turrets at each angle; the upper one short, arcaded, crowned by a low pyramidal capping, from which a spirelet. But "nous avons changé tout cela"; the "restorer" been here and eliminated the character which this steeple otre-Dame possessed, for he has taken away the upper altogether, replaced it by a tall four-sided spire, and has nged the circular corner turrets into gawky-looking things, ing them with pinnacles. Follies enough and to spare have committed in our own cathedrals and churches under the e of "restoration" since the Gothic Revival, but in France nischief has been ten times more fiendish. No doubt the tantial repairs carried out in her churches from one end of ice to the other during the reign of Napoleon III. enabled fabrics to resist the destroying influences of time, and out which many of them might ere this have been in ruins; he reckless manner in which such works were conducted leprived them of much poetry, to say nothing of obliterating eat deal of the history once so plainly legible in their tures. The destruction of the Middle Pointed nave chapels ns and their replacement by modern Transition work, good kind, but totally uninteresting, is an instance of destructive- quite unparalleled.

Delay the ruthless work awhile—O spare,
Thou stern, unpitying demon of repair,
This precious relic of an early age!
More fatal is thy touch than the fell rage of warring elements.

* * * * *

It were a pious work, I hear you say,
To prop the falling ruin, and to stay
The work of desolation. It may be
That ye say right: but O! work tenderly;
Beware lest one worn feature ye efface;
Seek not to add one touch of modern grace;
Handle with reverence each crumbling stone;
Respect the very lichens o'er it grown;
And bid each ancient monument to stand,
Supported e'en as with a filial hand.

To the architectural and ecclesiastical antiquary every stage in the history of a church has its value, and possesses an interest of its own, so that the obliteration of the work of any one period is like tearing out a leaf in the visible history of the structure. Of course in many instances no little judgment is requisite to discern where the historical interest ceases. Certainly it does not apply to the ill-judged excrescences, mutilations and alterations of the eighteenth and early part of the nineteenth centuries, yet many of the works of the earlier years of the former century, especially its *instrumenta*, command our admiration and respect.

Sir G. G. Scott attempted to lay down a rule that all architectural work is to be respected which is antecedent to the extinction of Pointed architecture in the sixteenth century; and this he urged, that if not taken exclusively, may be in the main right. It must, however, be admitted that some works anterior to that great change may be questionable as to their claims for preservation, and certainly some works of later date possess such claims.

I entered this noblest of Burgundian First-Pointed interiors—Notre-Dame at Dijon—by a small door opening from the Place des Ducs, and the impression it made will not readily be effaced from the tablets of memory. Although it belongs to a great cluster of churches—the outcome of that burst of enthusiasm for building which occurred during the first half of the thirteenth century—Notre-Dame at Dijon presents many and very marked peculiarities. These are especially observable in (1) the elongated, boldly-carved capitals—of the papyrus rather than the acanthus kind—which crown the tall circular pillars of the nave; (2) the unfenestrated wall behind the simple tripled arcades forming the triforium stage, as in the choir at Auxerre; (3) the employment throughout the building of large single lancets; (4) the absence of choir-aisle and procession-path, and (5) the presence of an apsidal chapel on the eastern side of either transept. There is, however, a good deal of detail work, reminding one of Rouen Cathedral, the cluster of shafts forming the responds to the nave arcade and the disposition of the great central tower piers being almost identical. Above the great arches of the crux at Dijon the tower is open, forming a magnificent lantern. Some of the shafts from which its groining ribs spring are only 7 inches in diameter to 20 feet in length, others are only 5½ inches in diameter, although 15 feet long. Frequently monolithic, these shafts are all entirely detached from the wall. In the nave, the ribs of its sexpartite vaulting spring from slender shafts which rest upon the abaci of the massive columnar piers, not being continued down them in the unpleasant but more truthful manner observable at Seez and Soissons. Each transept at Notre-Dame, Dijon, has a grand fenestration, consisting of a huge circular window, untraceried and unfoliated, surmounting a quintuplet of lancets, all filled with coeval painted glass in the Mosaic style. The manner in which the subjects are placed in roundels formed of lead-work—tracery being, as I said above, absent—is very remarkable.

The choir, short and aisleless, terminates in a groined apse, recalling in many of its features St. Peter's Church, Vauxhall, London, and of a singularly élancé character. The lowest stage of its wall is relieved by trefoiled arcades, then come tall single lancets. Surmounting these is a triforium lighted by unfoliated circles which peer through small arcades. In the clerestory are more tall lancets, where, as well as in the lower windows, is much good modern glass.

Externally the feature, par excellence, of this church is its western façade, which, instead of taking the customary gabled form, is rectangular. Although the idea for it may have been derived from Southern sources—Pisa or Lucca—this west front of Notre-Dame has a distinctly Burgundian character, its salient features being the triple arches opening into a deep porch from the street, and the two tiers of continuous arcades on slender detached shafts above. The whole composition, rising very much above the apex of the nave roof, takes the form of an elongated tower, to the extreme right of which a tourelle is perched containing the celebrated "Jaquemart"—a clock brought in 1328 from Courtrai, by Philippe le Hardi. A railing surmounts this tourelle, which is octagonal, and supports an open flèche of ornamental ironwork containing a bell.

Within the railing stand three figures, a man, a woman and a child, the two former dressed in peasant costume, but the child destitute of any garment. Jaquemart and Jaquette are

armed with large hammers and strike the hours, whilst baby tinkles the quarters with his tiny martlet. Quite a crowd—including a very portly-looking priest who was evidently "lionising" Dijon with a small party of ladies—had assembled in front of the façade as I came out of the church after a second enraptured visit about six o'clock to watch these figures go through their performance.

A little to the east of Notre-Dame stands St. Michael, with a western façade equally interesting, though of an entirely different period. It belongs to the Renaissance, and while in its outline and arrangement, *i.e.* with three portals, central compartment and flanking towers, it recalls the façades of the great Mediæval cathedrals, its details are Classic, though applied without much constructional propriety, and with but little ornamental effect. The work of Hugues Sambin—a pupil of Michel Angelo—its greater part dates from the middle of the sixteenth century, but the octagonal domed turrets surmounting it are purely Classical; they are, in fact, a century later, and rather disturb the harmony which reigns below them. In the triple portals the detail is wonderfully well imitated from Romanesque work, particularly in the small figures which form the mouldings of their deep recesses, while from the Gothic, but the change took place very much earlier than it did in England. Almost every large French town offers a specimen of this class of church, wherein the Gothic and Classic element are so intermingled that it is difficult to discern where one begins and the other leaves off. Perhaps the most imposing, as it is the earliest and most complete specimen, is St. Eustache, Paris, a structure in which we do not perceive any attempt on the part of its designer to copy Roman temples or to rival their greatness, but rather to adapt the Classical styles to Gothic forms, whereby the effect taken in the mass is exceedingly grandiose. St. Etienne du Mont, also in Paris, is another building of the same epoch, but, unlike St. Eustache, it is not a homogeneous whole of a composite style, but a building which puts forward one element in one position and one in another, the whole general effect being Pointed. St. Maclou at Pontoise, St. Pierre, at Auxerre, and St. Jean Baptiste, at Joigny, may also be taken as types of the Early Renaissance before it passed into what may be called the Jesuitical style of Maderno, Borromini and others, whose works present a rich but unsatisfactory ensemble. I refer to such churches as SS. Paul and Louis, the church of the Sorbonne and that of the Val de Grace, all in Paris; St. Charles Borromeo at Antwerp, St

Interior of Notre-Dame at Dijon.

the double inner entrance, with its figures niched between the doors, and the sculpture in its tympanum, is so clever an architectural forgery that it needs a keen and practised eye to detect it. A purist will doubtless overlook this western façade of St. Michael at Dijon as an utter barbarism, yet its otherwise "unprofitable magnificence" has its peculiar use, as showing to what extent it is possible to compensate for deficiency of purity in the minor parts by careful adjustment of arrangement and composition. Let me take a home illustration—Wren's steeple of St. Michael's, Cornhill. It is quite a study, teaching us how details, clumsily designed and unsightly in themselves, are, by the mere force of composition and by a thorough knowledge of the rules which govern proportion, made to assume an effect of singular felicity. At a short distance this tower will bear comparison with that of Magdalene College, Oxford.

In France the architecture of the Renaissance grew directly Nicholas at Prague, and many others. After this, the architecture of France settled down into the frigid Classicism of the Louis XIV.-XVI. period, when frightful ravages were made upon the Mediæval instrumenta of her cathedrals and churches—a bathos from which it did not emerge until the era of Napoleon and the restored Bourbons. Then were inaugurated to remove the excrescences of bad taste, as well as to repair the devastations of the Great Revolution, works which, although carried out with the best intentions, were seriously marred by the ignorance and incapacity of their authors.

A case in point is the abbey church of St. Denis, near Paris, whose restoration, begun under Napoleon I., and resumed under Charles X. and Louis Philippe, revealed a sad series of blunders, incompetencies and instances of bad taste, comparable with those perpetrated in our own cathedrals of Durham, Lichfield and Salisbury, through the stupid Georg

norance of James Wyatt. For instance, at St. Denis the npanum of the western portal contained a Majesty, our essed Lord being accompanied by St. Mary and the Apostles. volutionary fury had decapitated and mutilated these sacred ures. The head of Our Lord was replaced by one imitated m Jupiter Olympus. Above His head, on a cross, was cribed "INRI," letters never found upon a Romanesque npanum, while in each hand was placed a scroll with a text scripture written on it, and the chapter and verse good-uredly added; while, as the fit *comble* of all, the body of Mary was equipped with a male head, bearded and ustachioed, thus making of her a thirteenth Apostle! This s too much, and so the hirsute appendages were knocked and the head given as far as possible a feminine ex-ssion.

Later on, however, during the reign of Louis Napoleon, en half the French cathedrals were placed under restoration, ch of the well-intentioned but absurd work of the previous nasties, perpetrated at St. Denis, was undone by M. Viollet-Duc, to whom and M. Didron we are indebted for the ival and purification of Mediæval art in France, and about time that our "Cambridge Camden," afterwards the cclesiological Society," began its never to be sufficiently nked labours.

The architectural movement in England had quite a erent origin, and went further than it did abroad. With us re has been no period since the Reformation in which con-ictions, either partially in the spirit of Gothic architecture or roducing some of its details, have not been erected. Love Old Pointed art has never become extinct in England; even absurdities of Strawberry Hill attest this fact, while a nce through the volumes of the *Gentleman's Magazine*—ost the only periodical in which the arts were duly repre-ted, registering as it did all the metropolitan improvements, cribing the new churches, and chronicling all the archæo-cal discoveries—is sufficient to show that, while its con-utions betray an ignorance of technicalities, they are itedly penned, and did much towards keeping alive the ple flame of Gothic architecture in England. Warton, hop Milner and John Carter—all men of the last century—wise deserve our gratitude for what they wrote or did in the se of Mediæval art. Much of its progress, too, must be ed to the writings of Sir Walter Scott, who will earn from cerity a higher praise than has ever been the lot of any mere ary man, from the purity of his writings, and the lessons ch his readers could not fail to draw from his truthful and active portrayals of Mediæval customs and manners.

That the ecclesiological movement of sixty years ago was spontaneous growth of the English Church is a fact which will take the trouble to deny. It is an acknowledged g that, when all ecclesiastical principles seemed lost in the century, if English churches were bad, Romanist chapels e worse. In which Church did a better taste first arise? hesitatingly it must be referred to the almost simultaneous nation of the Cambridge Camden and Oxford Architectural ieties in the year 1838. Neither grave ecclesiastics nor ctical architects were among the first and most important these societies. Set on foot by two undergraduates of nity,* truths were grasped and those truths were manipulated. first a desperate battle seemed to be being waged against rwhelming odds, but ten years passed, allies were aggre-ed, architects excogitated, committees patronised, and in-duals at their private cost built churches which in richness truthfulness of design bade fair to rival the old examples. land, in fact, was moved from one end to another almost as man.

The great English ecclesiological movement had no counter-on the other side of the Channel. There the modern val of Mediæval taste has been effected under Government ices, fostered, as I mentioned just now, by the care hen like Didron, Lassus and Viollet-le-Duc. There, too, the vast works of cathedral and church restoration, extending over the country at the same time, was a Napoleonic idea, having its origin in the necessity for creating large public enterprises to keep the strong and intelligent class of labourers quiet.

With many admirable examples to the contrary, the seminary education of France cannot be said to have so developed the spirit of historical inquiry as to make the priests of that country what it has made our Anglo-Catholic clergy—good ecclesiologists. Among those exceptions we must not be oblivious of the cathedral bodies of Amiens, Bourges and Tours, who have monographed their splendid stalls and painted windows. But, taking it all round, we do not perceive among the French nation that interest in works of antiquity and ecclesiology as we do at home, chiefly from the fact that in France the Government is the custodian of her sacred buildings, thereby precluding that feeling of privilege in being constantly invited to aid in their reparation and embellishment.

The modern town churches met with in France—chiefly from their exaggerated size, the smooth stone used in their construction, and the purity of the atmosphere—do not possess the poetry of design, nor can they ever present that air of antiquity which the churches built under the Gothic revival in England so frequently assume. Indeed, externally a modern French church can rarely be viewed with unalloyed pleasure; but the interiors of such structures as the church of the Sacré Cœur at Moulins, that of La Déliverande near Caen, and those of Ste Clothilde at Paris, St. Martin at Tours, and St. Marie at Havre, are undeniably imposing from their size, and the minster-like character imparted to them by their consistent stone vaulting.

As a rule, the modern French village church is a very sorry affair, being built in most cases in a raw-looking Romanesque style, having a slate spire, and disfiguring rather than adorning the fair landscape in which it should be set like a gem.

But I must return from this rambling train of thought, into which I was primarily led by the contemplation of the extraordinary Renaissance façade of St. Michael at Dijon. The interior of this church, to which the front with its deeply recessed porches forms so grand an approach, is gloomy and disappointing, though town-like and spacious. The nave has tall arcades with shafts towards the aisles only, and is destitute of triforium or clerestory; while the aisleless choir, with its tall Flamboyantly traceried windows, either follows the traditional Burgundian plan, as evidenced in Notre-Dame and St. Benigne, or may be traced to that German influence which is so conspicuous in the ecclesiastical buildings of this eastern part of France—an influence which protrudes itself very forcibly and by no means pleasantly in Metz and Toul, whose cathedrals, deficient in artistic design, do not display that elegance of proportion and that beauty of well-considered and appropriate detail which rarely fails to satisfy the mind when contemplating the buildings of the northern and central provinces.

(*To be continued.*)

* John Mason Neale, the eminent liturgiologist, ecclesiologist, and , who died in 1866, and Benjamin Webb, who in 1862 became of St. Andrew's, Wells Street, a mediocre Perpendicular structure 347, but which in his hands became enriched with *instrumenta* the designs of almost every architect of eminence the Gothic val has produced.

THE ADVANCEMENT OF PUBLIC TASTE IN ARCHITECTURE.*

THE architect from the popular point of view is a pictorial artist on a large scale, and of all the arts his is the one most capable of prolonged effort in design, music and poetry coming next. Again, the painter will produce pictures to frame and hang on a wall to be seen only by a chosen or limited number; a sculptor will adorn a pedestal with his effort, and only those who seek it find it; music and poetry reach an increased number, but architecture as a decorative art is seen by all men at all times, and its silent influence, consciously or unconsciously, affects the minds of the cultured and uncultured.

To speak broadly, there are two faculties displayed in the architectural art—invention and imagination—one constructional and the other æsthetic. Invention has to do with the plan and scheme of a building and the relationship of its parts—the artist calling this faculty into play in much the same way as the dramatist creates characters, disposes of their destinies,

* A paper read by Mr. Siddall at the eleventh convention of the Ontario Association of Architects, and published in the *Canadian Architect*.

thinks out the course of events in his story, and sets the scenes. This can all be done by the faculty of invention. Having made the plan and settled the scheme of the structure, its heights and sizes, imagination does the rest, and clothes it with beauty. The construction will, of course, give the motive of the design. Every structural problem will be met and solved before the building is begun, and the architectural design keep pace step by step with the construction, partly modifying it and making it obedient to artistic consideration.

It is of the decorative or imaginative side of the art that I wish to speak—the side which appeals most to the public.

We are all the time seeing and handling things which are beautiful and give us pleasure, or ugly and give us pain. There is nothing, however, to compel us to look at poor pictures or distorted statues; but we cannot escape the ugly buildings which disfigure our streets. Nor can we prevent the baneful influence of such bad buildings on the minds of our children, who unfortunately grow familiar with them, and whose tastes will in all probability become as corrupt as those of the public to-day.

Considering then that architecture as a decorative art is so transcendently important, is it not astonishing that the bad architecture should have been so long a matter of indifference, or at any rate so long tolerated by the educated public?

The first question I ask, therefore, and will endeavour to answer, is, How is the public taste to be trained to a better judgment in matters of architecture—a better appreciation of art—and taught to know good architectural design from bad?

The first essential is that the public shall be induced to take an interest in architecture, and shall be educated to do so. How is this to be achieved? Not so much by talking as by doing. Not so much by lectures and papers and art criticism as by our actual work in stone and brick and wood. By the quality of the art set before it will the public taste be healthy or unhealthy. It depends, therefore, upon the architects themselves in the greatest measure whether there shall be any advancement in the popular appreciation of our art.

The next essential is closer and more friendly relations between the public and the profession. While I don't agree that the feeling of contempt that is sometimes spoken of exists, except amongst the least thinking class, it is undoubtedly true that there could be a more mutual feeling of respect between them.

It is said that culture only means the development of new relations between ourselves and the world around us—a better understanding of how one thing affects another. This can be made clear perhaps by imagining the way in which every individual would conduct himself towards the rest in a society of the highest possible culture. Courtesy would of course be the rule. Each person would recognise the welfare of the whole as of the utmost importance, and do all in his power to establish it. Nothing would be done in a spirit of selfishness or to draw attention. All would be in sympathy and work in harmony. Under conditions such as these architecture could attain to something like popular appreciation.

My second question is, Are we architects going to work in the right way to produce the best of which we are capable, or are we working under hopeless conditions, which must prevent not only any originality, but even tolerably good work?

Any art is valuable only so long as the artist can be seen in it. The inanimate material which the artist handles, be it a lump of clay, a stretch of canvas, or a heap of stone or bricks, is quickened into life by the artist's communication of his own spirit into the thing. I mean, of course, without premeditation, resulting in unconscious expression. We all know of some buildings which have been erected under conditions where the thought of the architect can be read, and his hand traced not only in the general design, but in the minutest feature. Such buildings are interesting because they have character, and they owe it to the impress of the architect's personality on his work, and it is only such that can charm and interest the uneducated as well as the educated, and that really deserve the name of architecture.

In the Middle Ages very much was left to the trained workmen which the architect—or master builder—employed, but they worked under his personal direction, and he was always on the spot to tell them what to do and how to do it, and often himself worked with mallet and chisel on the sculpture which adorned the building.

If this supervision over every part of the building was necessary then, when the architect had under him a skilled body of artisans, trained to the methods of a single school, how much more necessary must it be at the present day when he has no such traditions? They have to work one week in one style and the next in another, and then probably in no style at all. No wonder they are hopelessly at sea when left to themselves. The architect of to-day should, therefore, think no part of his work too small for his attention; everything should be thought out, studied, and the smallest detail designed as carefully as the more important.

It is hardly necessary to say that this has not been do with a large proportion of the buildings in our cities. It is melancholy fact that much that has been produced is eith positively bad or absolutely uninteresting. The buildings th are offensively bad are so from sheer ignorance or contem for the recognised rules of art, and those that are dull a stupid often are so from the mere mechanical repetition stock forms and stale ideas, which do duty for thought a save trouble of invention. With others truth has be sacrificed to whim, orders have been painfully caricatured, t details are inappropriate and often out of their proper positi —a meaningless combination of forms, freaks and devic dressed up to look fresh and clever. An uncultured a unappreciative public will call any extravagance fresh a clever until they are taught to know that there is a violation some law. But the architect who does these things wins cheap, but doubtful, reputation by pandering to a taste whi if he does not know is bad it is because his taste is no bet than their own. He does not fear to blunder in his detai because he knows there is no one to detect them. His safe is is public ignorance.

How essentially different was it when the Greek architec were building. They were encouraged or admonished by t knowledge that they were watched by the trained and cultur eyes of all the Athenian people.

Every citizen was an intelligent critic. No Greek archite could deceive the public with a false proportion or vulg profile; neither were they deceived by abundance of orname covering a weak design. Nothing but purity and perfecti obtained for the architect a reward. But when their high id of art was reached, the appreciation and applause we promptly and ungrudgingly given, and the reward—rich honour and fame.

But alas for the architect to-day who is endowed w creative imagination and a keen sense of duty—whose p fession is dear to him because of his love for his art. There little in the condition of public sentiment from which he m draw inspiration and encouragement. He will see bad wo pretty generally admired, poor work too often approved.

I now come to the question, Is not the public taste architecture retarded by a want of respect among architects each other, and for which they are responsible more or less mean an absence of professional etiquette—the esprit de co of other professions.

Some time ago I read in a professional journal of incident which occurred in the States and was singularly li one in which I was personally interested. A brother archite was in the witness-box, having been called by the plaintiff testify in certain points regarding professional charges. cross-examination the opposing counsel asked, "Is it not ve common for architects to offer to submit plans on a ventu hoping that they may be accepted?" The question w objected to by the plaintiff's counsel, but the objection was t sustained by the judge, who remarked that the architectu profession was not like that of doctors or lawyers, who ne solicited work, but that it was well known that architects w always glad to compete. The incident shows how little t architect's point of view is appreciated even by the educa portion of the community. But was it not to some extent tru The temptation to get work at any price is a constant one, a while the profession is open to anyone, irrespective of ability is not strange that good and bad should be lumped together the public in a single category.

It is true that there is a fundamental difference between architectural profession and others mentioned. A lawye practice must be a member of the Bar, the physician must h received his degree from the medical university. The ar tect, however, is let loose upon the public with or without tr ing. It is not to be expected then that there shall be resp in the public for a profession which does not discrimi amongst its own members, and which is content to let its fessional name be used by untrained individuals. Law medicine have taken measures to protect the public fron efficiency. Architecture has not.

Another element in the want of appreciation of architec as an art by the public is the established level charge for services of all—the authoritative schedule of charges sanctio by the mass of the profession.

The most carefully educated and gifted man gets no r for his services than an ignorant bungler. In other profess such as music, painting, sculpture, medicine and law, ar ability is so remunerated that there is always an incentive opportunity for still further increase, and the public den for a high artistic standard is established in these profess It is evident that the value of the work of a true artist is gr than that of the man of small ability. Moreover, the sy takes little account of the nature of the design and the am of brain work required to produce it; the carefully studied elaborate detail of a first-class residence is of no more v judged by the existing standard, than the unadorned sc house or barn.

writer in one of the papers has summed up the question in words:—"By the present mode of payment the public refuses to recognise the difference in the artistic capacity lividuals; second, it refuses to recognise the artistic nce in widely varying services rendered by the same dual; and, third, it refuses to pay the architect in a way ill enable him to give its work his best attention." But rangest anomaly of all is, that the financial interests of chitect and his client are diametrically opposite. Take se of a building of the normal value of, say, 50,000 dols, mmission for which would be 2,500 dols. An architect led and giving little thought to his work would probably 60,000 dols. in carrying out the work, for which he would id a commission of 3,000 dols. Another architect by ht, labour and diligence, and making various studies and es in his drawings, is enabled to reduce the cost by dols. His faithfulness and care are rewarded, not by payment for extra study and labour; he receives no pay- it all for that, and the original commission is reduced by ols., 5 per cent. on the amount saved for his client. etter he serves his client the more his commission is d.

recapitulate and conclude, I would say that before we cts accuse the public of being indifferent we shall ll to look at home and see whether the work we ut has any real claim to be interesting, and before we that they do not know good work from bad, it is our ss to ask ourselves whether we have given them a fair of seeing what good work is. We shall educate them critics by giving them good and faithful work as a rd by which to judge the quality of the whole, and we pend that every piece of really meritorious work will be ect lesson for the education of the popular taste and appreciation.

IBURGH ARCHITECTURAL ASSOCIATION.

MEETING of the Association was held on the 25th ult. in the Royal Institution, Princes Street, Mr. Thomas president, in the chair. After the minutes had been read, mes Bruce, W.S., referred to the honour recently conupon Mr. M'Gibbon, an ex-president of the Association, University of St. Andrews, and moved that they express ise of their high satisfaction that St. Andrews University en fit to confer the degree of LL.D. on Mr. M'Gibbon. ught it reflected great credit upon St. Andrews to have d one so well worthy of receiving a high academic . The motion, which was seconded by Mr. Kerr, archias cordially agreed to. Mr. Campbell Irons then read a on the "Architectural Antiquities of Leith." In the of his lecture, which was illustrated with limelight views, ons said one of the difficulties he had had to contend as the paucity of architectural features in Leith. It be idle to go to a small seaport on the east coast of d in search of noble examples in architecture. He nly say in the words of the Apostle, "Silver and gold none, but such as I have give I unto thee." The origin h was wrapt in mystery. The first reliable mention of t was in the foundation charter of the Abbey of Holy- House, granted by David I. in 1128, in which it was that the first house built in Leith was erected in the century. The lecturer proceeded to give descriptions old buildings as Leith possessed or still possesses, and various anecdotes referring to the owners and occupiers e. By means of the lantern a large number of illuss of the antiquities of the port were shown, and at the f his address Mr. Irons received a very hearty vote of .

MUNICIPAL COUNTY BUILDINGS.

E Mid-Lothian County Council have invited architects to submit competitive designs for the proposed new county gs. In their printed conditions of competition the l offer two premiums—the first of 100*l.*, and the second ; and it is declared that if from any cause the buildings proceeded with, and no drawings other than the com- drawings have been prepared, the selected architect eceive a payment of 200*l.* in full of all claims. It is e stated that any design which is estimated to cost more ,000*l.* may be disqualified. The available site specified es Liberton's Wynd—that is to say, the buildings may ght forward towards the existing pavement on the east Melbourne Place; on the north or High Street side, ain on the east or Parliament Square side, the new struc- ay be brought out as far as the railings which enclose sent building; at the south-east corner the buildings me out to the lane that skirts the Signet Library at oint; whilst towards the south they may run down s the line which divides the County Council site from the low-lying open ground belonging to the Advocates' Library. In regard to the Ionic portico, which is so conspicuous a feature of the Parliament Square elevation of the present building, competing architects are expressly asked to consider whether it is desirable to retain it in its present position or in any other position in connection with the new building; and while the Council are entitled to build up to the limits of their ground, competitors who consider it desirable to remove the portico are requested to have regard to the general amenity of Parliament Square in the building line which they may adopt for the east front of the new building. In the statement of accommodation required mention is made of a council chamber for forty-one members, two committee-rooms and a county councillors' writing-room; offices for the different county officials and their assistants, and for the headquarters staff of the county police; a public office for the collection of rates, and a justice of peace court-room, with a floor area of 1,250 square feet approximately. It is suggested that the justice of peace court and offices might be placed on the southern part of the site and in a building of less height than the other parts of the structure, so as to interfere as little as possible with the windows in the west end of the Signet Library. The designs are to be lodged with the county clerk by June 27.

MOORISH ARCHITECTURE AND ART.

A LECTURE was delivered at Preston on the 22nd ult. by the Rev. C. F. Richardson, B.A., LL.D. (late superintendent minister of the Lune Street Circuit, Preston), on "The Moors in Spain," before the members of the Preston Scientific Society, at their rooms in Fishergate. Mr. Yates Booth, J.P., presided over a good attendance.

The lecturer began by describing the Moors in Africa, dealing at length with their architecture, numerous specimens of which were thrown on the screen by Councillor Margerison. Mr. Richardson pointed out their perfect proportions, rich ornamentation and the peculiar horse-shoe shaped arches, to be found in all the buildings. All the ruins found were not of Saracenic origin, some being traceable to the Romans. Those stately buildings were built by the Moors, but not the mixture of Berber, Arab and Negro, which to-day were called the Moors of Morocco. They were the memorials of a vanished race, which for more than seven centuries were lords in Spain, and for more than two centuries were the most civilised race in Europe. It was almost impossible to realise that after a sway as long as from the time of William the Conqueror to the middle of the reign of George III., and a state of pomp almost unparalleled, they vanished like a dream. Whence did the Moors get the art of building? They got an answer by examining the great Mosque at Damascus, on which was the inscription, "The kingdom of Christ is a kingdom of all ages, and Thy dominion is from generation to generation." It was a whilom Christian Church, and one of those that were filched at the Conquest from those of our faith. The art of the Moor was the child of once Christian Constantinople, of Greek Christian art, but transformed by a fiery race of enthusiasts. The lecturer then passed on to the rise and fall of the Moors in Spain, and excellent views of their chief buildings, notably the Alhambra, were shown, and their chief features pointed out. A number of amusing legends connected with the places described were well told.

A hearty vote of thanks was given to Dr. Richardson.

PLASTERING—PLAIN AND ORNAMENTAL.*

I PROPOSE making a short review of materials before taking up their use and application. The first is lath. My experience calls for great care in the selection of this material. A soft white pine that will stay where it is nailed is my preference. It should be seasoned, but not necessarily dry, and have a straight grain. When a dry lath is coated with mortar it must necessarily swell, and when it dries again it must shrink. A lath which is not thoroughly dry will not have so much shrinkage and will have a more secure key. Wire lath nails 1½ inch long are what we generally use; there is no advantage in having them heavy, but they must have a good flatted head. Metal lath is now offered in many forms; I do not intend to indicate my preference; there are several good articles on the market. I will merely ask you to examine samples in the full sheet—note the stiffening; they should be rigid every way. Satisfy yourself as to the key and effect upon it of a settlement or shrinkage in the building, and always have it painted or galvanised. Wire lath is good—it is almost all

* A paper read at the eleventh convention of the Ontario Association of Architects by Mr. W. J. Hynes, and published in the *Canadian Architect*.

key. It is more expensive to buy, apply and cover than metal lath, and for that reason is not so much used.

Lime mortar is in general use, and most of our specifications for the preparation are taken from English authorities. I will not attempt to give you the theory of lime—most of you had a full explanation of that in your student days. I think that the Architectural Chair of our University might devote some attention to the examination of the various limes offered in our market, with the proper proportions and description of sand they will carry. Until such time as this is done, I would advise you to have your work done by contractors in whom you have confidence. Good work can be done with lime, but it is a very variable article ; we are well served in Toronto, but some very bad limes are used in the country. Our mortars are mostly made from grey lime ; they are cool in working, and should be given ample time to thoroughly slack before mixing with sand. Haste upon the part of the mortar man, or a tendency to stir up the mass before it has slacked, will most likely result in lime pitting on the finished wall. In some lime, or in fact in all lime, if not properly burned, there is a great danger from this. There seems to be an underburnt core which very often disfigures good work. As this generally occurs in winter work the cause is more often with the mortar man than with the lime itself ; but, be as careful as you may, it will occur sometimes.

Lime putty is made from white lime, generally called fat or rich lime. It is run in large vats, and should stand a month or more before using. This material has no strength in itself and requires to be mixed with sand or gauged with calcined plaster before use.

Hair is necessary for mortar for use on lath-work, and a smaller quantity is of decided advantage to the straightening or browning coats. It should be clean, well saved, long, winter cattle hair. Hemp, sisal, palmetto fibre and many substitutes are used instead of hair in other places, but are not offered on our market.

Calcined plaster, the most useful of our materials, is used for many purposes. By mixing one-fifth to bulk with lime putty we obtain the compound for what we call "hard finish." A greater quantity mixed with the same putty allows us to form run mouldings. Where the thickness of moulding is too great to use putty and plaster the work is cored out with mortar gauged with plaster. Quick work can be done by gauging the first coat of mortar in plastering to admit of finishing at once.

Its greatest use is in moulding and casting decorated ornaments, staff and fibrous plaster-work. The property it possesses of swelling when setting serves to give us most faithful and accurate copies from any original, hence its extensive use in fine art. In addition to this, calcined plaster forms the basis of nearly all the patent or prepared plasters. By the addition of retarding and hardening compounds its setting is delayed sufficiently to allow of mechanical manipulation, while its ultimate strength gives a much stronger wall at once than can be obtained by using lime. My own conviction is that in time most all our work will be done in those materials or with machine-made mortars whose proportions are fixed and accurate. Plaster is also the base for the white cements, such as Keene's, Parian, Martin's and others. I do not consider myself an authority upon these cements, and shall not dwell further upon this than just to say they are perfect goods, make perfect work and deserve much more attention than you have given them.

Before speaking of lathing I have something to say about the necessary preparation therefor. The genius who first conceived the idea of making the plasterer responsible for the carpenter work by a clause in the specifications calling on him to examine all studding, strapping, &c., before lathing, and if not found correct to stop and report same to the architect, could not have grasped all the facts :—1st, the carpenter is a bad man for the plasterer to fall out with ; 2nd, tale-bearing is not congenial work ; 3rd, lathing is done at the rate of 2 or 3 cents per yard by a boss lather who is hustling a gang to make his work pay. It is easier and cheaper for him to get over the carpenter's bad work than to lose time and report it. If the angles are not solidly nailed the lather is not likely to do it ; if a line of joisting demands the cutting of 8 or 10 inches off the lath for a long distance, the chances are the lather will find a convenient board or scantling, place it where the joists or stud should have been, and make his nailing to this loose piece, trusting to the lath nails to hold it until plastered. This is bad —very bad—but who is to blame? I say the architect is. If joisting and studding are not sized, and one bulges below or forward of the others, it is easier to add on a few laths and give the wall or ceiling a graceful but incurable curve than to wait on a carpenter to trim it. Kindly examine the carpenter work yourself ; don't dodge or depute your responsibility.

Have your lath laid in bays with breaks every 15 inches. Have a $\frac{3}{8}$-key on walls and slightly larger on ceilings. Do not allow carpenter work to force the use of vertical lath. Have heavy timbers counter lathed. Do not allow laths to break over door post ; slamming that door will break the plaster. Use plenty of bridging on joisting and studding. Strap all ceil Have false arches and beams made very rigid with as timber in their make as possible. See that all junctio wood and brickwork are nailed very solid, and have covered with metal lath ; 16-inch centres is the greatest dis that should be allowed for $1\frac{1}{2}$ lath ; it is too great for lath ; they should have 12-inch centres. Try and have work so correctly planned that the lather can make mone will give you a good job with pleasure. The only way I to do this is to have that greatest of all boons on a build good carpenter; the only way to get one is to give him a paying price. He wants to live, too.

Now before the mortar is applied, before even the lath started, any ordinary good job should be well prepare grounds. This is generally done badly, and the result always to be seen before completion. The entire details interior finish should be made before this work is done ; it only way if you want it correct.

Perhaps I have been too lengthy on this particular que but I wish to impress upon you that good plastering dem solid, firm and well prepared work to secure it. I am not to tell you what bad plastering requires, but your chanc holding up bad work are good if work is prepared properl

If, as I have suggested, the details have been prepare grounds fixed, a very definite idea will have been formed character of each portion of your building, and you can nitely specify the proper finish. Two-coat work is most ge It is sufficient for ordinary rooms to execute this work often specified—plumb, true and straight is not possible. coat of mortar only can be finished with that wonderful to call a "darby ;" it is a great implement for effecting a g levelling up, but don't try a straight-edge on work left afte

Hard white finish is made by gauging lime putty wit cined plaster and trowelling it to a finish before it sets. haps some of you have discovered that hard white fi misnamed—the hardest lime finish is never white ; the str of this coat is improved by the addition of sand.

Now if your work is to be decorated, if expensive pai and paper are to be applied to it, you should hesitate placing them upon work that is neither straight nor s Three-coat work admits of proper straightening. It wi on ceilings generally guard against the danger of seeing joist and lath some time after work is finished, and furt gives you an opportunity to finish it as your work demand

The best hard finish is made with lime putty and thoroughly tempered and applied to the straightened c mortar. It is first laid true, then very thoroughly water f or scoured, and finally trowelled and retrowelled until a is secured. It is then dry brushed. This work is smoot true enough for any painting, hard and firm enough fo paper.

Bastard stucco is done in very much the same manne the trowelling only progresses far enough to secure a pa smooth wall. As its name implies it is neither trowelle nor rough stucco. This makes strong work, admirably a for either paint or paper.

Rough stucco used on exteriors, hallways, churches public and semi-public places, is generally executed coats—the first being heavily scoured, the second brough finish in one operation. Three-coat work admits of a stucco; the work being straightened in the second coat of a great variety in texture of the finished stucco. Yo have it left very rough with all the indications of floating with the graceful sweeping lines and curves, this work made very effective—or you can have it finished of a g matt surface of great uniformity and evenness. Vaults, intersecting groins—especially where finished without ings—are best done in this work.

In speaking of stucco I use the term as generally by the trade to the rough-floated work I have been sp of. I would like to see the use of this word in specifi somewhat limited. In its literary sense there would s be no limit.

I have worked in Toronto twenty-seven years. not now, as formerly, carry a few stock cornices of each tect's design ; I am not ordered to run same mouldi same centres, brackets and such stock work on each suc job. Your opportunities to individualise your work lie ordinary everyday problems you handle. How much to give each client something of his own instead of fur him with a duplicate of a previous work. Why not f the modern decorator and make him follow lines dicta architectural study, than have him run riot with colou attempt to decorate an impossible interior?

My earliest recollections of cornices are of a hug following closely to the angle of the room ; below was mass of mouldings, their size, no doubt, the result of computation on the amount of dust it could carry. T completed by a similar collection of heavy mouldings ceiling. Such a room was not complete without a flower, which must, of course, conform to the size and s

)m. We had to fix with plaster huge ornaments 5 and oval and circle as was thought necessary, and from es to 12 inches deep. These had beautiful strong ut ornaments that held more dust that was impossible of ion. Well, some of these are still up; some have caused ughter; many have helped the sale of china and furni- Time taught us this was not safe, and the next result attempt, under the sacred name of good Queen Anne, as many members as possible into a given space and he pitfall of our predecessors by making this as light as e. With this came a revival of the run centre, and we)rced to form mouldings around gas-pipes that were fear- ıd wonderfully designed. From my vantage point before :an say many things that I would not like to say to you ually—the cap might fit. Those of you who caused hings to be done were, no doubt, like myself when work- this, under the impression that we were executing archi- I work instead of perpetuating architectural monstrosi- What I want to impress upon you to-day is that you are chers, the leaders. Even the jerry builders look to you ıters.

t all know the method of run work. I will not describe would request that you study the limitations of the mate- d have brackets provided for your mouldings and not sk of the work falling by overweight; the best work not average 1 inch thick.

: World's Fair at Chicago first placed before the pro- the merits and demerits of staff. The name was new, ing use of the materials new; but the use of fibre with was familiar to European mechanics for years previous As used in the White City, it was exposed to the ts; it was hastily nailed in position by any workman tractor could secure, then hastily painted. Lines were y, intersections not exact or true; the general effect was d, and it was successfully secured. Perhaps this very ness that I mention helped the effect; they certainly remote resemblance to the varying and inexact lines of ly artist plasterer, whose work was all by hand in posi- d carried with it that peculiar and indescribable effect ndwork always does.

s staff is now before you as a commercial substitute for ı mouldings. The cost is nearly alike, unless when quantity and richness favour the staff, or a small y and comparative plainness help the older method.

staff work you will have to think out your design— g the material; the best effects are plastic, the true of the material. You need not have a smooth moulding; bing and corrugating we vary the texture so that even a oulding may display its design with a side-light without

n your detail the model is finished complete in the shop. pproval it is cast in plaster. While this mass is setting amount of fibre or serim-cloth is embedded into it; this us to make large and strong casts. A frieze which I or the Conservatory of Music here was 12 feet by inches, and cast in one piece.

ar my subject is too much for me. I would sooner do k than talk about it. What I would like would be to give d every one of you a sample from your own details. I that this method of work is here to stay. It is light ong, comparatively cheap, and will stay where fixed. st of our substitute for the sheet metal ceilings is not reater than that very undesirable article; of course it drawback of repetition, but under good design this may e an advantage. I shall leave to your professional training nowledge the matter of design; my object will be l if I can make you regret the wasted opportunities of t and inspire an anxiety in you to do better in the future.

TESSERÆ.

Aristotle's Philosophy of Art.

is defined by Aristotle as the realisation in externa orm of a true idea, and is traced back to that natura imitation which characterises man and to the pleasure ve feel in recognising likenesses. Art, however, is not to mere copying: it idealises nature and completes its cies; it seeks to grasp the universal type in the ial phenomenon. The distinction, therefore, between rt and history is not that the one uses metre and the t, but that while history is limited to what has actually d, poetry depicts things in their universal character. itation may represent men either as better or as worse en usually are, or it may neither go beyond nor fall ne average standard. Comedy is the imitation of the pecimens of humanity, understood, however, not in the f absolute badness, but only in so far as what is low and enters in what is laughable and comic. Tragedy, upon er hand, is the representation of a serious or meaning- full, rounded or finished, and more or less extended or far-reaching action, a representation which is effected by action and not mere narration, and which is fitted by portraying events which excite fear and pity in the mind of the beholder to purify these feelings and extend and regulate their sympathy. Such a "Katharsis pathematon" is well termed by Zeller "a homœopathic curing of the passions," and we may further accept his theory that art being, as we have seen, a universalising of particular events, it follows that tragedy in depicting passionate and critical situations takes them outside the selfish and the individual standpoint, and views them in connection with the general lot of human beings. In a partly similar sense Aristotle explains the use of the orgiastic music of the worship of Bacchus and other deities as affording an outlet for religious fervour and so steadying our religious sentiments.

The Elephant of Catania.

The diligence of Professor Holm has brought to light one or two scraps both of Byzantine and of Saracenic work lurking in the streets and lanes of Catania. But no Byzantine or Saracenic building remains. There is however one work of art which, if we can believe the local legend, belongs to the days of Byzantine rule, but which by no means comes within the standard of Byzantine orthodoxy. The elephant wrought in lava, with tusks of white marble, which in later times has been set to carry an Egyptian obelisk in the place before the cathedral, is held in local belief to be the work of a certain Diotro, Diodoros, Liodorus, or Heliodoros, who in the eighth century turned Jew, practised magic and became a manufacturer of idols. The Jews of Catania were a numerous and a proselytising body in the days of Gregory the Great; but, whatever may have been their misdeeds, it is hard to charge either them or the Saracens with being makers or worshippers of idols. But this Sicilian forerunner of Lord George Gordon was a mighty necromancer indeed. He turned men into beasts, and, when he was carried to Constantinople to die for his crimes, he escaped the vigilance of the Imperial police by flying through the air back to his own city. But there he met with his match in the Bishop Leo of Ravenna, who, as himself a worker of wonders through holier influences, bore the surname of Thaumatourgos. Heliodoros, once, it is said, a candidate for the bishopric, was burned, not indeed in Ætna, but in some lowlier furnace of fire. The modern historian of the Sicilian Mussulmans sees in this tale a legendary account of the last destruction of heathen monuments by Christian hands. But the elephant, whatever may be his date, is there to speak for himself, not only in his own person, but in the place which he bears in the arms of the city. The obelisk which he has borne for the last 150 years has no natural connection with its bearer, nor is it obvious why an Egyptian work should find itself among the ornaments of the Sicilian city. An explanation has been found in the fact that Agathokles had an Egyptian wife Theoxena, who, it has been guessed, was the stepdaughter of the first Ptolemy. Agathokles may have received an obelisk as part of her dowry, and he may have set it up at Catania. At any rate the work of the Egyptian is there, mounted on what passes for the work of the convert to the creed of the Hebrew.

The Legh Brass, Macclesfield.

In the Rivers Chapel of St. Michael's Church, Macclesfield, is a brass which is a memorial of Roger Legh and his wife. This brass is much mutilated, the figure of the lady being altogether gone; it has but little pretension to beauty, indeed is very coarse and rude in execution. It consists of the kneeling figures of a gentleman and six children, in the long gowns then worn by civilians; an inscription beneath, in Latin, states that Roger Legh deceased November 4, 1506, and Elizabeth, his wife, October 5, 1489; a label from the mouth of the principal figure has on it, "a damnatione perpetua libera nos, domine;" one corresponding from the female figure, which is preserved in a drawing, Harl. MSS. 2151, British Museum, ran thus:—"In die judicii libera nos, domine." But the most interesting feature, the only one which renders this monument of any value, is the curious representation which appears above the heads of the figures. Here we have exhibited an altar on which is a chalice and missal; before it kneels a figure in the triple crown, a nimbus round the head, and vested in the priestly habits worn at the celebration of the Mass. Behind the altar is the figure of the Saviour, arising out of a sepulchre, and hands uplifted as displaying the wounds of His Passion. This is a representation very common in missals, and well known to ecclesiastical art, but not found, except in the present instance, on monumental brasses. The subject has reference to a passage in the life of St. Gregory the Great, which is given in old missals on St. Gregory's day, and is often illustrated both in MSS. and in early printed copies. It is called St. Gregory's Mass, or St. Gregory's *Pity*, and is one of those numerous legendary stories of miracles performed in confirmation of the doctrine of transubstantiation. A very interesting piece of sculpture, representing the same story, is

found in Stoke Charity Church, Hampshire. The variations in the treatment of the subject from that of the brass at Macclesfield are that St. Gregory is represented as a bishop only; his mitre is deposited on the altar, and he holds in one hand the chalice and in the other the consecrated host. Opposite to him is the figure of an attending priest, and behind the figure of the Saviour is a piece of drapery held by two angels issuing from heaven. The same subject, in sculpture, is to be found also in a chantry chapel of Exeter Cathedral; it is much defaced. In this the figure of the unbelieving woman is introduced, and behind the figure of the Saviour are the cross, crown of thorns, and the other implements of the Passion. A very elaborate design is also extant from the story, by Albert Dürer. The literature of the Middle Ages abounds with tales of the miraculous host, all having the same intention—that of conversion of unbelievers to the doctrine of the real presence; many of these relate to Jews, and one of the earliest is found in Evagrius and of the sixth century. One of the most celebrated paintings by Raphael in the Vatican—*The Mass of Bolsena*—is from a similar legend.

Art in Daily Life.

Must not beauty be sought for in the forms which we associate with our everyday life? Yes, if you do it consistently and in places where it can be calmly seen; but not if you use the beautiful form only as a mask and covering of the proper conditions and uses of things, nor if you thrust it into the places set apart for toil. Put it in the drawing-room, not into the workshop; put it upon domestic furniture, not upon tools of handicraft. All men have sense of what is right in this matter, if they would only use and apply that sense. Every man knows where and how beauty gives him pleasure, if he would only ask for it when it does so, and not allow it to be forced upon him when he does not want it. Ask any one of the passengers over London Bridge at this instant whether he cares about the forms of the bronze leaves on its lamps, and he will tell you no. Modify these forms of leaves to a less scale and put them on his milk-jug at breakfast, and ask him whether he likes them, and he will tell you yes. People have no need of teaching if they could only think and speak truth, and ask for what they like and want, and for nothing else; nor can a right disposition of beauty be ever arrived at except by this common sense and allowance of the circumstances of the time and place. It does not follow because bronze leafage is in bad taste on the lamps of London Bridge that it would be so on those of the Ponte della Trinita; nor, because it would be a folly to decorate the house-fronts of Gracechurch Street, that it would be equally so to adorn those of some quiet provincial town. The question of greatest external or internal decoration depends entirely on the conditions of probable repose. It was a wise feeling which made the streets of Venice so rich in external ornament, for there is no couch of rest like the gondola. So, again, there is no subject of street ornament so wisely chosen as the fountain, where it is a fountain of use; for it is just there that perhaps the happiest pause takes place in the labour of the day, when the pitcher is rested on the edge of it, and the breath of the bearer is drawn deeply, and the hair swept from the forehead, and the uprightness of the form reposes against the marble ledge, and the sound of the kind word or light laugh mixes with the trickle of the falling water, heard shriller and shriller as the pitcher fills. What pause is so sweet as that—so full of the depth of ancient days, so softened with the calm of pastoral solitude?

Popularising of Styles.

When a new style appears in a country it must either have been invented in that country or have been introduced from some other. In the first case it appears probable that the invention will be made by successive steps, and that regular transition buildings will be the consequence; but in the second case, as the new style is supposed to be brought in complete, it appears at first sight as if there ought to be no transitions; still, something like them may be supposed to be produced in the following way. It would only be on occasion of erecting some building of greater magnitude than usual that foreign artists would be employed, and these would naturally produce a complete specimen of the style then practised in their own country, and, we will suppose, totally differing from that habitually made use of. This new work would, of course, create a great sensation, and everybody would be for following the new fashion; the native architects, driven to imitate the new style, would produce specimens in which new and old would be mixed in different gradations, according to the skill of the individual and his power or opportunity of mastering the new principles. Some, too, would persevere in their old practice, while the foreign artists would also be employed in erecting other buildings; so that at the same period of time and in the same country we should have buildings in progress, some in the old style, some in the new, and others in every possible gradation between them. These may be called imitation specimens, to distinguish them from regular transitions. This employment of foreign artists is commonly alluded to in old chronicles, and the sensation which th works excited is mentioned in passages of this kind, which ha been quoted in the well-known treatises of Bentham, Hawk and Murphy, and serve to show that the above representat is not exaggerated.

Roman Construction.

A singular class of monuments that throw much light the history of Rome are the tombs. As an Indo-Germa race, it is not a little startling, at first sight, to find them p sessing tombs at all; but when we bear in mind the str Etruscan element that pervades all their civilisation, and pe out now and then when least expected, their tombs not o become intelligible monuments, but, under the empire, repres the element which, so far as written history is concerned, lose sight of on the extinction of the early kingdom. As wo of art they are generally better than most other Rom buildings; indeed, they seem to have copied the Etrusc tomb or Grecian cenotaph, with far less attempt at their o clumsy invention than in almost any other class of buildin and some of them are of considerable beauty and suital solemnity of appearance. It is true, however, that they are completely ruined that we have but little means of judging what the true effect of the great ones of the empire must ha been when complete; and one cannot help suspecting th like everything Roman, they are far more beautiful in de and ruin than when displaying the georgeous vulgarity of th designers. The taste displayed in them was probably bad, still not without a sense of that power which sheds a mel choly tinge of greatness over everything Roman—even crimes. Generally speaking, the greater ones, such as th of Augustus or Hadrian, or that of Cecilia Metella, w circular in form, like the tumuli of the Etruscans, which th resembled in most respects, only that with the Romans, might be expected, the low circular basement that surrounc them was magnified into a principal object, so that at last th assumed more the form of a circular tower with a conical r than that of a tumulus. In their smaller tombs the Rom copied the rectangular rock-cut or structural tombs of th prototypes, only adding a few inappropriate pilasters or thr quarter Greek columns, so as to spoil the simplicity of th effect, but at the same time to mark them as truly Ron works of art. On the whole, perhaps, the best and only rea satisfactory works of the Romans are those we usually releg to the engineer; their roads and bridges, their aqueducts a ports, and their fortifications, are conceived on a scale a executed with a solidity worthy of the greatness of the empi These they derived solely from Etruria; the Greeks offe them nothing which they might incongruously mix with the Besides, the exigencies of the works of this class kept th vicious taste in restraint, and they went to work, in this ca with an earnestness of purpose and distinctness of aim, a consequently carried them out with a far better feeling th that which pervaded their more ambitious, and what t attempted to make more artistic, productions.

GENERAL.

M. Léon Bonnat will be represented in this year's Sa by a landscape. His portrait of President Loubet, which to appear, has yet to be commenced.

A Paper on "Inlaying" is to be read by Mr. Step Webb at the meeting of the Applied Art Section of the Soc of Arts on Tuesday next.

The Maison du Peuple, which was inaugurated last w in Brussels, is said to have cost nearly two million of fra It is intended to be the headquarters of the Belgian Sociali

Mr. W. D. Caroë was requested by the trustees under Liverpool City Churches Act to advise them upon the prop demolition of St. George's Church tower; but after the dec of the City Council, they have decided not to oppose removal of the structure.

The Salon Jury for awarding medals and prizes for a tecture will consist of MM. Pascal, Loriot, Laloux, Dau Mayeux, Redon, Coquart, Vaudremer, Raulin, A. Norm Moyaux, Scellier de Gisors, Guadet, Paulin.

The Executors of the late Mr. Pyke Thompson agreed to give 3,000*l.* to build the Fine Art wing of proposed museum at Cardiff.

Charles Yriarte, who died a year ago, was engaged literary and artistic study of Isabelle d'Este and the of Mantua, which he considered as his most important w Although completed before his death, this important att to explain one of the influences of the Renaissance ren unpublished.

A Bill promoted by the Corporation of Newcastle-on- seeks powers for the expenditure of 770,000*l.* on street provements.
